Also, a CAPITAL FARM of FIVE HUNDRED and THIRTY ACRES, in Berks, Seventy-four Meadow, Seventy-four Down Pasture, remainder Arable, with excellent Premises.—Rent, tithe free, 315*l.* a year.—Near the Great Western Railway.

Another in the same County, nearly FIVE HUNDRED ACRES, considered the best Farm in Berks; near a Station on the Great Western Railway.

And another of FOUR HUNDRED ACRES, same County, and near to the Pangbourne Station on the Great Western Railway.

Also a very CAPITAL FARM in Kent, of TWO HUNDRED and SIX ACRES, Good Meadow and Arable Land, in excellent condition, good House and Premises. Rent, 130*l.* a-year; tithe free.

Also a very SUPERIOR FARM in Sussex, with excellent House and Buildings, and about FOUR HUNDRED and TEN ACRES of good sound Corn, Root, and Meadow Land. Rent (tithe free) 330*l.*

Also TWO FARMS in Kent, adjoining, to be had together or separate, consisting of TWO HUNDRED and NINETY-SIX, and ONE HUNDRED and THIRTY-NINE ACRES; one nearly all Meadow Land, and the other nearly equally divided; good Premises, &c. Rent and tithes low.

Another CAPITAL FARM in Essex, of ONE HUNDRED and THIRTY-SIX ACRES, Arable, excellent Corn and Turnip Land; good Premises. Rent, 1*l.* per acre; tithe, 5*s.*

Likewise TWO other FARMS, on Lease, near Romford, Essex, 12 miles from London, to be let together or separate, consisting of TWO HUNDRED and SIXTY-FIVE ACRES, 39 Meadow; good Premises, Rent, 510*l.*; tithe, 120*l.*; rates low.

And lastly, several SMALL FARMS, from TWENTY-FIVE to NINETY ACRES, to be let in counties near London.

Rents of each to meet the times. Apply for terms and to treat (inclosing four postage stamps), to Mr. Hurley's Agricultural Agency Office, 62, Nelson-square, Blackfriars-road, London.

TO CAPITALISTS, ELIGIBLE BUILDING SPECULATION.

TO BE SOLD, 33 acres of LAND, contiguous to a rising sea-port and market town in a western county, adjoining a turnpike-road, with extensive frontage upon which 10 houses of respectable character are already built on leases of 60 and 99 years. There is ample space for considerably extending the town in this direction, and the land being at present let as market gardens, renders it not only an excellent opportunity for speculation by retailing it in lots for building purposes, but also a safe investment of capital. The freehold ground rents of the above 10 houses also for sale.—Apply by letter, directed (prepaid) to S. L., Box 100, Post-office, Gloucester. N. B. A Railway passes very near the property.

EXHIBITION, 1851.—AUTHENTIC VIEW OF THE BUILDING, as approved by her Majesty's Commissioners. Numerous unauthorised and incorrect views having appeared, the AUTHENTIC VIEW is this day published, beautifully engraved on steel, nearly 2 feet in length, showing the real size and proportions of the Building, with all its architectural details complete. Price 3*d.*, with description; post free, on roller, 10 stamps.

London: G. Berger, Holywell-street, Strand; and all Booksellers.

PUNCH'S POCKET-BOOK for 1851, will be Published on the 1st of November. With illustrations by John Leech and Richard Doyle. Price 2*s.* 6*d.* in roan tuck.

Punch Office, 85, Fleet-street, and at all Booksellers and Railway Stations.

COMPLETION OF DAVID COPPERFIELD.

On the 31st inst., will be published, price Two Shillings, Nos. 19 and 20 of

DAVID COPPERFIELD THE YOUNGER, OF BLUNDERSTONE ROOKERY. By Charles Dickens. With Illustrations by Hablot K. Browne.

*** The complete volume will be published early in November, price 21*s.* cloth, or 24*s.* 6*d.* half-bound in morocco.

Bradbury & Evans, 11, Bouverie-street.

This day is published, price 2*s.*,

WM. FOSTER, NURSERYMAN, SEEDSMAN, and FLORIST, Stroud, Gloucestershire, has a large stock of good transplanted LARCH of various sizes to offer; prices will be given on application, with samples if required.

N.B. W. F. has a choice selection of Fruit Trees for walls, orchards, &c. Also Seeds, &c.

NOW SENDING OUT.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but often exhibited in our winning collections. The set may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

DOUBLE PANSY "COMPACTUM."

A. DODS has a fine healthy stock of the above beautiful novelty which he is now sending out at 5*s.* each, or seven for 30*s.*—Rose Hill, Brighton, Nov. 2.

RENDLE'S NURSERY, PLYMOUTH, Established 1786.

WILLIAM E. RENDLE AND CO. have this season A LARGE SURPLUS STOCK of many sorts of FOREST TREES and SHRUBS. For prices see the *Gardeners' Chronicle*, October 19, 1850.

Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees, is just published, and can be had for one penny stamp.

Apply to WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

PLANTS FOR BLOOMING IN THE CONSERVATORY IN WINTER OR EARLY SPRING.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge-road, Essex, beg to offer the following, finely set with bloom-buds, at the undermentioned moderate prices:

AZALEA INDICA, in fine sorts	...	18*s.* to 30*s.* per doz.
EPACRIS and ERICAS, ditto	...	18*s.* to 24*s.* ,,
RHODODENDRONS, ditto	...	9*s.* to 18*s.* ,,
KALMIA LATIFOLIA	...	12*s.* to 18*s.* ,,
HARDY AZALEAS, including fine Belgian varieties	...	9*s.* to 18*s.* ,,
MOSS AND PROVENCE ROSES	...	12*s.* ,,
LILACS, GUELDRE ROSES, DEUTZIAS, WEIGELA ROSEA, &c.	...	12*s.* ,,

The above are all beautifully grown, and well established in pots, and are fit for immediate forcing. Remittances respectfully requested from unknown correspondents.

TULIPS, RANUNCULUSES, ANEMONES, IRISES, CARNATIONS, PICOTEES, PINKS, &c.

CAREY TYSO, FLORIST and SEEDSMAN, Wallingford, Berkshire, will forward his CATALOGUE OF FLORISTS' FLOWERS to any address on receipt of two postage stamps; and his Treatise, "The Ranunculus: How to Grow it," on receipt of eight stamps.

Ranunculus Seed, 5*s.* per packet, post free.

HART AND NICKLIN, FLORISTS, Guildford, respectfully offer the undernamed PLANTS, strong and healthy, all of which are well known, and established in character:

GERANIUMS.—Rosalind, Star, Emily, Crusader, Field Marshal, Loveliness, Blanche, Mont Blanc 2, Alonza, Victory, Symmetry, and Belle of the Village. 2*l.* the set.

PANSIES.—Juventa, Premier, Polyphemus, Negro, Conductor, Uttoxeter Hero, Lucy Neal, Pre-eminent, Criterion, Gem, Viceroy, Lucy Ashton, Marchioness of Lothian, Helen, Mrs. Beck, Androcles, Heroine, California, Ariel, and Duchess of Norfolk. 1*l.* the set.

FUCHSIAS.—Striata, Unique, Ignea, Multiples, Mirabilis, Sir J. Falstaff, Don Giovanni, Pearl of England. 10*s.* the set.

Parties wishing for a part and not the whole of a set will be treated liberally. No charge for package, and sent free to any station on the South-western or South-eastern Railways.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.

A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.

Our Foreign Bulbs have arrived in fine condition.

Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW DAHLIAS.

S. HALE wishes to dispose of the Stock of his three SUPERB SEEDLING DAHLIAS, which have been very successfully exhibited during the past season, and are well known to the London growers, each of them having taken First-class Certificates.

SIR CHARLES NAPIER.—Vivid scarlet, shaded with black, fine outline, well up in the centre, superior to any of its class.

JULLIEN.—A rosy lilac, fine outline, well up in the centre, great depth of petals, and a superior flower.

REGINA.—A shaded rose, great depth of petals, fine outline, and fine back tier flower.

The three will be let out to the trade at 5*l.* per root each, for pre-payment only. Early orders can only insure them, as the stock is limited. For further particulars, enquire of Mr. C. TURNER, Royal Nursery, Slough.

Hillingdon, Middlesex.

BEAUTIFUL GLADIOLUSES AND LILIUM LANCIFOLIUM, all strong flowering roots.

GLADIOLUS GANDAVENSIS, a superb dark variety, 6*d.* each, or 5*s* per dozen.

GLADIOLUS RAMOSUS, very pretty, 6*d.* each.

LILIUM LANCIFOLIUM RUBRUM, 2*s.* and 2*s.* 6*d.* each.

,, ,, ALBUM, 2*s.* each, very large roots.

The above, with every other kind of Dutch Bulbs suitable for present planting, may be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London, near the Spread Eagle.

TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES.

C. LODDIGES AND SONS beg most respectfully to inform the above, that in consequence of the land upon which their celebrated Arboretum is planted being required for building purposes, they are determined to offer the STOCK at such a reduction in price (for cash only) as cannot fail to attract the attention of all who are engaged in extensive ornamental planting. The trees are of the finest description, and range from 6 to 10 feet high.

N.B. Packing will be charged as low as possible. Post-office orders made payable either in London or Hackney.

Hackney, Nov. 2.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

TO GARDENERS, RAILWAY CONTRACTORS, FARMERS, AND OTHERS.

FOR SALE, about an Acre of very fine clean three years' old QUICK.—May be viewed upon application to Mr. VINCE, Hounslow Heath, and for further particulars apply to Messrs. KING and SON, Estate Agents, &c., Brentford.

FOR SALE, TWO HANDSOME ORANGE TREES, in Fruit, from 7 to 8 feet high; one the "Malta Blood Orange," the other the "Malta Egg Orange;" also a quantity of choice Geraniums and various other plants.—Apply at 13, Henstridge-place, St. John's-wood, London.

PLANTING SEASON.

WILLIAM URQUHART AND SONS, Dundee, respectfully announce that their PRICED LIST OF SEEDLING AND TRANSPLANTED FOREST TREES, SHRUBS, AND PLANTS, is now ready, and may be had, on application.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had gratis on application.

HYACINTHS in colours, named, for pots or glasses, 6*s.*, 9*s.*, and 12*s.* per dozen; in mixtures, 3*s.* per dozen. MIXED DUTCH CROCUS, 1*s.* 6*d.* per 100. TULIPS for early forcing, 1*s.* per dozen. SNOWDROPS, 2*s.* 6*d.* per 100. NARCISSUS, 4*d.* to 6*d.* each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6*d.* each.

*** Not to be equalled by any now offered to the public.

Address—156, Cheapside, London.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.

CRYPTOMERIA JAPONICA SEEDLINGS.

2 years	18*s.* per doz., or 105*s.* per 100.
3 years	30*s.* ,, 210*s.* ,,
1 foot 6 inches to 2 feet 6 inches high,	60*s.* per dozen.
2 feet 6 inches to 3 feet 6 inches high,	90*s.* ,,
3 feet 6 inches to 4 feet 6 inches high,	126*s.* ,,

And larger plants in proportion.

The whole of the above, with the exception of the one and two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10*s.* 6*d.* to 21*s.*

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS. (North of China.)

6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 21*s.* each.

These plants are from the open border—robust specimens fit for immediate planting.

15 ins. to 24 ins., 31*s.* 6*d.* each; 24 ins. to 30 ins., 42*s.* each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.

15 to 24 inches, 21*s.* each; 2 to 3 feet, 31*s.* 6*d.*

CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet	1*s.* 6*d.* to 2*s.* 0*d.* each.
2 feet to 3 feet	,, 2*s.* 6*d.* ,,
3 feet to 4 feet	3*s.* 6*d.* ,, 5*s.* 0*d.* ,,

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.

Flowering plants ... ... 3*s.* 6*d.* ,,

This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s.* each.

QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Ruga.

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 6 inches ...	... 2*s.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet 6 inches	... 3*s.* 6*d.* to 5*s.* ,,
3 to 4 feet	... 7*s.* 6*d.* to 10*s.* 6*d.* ,,

Larger in proportion.

VIBURNUM PLICATUM. (North of China). A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21*s.* each.

WEIGELA ROSEA.

6 inches high	1*s.* 0*d.* each.
1 foot to 1 foot 6 inches	1*s.* 6*d.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet	3*s.* 6*d.* to 5*s.* 0*d.* ,,

These last are fine bushy flowering plants.

Selections of the finest Autumnal Flowering Roses.

Standards	15*s.* 0*d.* per dozen.
Half Standards	12*s.* 0*d.* ,,

N.B.—We have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which, with Catalogues of all kinds of Nursery Stock, can be sold very cheap, particulars of which can be had on application.

Bagshot Nursery, Nov. 2.

HENRY LITTLE, King's Road, Chelsea, Florist, Nursery and Seedsman to Her Majesty the Queen, begs to offer a splendid Stock of Standard and Dwarf-trained and untrained FRUIT TREES of the best varieties; also a large quantity of Aucubas, Laurels, large green Hollies, Standard and Dwarf Roses, variegated Hollies, Privets, Euonymus, Box, &c., &c., at unusually low prices, the ground being required immediately for building purposes. The finest Hyacinths, with names, 6s. and 9s. per dozen. Crocus, yellow, blue, and white, 2s. per 100; and all other varieties at the lowest prices.

GAINES' SUPERB SEEDLING FANCY GERANIUMS for 1851, which he can recommend as being New, Distinct, and Free Bloomers. GAINES' CREOLE.—Upper petals nearly black, with white edge; lower petals the same; 10s. 6d. GAINES' DIANTHEFLORA.—Upper petals crimson, edged with white; lower do. white, with distinct spot in each; 10s. 6d. GAINES' VENUS.—Pure white, with large dark spot in the upper petals; 10s. 6d. GAINES' GENERAL JUNG.—Crimson edged with white, white centre; 10s. 6d. GAINES' QUEEN OF THE ISLES.—Pure white, with large cherry spot in each of the petals; 15s. The usual discount to the Trade.

N.B. Having a very large stock of Geraniums "Field Marshal" and "Prince of Orange," B. R. C. is induced to offer them to the Trade at 2l. 10s. per dozen.

Carriage paid to London and Norwich and all intermediate stations on the Eastern Counties and Eastern Union Railways.

PLANTING SEASON.—NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., Nurseryman and Contracting Planter.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting, or immediate effect, from 3 to 12 feet, the prices varying from 25s. to 5l. p. 100.

Ash, Beech, Birch, 15s. to 30s. per 1000; Spanish Chestnut, 20s., 30s., and 40s.; Larch Fir, 7s. 6d. to 20s.; Spruce, 20s., 30s., and 40s.; Scotch, 10s., 15s., and 20s.; Pinaster, 10s., 15s., and 20s.; Sea Pine, adapted for exposure to the sea, 15s., 25s., and 40s.; Mahonia, for cover, 40s. to 80s.; Hazel, 15s., 20s., and 35s.; English Oak, 15s., 20s., and 40s.; Poplar, 20s., 30s., and 40s.; Quicks, 5s., 7s. 6d., and 10s.

Planting contracted for to any extent from 5l. to 20l. per acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20s., 40s., and 80s. per 1000; 1 foot, single stems, fit for working, 10s. per 100; 1½ to 2 feet, strong, 20s. to 40s. per 100, fit for planting out at once to cover; 4 to 6 feet, single stems, for working the beautiful scarlet and other fine kinds, 50s. per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18s. per dozen; hybrid scarlet, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25s.; 1 foot, 40s. per 100; Kalmia latifolia, 2 to 4 inches, 8s. to 12s. 6d. per 100; 1 to 2 feet, blooming buds, 50s. per 100; 2 to 3 feet, fine, 75s. per 100; Epigæa repens, 50s. per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8s. per 100; Single Camellias, 25s., 40s., and 50s. per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12s. per dozen; Pinus (Abies) Douglasi, from seed, 6 to 9 inches, 10l. per 100 or 80s. per dozen; Arbutus, 12 inches, 8s. per 100; 1½ foot, 20s. per 100; 2 feet, 30s. per 100; Laurel, 8s. to 20s. per 100; Laurustinus, bedded, 40s. per 1000, 8s. per 100; Variegated Holly, 1 foot, 25s. per 100; Clematis azurea grandiflora, 6s. per dozen, 42s. per 100; Deutzia scabra, 2 feet, 12s. 6d. per 100; Common China Rose, 12s. 6d. per 100; Tree Roses of the most select kinds, 5l. per 100; Dwarf Roses, 50 sorts, named, 50s. per 100; Double White, Double Red, and New Crimson Thorns, 40s. per 100, 6s. per dozen; Large Dutch Honeysuckles, 12s. 6d. per 100; Giant Irish Ivy, 8s. per 100.

The prices are for wholesale, if ordered in less quantities a higher price will be charged. All orders above 5l. carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American steam-packets take their departure, thus saving the delay and expenses of Land Carriage.

A FEW CHOICE LATE PEARS.

GANSEL'S LATE BERGAMOT, raised by Mr. Williams, of Pitmaston, bears well as a standard. Season, December. Young trees on the Pear stock 5s. each; double worked on the Quince, 7s. 6d.

WINTER BEURRE (Rivers's).—A new seedling from the Easter Beurré, quite hardy. Season, February and March. On Pear stocks, 5s.; double worked on the Quince, 7s. 6d.

BERGAMOTTE D'ESPERIN.—Season, April and May. On Pear stocks, 2s. 6d.; on Quince, fine pyramids, 3s. 6d.

BEURRE BRETONNEAU.—Season, May and June. On Pear stocks, 5s.; on Quince, 5s.

DOYENNE GOUBAULT.—Season, March. On Pear stocks, 2s. 6d.; on Quince, fine pyramids, 3s. 6d.

SUSETTE DE BAVAY.—Season, March to May. On Pear stocks, 2s. 6d.; on Quince, fine pyramids, 3s. 6d.

JOSEPHINE DE MALINES.—Season, February to May. On Pear stocks, 2s. 6d.; on Quince, fine pyramids, 3s. 6d.

All the above are first-rate melting Pears, and bear well as pyramids.

CANES of the LARGE FRUITED MONTHLY RASPBERRY, now in full bearing, are this season sold at 4s. per dozen; 30s. per hundred.

Thomas Rivers, Nurseries, Sawbridgeworth, Herts.

HERTFORD ROSE NURSERIES.

E. P. FRANCIS'S NEW ROSE CATALOGUE, containing all the newest kinds introduced and worth cultivating, is now ready for delivery, and will be forwarded gratis on application. The Collection this year is very extensive and remarkably fine.

MYATT'S LINNÆUS RHUBARB, strong roots, 12s. per dozen; Myatt's Victoria, 9s. per dozen; and Mitchell's Royal Albert, 12s. per dozen. Extra strong plants of the New Red Currant "Raby Castle," 6s. per dozen, or 45s. per 100; and Fastolff Raspberry, 10s. per 100. With the usual allowance to the Trade. Post-office orders are requested to be made payable to Joseph Myatt, Manor Farm, Deptford, near London.—Nov. 2.

CHOICE FLOWER ROOTS, CHEAP.

Carriage free, as see below.

The finest fresh imported HYACINTHS, ANEMONES, CROCUSES, &c., may be had at much less than the usual prices, as under.

The above 24 Gooseberries (taken from the "Gooseberry Register," 1850) are the heaviest grown in England during the last season.

John Holland, Bradshaw Gardens, Middleton, near Manchester, respectfully informs his friends, that he can supply the above 24 strong plants for 12s.; 12 plants for 7s., package, &c., included. Post-office orders to be made payable at Manchester.

Auriculas, Alpines, Polyanthus, Primroses, Carnations, Picotees, Pinks, Pansies, &c. Catalogues on application.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

TESTIMONIAL TO MR. MUNRO, late Gardener to the Horticultural Society of London.—At a Preliminary Meeting, held at the Roebuck Inn, Turnham Green, September 30th, 1850; Mr. Glendinning, Mr. Thompson, Mr. Cock, Mr. Edmonds, Mr. Gordon, Mr. Caie, Mr. Ayres, and Mr. Ivison being present, Mr. Glendinning was called to preside. Mr. Caie was then elected Secretary, and Mr. Edmonds Treasurer.

It was then Resolved, That a subscription not exceeding Half-a-crown for each person should be entered into for the purpose of presenting Mr. Munro with a suitable Testimonial of esteem, on his retiring from the superintendence of the Horticultural Society's Garden, which appointment he held for upwards of Thirty years.

Persons desirous of contributing are requested to forward their subscriptions to the Treasurer, Mr. Charles Edmonds, Chiswick House, Chiswick, Middlesex.

It was also Resolved, That the Subscription List be closed on Saturday, November 16th, 1850.

*** Post office orders payable at Turnham Green.

JOSEPH TREMBLE, Nurseryman, Seedsman, and Contracting Planter, Penrith, Cumberland, begs to offer BERBERRY AQUIFOLIA, transplanted plants, very fine and stout, 3s. 6d. to 10s. per 100. Berberry Dulcis, 3 years old, 1 year transplanted, very fine and stout plants, 5s. per 100. The above fine dwarf flowering Evergreens are suitable for planting Avenues, Carriage drives, Cover for Game, &c. Special offer in large quantities. Carriage paid to any railway station. Berberry Aquifolia, finest plants, 80s. per 1000. Berberry Dulcis, 40s. per 1000.—J. Tremble offers a general stock on the most reasonable terms.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, James Phillips and Co., 116, Bishopsgate-street, Without.

Dixon v. *Bessell.—Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant 60l., and 10l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. Magnus's Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. Magnus, 39 and 40, Upper Belgrave-place, London.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS and CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to James Hetley and Co., 35, Soho-square, London.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

J. AND J. FAIRBAIRN having an immense Stock of remarkably fine FRUIT TREES, trained and untrained, consisting of Peaches, Nectarines, Apricots, Pears, Plums and Cherries, in a large assortment of the most approved kinds; also a very large stock of ornamental Forest Trees, Flowering Shrubs, and Evergreens, on land they are anxious to clear, are induced respectfully to solicit the attention of Gentlemen planting to an inspection of the same, which they intend to offer at such prices for cash as they hope will insure their liberal orders.

J. and J. F. also beg leave to solicit the attention of Gentlemen wishing to furnish Greenhouses, Conservatories, &c., to their stock of Cape Heaths, Epacrises, Chinese Azaleas, Boronias, &c., which is unusually large and fine this season, to which they will affix the most moderate prices, to induce the favour of extensive orders.

Nurseries, Clapham, near London, Nov. 2.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

THE PLANTING SEASON being near at hand, WM. WOOD and SON respectfully inform their friends that their stock of ROSES is this season more extensive than ever. In addition to the above, the Nursery abounds in every description of SEEDLING AND TRANSPLANTED FOREST TREES; also American, Evergreen, and Flowering Shrubs, Ornamental and Fruit Trees, &c., &c., well worthy the attention of gentlemen planting.

Catalogues will be sent free on application.

EDWARD DENYER is now prepared to send out his new Descriptive CATALOGUE of Roses, Fruit Trees, Evergreens, Shrubs, Ornamental Trees, &c., which will be forwarded, by enclosing two penny stamps to his Nursery, Loughborough-road, Brixton. E. DENYER informs his friends that he has no Seed-shop in London.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 2, 1850.

MEETING FOR THE ENSUING WEEK.

TUESDAY, November 5—Horticultural .....2 P.M.

THE art of striking plants from CUTTINGS is one which mainly depends for success upon preserving the vital fluids from evaporation, until the germ or bud from which a new plant is to spring can become sufficiently organised to maintain an independent life, separate from the branch that bore it. For this reason, we find universally in practice, the employment of hand-glasses, or bell-glasses, the effect of which is to retain, in a state of uniform moisture, the air which surrounds the cuttings; because evaporation cannot go on to an injurious extent, in an atmosphere itself charged with vapour.

Every one who has attempted to propagate plants by cuttings, has, however, found certain practical difficulties in his way. He would easily succeed with Pelargoniums, and Fuchsias, and China Roses; but when he attempted to deal with Apples or Pears in the same manner, he will probably have failed. Among the methods invented from time to time to overcome such difficulties, and to which we need not refer on the present occasion, is one by Prof. DELACROIX, of Besançon, which appears to deserve attention, both for its novelty and ingenuity.

This gentleman states that he, some years since, conceived the idea of insuring the success of cuttings, by putting the lower end in water, and the middle in earth, a circular incision being made between the earth and water. This was not attended with all the advantages he expected, but it led to the discovery of the following plan, which he designates a simple, œconomical, and certain mode of propagation. His process is described in the following words.

"My cutting is placed entirely under-ground, so as to form a subterranean curve, of which the convexity is uppermost, the very middle of the curve being on a level with the surface of the soil. At this middle point there must be a good eye, or a small shoot. In this way the whole length of the cutting is protected by earth, and the smaller end, instead of becoming the seat of dryness, which is always more or less injurious, becomes a passage for absorption. The bud, which, under these circumstances, is the only part exposed to the air, bears, without injury, or rather with advantage, all the causes of excitement.

"Although I did not commence my experiments before the end of June, I have seen quite enough to satisfy me that the method may be of serious advantage.

"Two drills about 3 inches apart were drawn parallel with each other, in a kitchen garden of indifferent quality, situated on a calcareous plain near Besançon. A hundred cuttings of Apples, Pears, Plums, Apricots, Tulip-trees, Roses, &c., almost all of this year's wood, were bent and buried in the manner described, with their ends in the two drills. They were watered a few times, and at this moment every cutting, in the open air, and exposed to the full sunshine, is just as fresh as it was when planted. In most of them, the part exposed to the air (the bud) is the seat of active vegetation, especially in the Pears and Tulip-trees, the buds of which have already made some progress."

This idea seems to be a very good one, and its adoption can hardly fail to increase the chances of successful propagation.

ALL the world, at least all that part of the gardening world which inhabits Great Britain, has heard of a surprising Vine at Hampton Court. Everybody goes to see it at least once in his life; it is a separate and special object in the grounds of the old palace, kept under lock and key, as it well may be, unless its fruit is abandoned to the refreshment of her MAJESTY'S loyal subjects. To account for the immense crops of Grapes borne by this Vine, and for its vigorous old age, it has been stated that its roots are in an ancient sewer, where they find abundance of the rich materials, out of which the Vine prepares sugar and acid, and colour and fragrance, and all that gives deliciousness to its fruit. In 1837 it was reported to have borne 800 lbs. of fruit, upon a roof consisting of 2304 square feet.

It is a mistake however to regard this famous Vine as the most remarkable specimen of the kind in Great Britain. Within a few miles of it may be found one yet more striking. In the royal garden of what once was Cumberland Lodge, near Windsor, there stands a solitary Vinery, sole relic of departed greatness, concerning which we have the following account from an experienced Grape grower who lately visited it.

"We have been astonished, much more than instructed, by the numerous systems which have of late years appeared for Grape growing; when we thought that we had found a roc's egg, something suddenly appeared to dim our vision. The object fled, our faith vanished, and we found ourselves again where we were. One successful cultivator recommended the borders to be concreted beneath, and asphalted above; the first to prevent the roots getting downwards, and the second to carry off the rains. An unsuccessful writer condemned the one as unnatural, and the other as unnecessary; the first, because the drainage would be incomplete, and the second, as obstructing the action of the sun on the border. Another gentleman insisted upon robbing the dog kennel, and feeding Vines upon horseflesh, animal manure being more potent than vegetable. Nevertheless, to our astonishment, an experienced cultivator plants his Vines in his roadway, formed of clinkers, brickbats, and similar rubbish, and ripens most satisfactorily two crops of Grapes in a season. Another gentleman, who set himself up as a great authority, insisted—in fact, wrote a book about it—that good Grapes could only be grown by having their roots cemented in a brick pillar. Mystery after mystery presents itself, and not the least appears when we stumble upon the great Vine at Cumberland Lodge. This monster, loaded with 2000 large bunches of Grapes, as black as Damsons, must surely have had some leviathan 'practical' to cook his border. Let us read its history. Some 50 years ago it was found in a small Cucumber pit. The plant seemed to like its situation, for it soon outgrew this limited abode. It became necessary to extend the shelter; and this has been twice done, until the pit, for it can hardly be called a house, is 138 feet long, and 16 feet wide. Incredible as it may appear, the stem of this Vine measures 2 feet 9 inches in circumference; and when we saw it about a month ago, this immense crop was ripe, the bunches were large, so were the berries; besides, they were black, not brown, and the foliage as vigorous and green as in June. The entire aspect of this house presented a perfect and most instructive whole. There were no brown bunches here and black ones there—no missing at one end of the rafter, and clustering and huddling at the other. It would, in fact, have defied mechanical skill to have distributed the bunches with greater regularity. The size of the bunches, likewise, was nearly uniform—not a shaggy one here and a monster there; for, as we find Stilton cheeses, so these were nearly of one weight and make.

"Now we come to the great problem which is to resolve all this wonderful development—the border; and, by Mr. INGRAM'S kindness, we were permitted to dig several holes, to ascertain its composition, its mechanical construction, and to ponder upon the wisdom and foresight of some great royal gardener. We did for a moment entertain the idea that one of the craft, adorned with a blue apron, bearing mysterious wisdom in his countenance, and practice in his whole deportment, must have been concerned in an undertaking which has produced such marvellous results. We entered upon our task, then, under the impression of revealing to the world a grand secret, and so we shall.——Without difficulty or serious obstruction we readily got through 2 feet of common garden soil; neither encountering a brickbat nor a clinker, a horse's leg nor a bullock's head. There was no evidence of compound manures or simple quackery; the ground was as natural as if it had remained untouched since the Deluge; for immediately beneath this 2 feet of ordinary soil we came upon blue clay!—with a portion of sand intermixed with it. Such clay, indeed, as we should be glad to run against, were we about to form a pond and in want of puddle!!"

It is 12 years since we saw this plant, but it then promised to become all that it is now described to be; the circumstances under which it grew are fresh in our recollection, and entirely confirm our correspondent's description; a mass of the gravel and clay over which it grows is before us, and is too hard to be broken by the hands; a sample of its beautiful fruit was exhibited at the last meeting of the Horticultural Society in Regent-street, and wholly answered to the character just given of it.

Here, then, a Vine, whose roots are not in a sewer or any such place, but in ordinary garden ground, resting on a coarse hard gravelly clay, covers about the same space as its celebrated rival, and bears twice as many Grapes, of the highest excellence. Surely we have in this a striking example of the folly of spending large sums in preparing vast borders out of costly materials, of which the Vine has no real need. No doubt the Vine border at Cumberland Lodge was prepared originally from good materials, such as our predecessors thought suitable to its nature; and that amount of preparation was necessary, in order to enable it to establish itself securely in the earth. But for this a small quantity of materials was sufficient; and, once established in soil that it likes, the Vine needs little further care. Its chief desire is to have a WARM, LIGHT, DRY, SHALLOW border, and that is precisely what it gets at Cumberland Lodge.

VILLAGE EXCURSIONS, &c.—LETTER IV.

MY last letter has pretty well exhausted what I have to advise concerning village excursions, and I shall now conclude with a few words of caution to those who may be inclined to promote them. We cannot expect, in country places, that any innovation will be universally approved. Previous to proof positive, *à priori* conclusions are very commonly self-discouraging to many of our village reasoners. Even conviction is slow in manifesting itself after undeniable evidence has been produced, and in some cases it cannot be persuaded to manifest itself at all. Certain natures, kindly disposed in some respects, seem strongly predetermined to regard the agricultural labourer as a being who ought to be retained in a condition as little dissimilar from that of a serviceable automaton as can be contrived for him. All schemes, educational, recreational, or however tending to elevate him in the social scale, are positively distasteful to some of the employers of labour, whom, nevertheless, we are bound to recognise as worthy men, not wilfully opposed to the comforts of those beneath them. Honest blind prejudice will be found to form one class of impediment to carrying out village excursions so freely and fully as we might desire to see them. Some, again, with less excusable unreasonableness, will be found objecting to join in these excursions because they are not sufficiently select, and would rather have them organised as if we were proceeding to the Canterbury settlement. But the plan which I have suggested does not admit of any one being lightly excluded who has been selected by those who may be nominated to form the nucleus of the party. No doubt there will often be some one or other whom we had rather leave behind; but if sufficient guarantee is given that he will not be suffered to make himself offensive, it is far better that he should be allowed to join, even at the risk of losing some half-dozen patrons and patronesses, who can at any time indulge themselves without the dreaded disgrace of being found in the same train or in the same boat with those whose presence they consider so objectionable. But, after all, these little stumbling-blocks to unanimity need not vex us. It would be found impossible to please every body, even if popularity were our aim in these adventures. There are certain possible inconveniences of more serious consequence than either the frowns or the sneers of dissatisfied objectors; and against these it will be necessary to take proper precautions, unless we happen to possess a larger share of equanimity (not to say apathy), than some of us may care to enjoy. It may rain heavily all day; now, although country folks care less for rain than even soldiers on parade, yet if our arrangements have only been made for squaring with the supposition that it must inevitably prove fine,

such embarrassment may follow as will cause the excursion to prove a failure.

In a town there are the more obvious expedients of museums and manufactories to be visited, under shelter; and short addresses or half lectures may assist in filling up the time. When these resources fail (or even when they do not), there will generally be some one or other able to sing, whether sentimentally or facetiously need not signify. A little dancing, if occasion require, may be suggested; and as for music, I most heartily advise all who take an interest in the social enjoyment of our villagers to agitate their respective unions for the establishment of a workhouse band. The master of our Cosford union was, I believe, the first to organise a band of about a dozen of the orphan boys residing in the house; and the plan has now extended to a few other establishments. Their music is far beyond what might have been expected; and it has given quite a different tone of feeling to the place. It is also a very useful accessory at village *fêtes* and festivities, cricket-matches, and school-children assemblages. This band has accompanied us in our excursions; and we have also been favoured with the company of a "man that could not get warm," whose shakings and lamentations excited the risible muscles of some who know how to be serious in due seasons. Should neither music or dancing avail sufficiently to while away a rainy day, perhaps leap-frog or something else that will suggest itself at the moment, to those who are well disposed towards seeing country people happy in their own way.

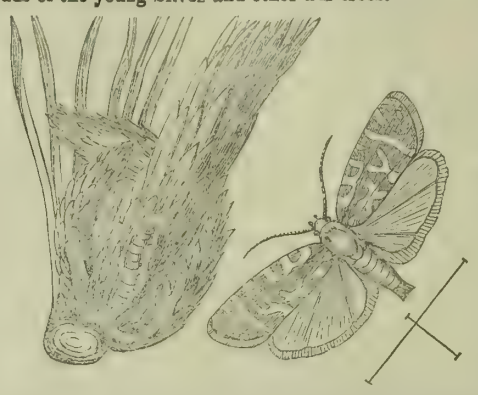
Although I am aware these proceedings have been considered, by *à priori* objectionists, likely to "unsettle the labourer," my own experience has proved to me that we all get up the morning after our excursions already shaken into our respective positions and occupations, as completely as if we had been only dreaming of the previous day's adventures. We may possibly greet each other with an additional smile, and a somewhat kindlier feeling than when we met two days before. My testimony will weigh little with a farmer, in comparison with that furnished him by a brother farmer. Now one such (I might say more than one), has assured me that his men have worked most cheerfully, and to the full as steadily, after our excursions as ever they did before. They have afforded subject for conversation for many a day, and so far from engendering anything like a feeling of discontent, the effect has been the reverse.

If you require me to continue these letters, you must append an &c., to their present superscription. I consider the matter referred to in the article and pamphlet you have sent me, of very deep interest to our agricultural population. I will think the matter over, and though I hardly consider myself to possess sufficient experience on directly educational schemes to make my testimony of much value, I will freely give you my opinion, and you must decide for yourself whether you think it fit for the pages of the *Gardeners' Chronicle*. *J. S. Henslow.* [We sincerely trust that our excellent correspondent will favour us with many more communications on such a subject as he has selected.]

ENTOMOLOGY.

The Pine-bud Tortrix.

The various species of the genus Pinus are too important in an economic point of view, independent of the interest which attaches to them from their great use as ornamental trees, not to render the economy of the different insects which attack them worthy of attention, with a view to preventing or diminishing the mischief which they produce, and unfortunately the number of different insects which feed upon this tribe of trees is very considerable, several of which are already described in our pages. In our volume for 1845, p. 456, was described the Hylobius abietis, which gnaws the young shoots, stripping the stems of their bark. In 1846, p. 740, the Hylurgus piniperda was described, which burrows into the main shoots of various Conifers, especially preferring the Scotch Fir; and in 1844, pp. 796 and 831, are described some curious minute aphis-like insects, which derive their nourishment by sucking the juices of the young shoots of the Spruce Fir.



At the end of the month of May last we observed various species of Pinus, growing in the ornamental grounds of the Horticultural Society at Chiswick, to be attacked by the larvæ of a small lepidopterous insect. This insect, which is the Tortrix (Orthotænia) Turionana, ordinarily attacks the Scotch Pine (Pinus sylvestris), and the black Austrian Pine (Pinus nigricans); but we observed it upon Pinus insignis, ponderosa, and Llaveana, the first named of which was especially more subjected to its ravages.

The larvæ are hatched from the eggs deposited by the females in July, in the course of 10 or 12 days, when they immediately penetrate into the bud, the centre of which they destroy, and descending through the heart of the bud to its base they then attack the adjoining buds; in the same manner not only destroying the central shoot, and thus preventing the straight and elegant growth of the branches, but also killing the side buds, and even penetrating into the turpentine tubercles with which some of these Firs abound. By the end of October the caterpillar is feasting on the interior of the largest middle bud, beginning below that which was formed for the following year, in which it spends the winter, renewing its ravages in the spring.

The larva is of a dark, glossy, purplish-brown colour, with the head, and a transverse patch on the first segment following the head, black; it has three pairs of articulated legs attached in pairs to the first three segments of the body, the fourth and fifth segments are legless, each of the four following segments has a pair of fleshy prolegs, and there is another pair of the same kind of legs attached to the terminal segment of the body.

The caterpillar is full grown about the end of June, when it descends to the lower part of the burrow which it has formed in the bud, and is there transformed into a shining chestnut-brown chrysalis, which, like those of most internal-feeding species, has the head furnished with a small point between the eyes, and the segments of the abdomen armed with double rows of very fine points directed backwards, enabling the insect to move itself about in its retreat.

The perfect insect makes its appearance at the middle of July, and is one of our most beautiful species of Tortricidæ. It is likewise far from common in our collections, owing probably to the few Fir plantations of any extent accessible to collectors. It is the Phalæna (Tinea) Turionana of Linnæus, and the Orthotænia Turionana of Curtis and Stephens, and it varies in the expanse of its fore wings from half-an-inch to 11 lines; the fore wings are of a bright, fulvous orange colour, with about four irregular transverse anastomosing silvery streaks, and a simple one on the hinder margin, some of them bifid on the costa, which has one or two small silvery dots; the extreme hind margin is also silvery, with a very slender blackish line at the base of the fringes, which are pale; the hind wings are dusky leaden coloured. When at rest it sits with its wings closed on the trunks of the Fir trees. The female shortly afterwards lays her eggs on the points of the buds of the young Silver and other Fir trees.

Although the attacks of this insect on the different species of Pinus is rarely of sufficient extent to effect the destruction of the trees, yet they are injured in their growth, particularly when the heart bud of the leading shoot, which forms the continuation of the stem, is destroyed; and when, consequently, the straight growth of the tree is prevented. Kollar suggests that nothing more can be done towards the destruction of this insect than destroying the turpentine tumours, particularly about the end of October, while the caterpillars are in them, or cutting off and burning every shoot infected with them. The latter method may be avoided, and the shoot saved, if the resinous tubercle is destroyed before the caterpillar penetrates through it into the alburnum of the tree. If this be delayed until the summer, nothing is easier than the destruction of the insect in the pupa state, at the end of June, since the buds which contain the insects are at once perceived by their drooping and dying state; on breaking these off, the brown active chrysalis is seen at the bottom of the injured part, and children may be easily trained to cleanse such trees as are grown as ornamental shrubs. If this be attended to, and the chrysalids destroyed, the injury from a next year's brood of caterpillars will, of course, be prevented.

The figures represent the perfect moth magnified, the cross lines indicating the natural size, together with a twig of the Fir, consisting of three buds, all of which are destroyed by the boring of the caterpillar seen within the central one. *J. O. W.*

VILLA AND SUBURBAN GARDENING.

The beauty and interest which a garden affords depend greatly upon the disposition of its individual parts, even the arranging and planting of a single bed require experienced taste, in order to produce effective display. Take, for example, a Rose bed; imagine the kinds to be indiscriminately mixed, and no attention to have been paid to their respective heights, and the effect produced by such a medley assemblage will be immediately felt by any person possessing taste, and accustomed to observation. Let us further suppose such a bed to be circular, and the effect will be as bad as it well could be, unless the object aimed at was to represent wild nature. The taller plants should have been placed in the centre, and the others arranged so as gradually to fall to the outer rim. This arrangement would advance us a step; but let us proceed further, and dispose of the trees in zones or circles. In this way we give the bed the expression of design. For be it clearly understood that we are discussing gardening in an artificial sense. Now let us go a little further still, and consider whether there be not yet room for improvement; suppose we plant one colour in the centre circle, and so change each circle until we reach the outer one. By such a classification we add colour as well as design; but imagine the colours to be so arranged that another important feature is produced, viz., contrast, and the picture becomes still further improved, though not yet finished. Would not an edging render the whole more complete? The beauty and brilliancy of the Rose would be singularly improved, and relieved by an evergreen margin. This would in some measure help as it were to lift the group from the earth, and place it nearer the eye. This edging may be of Ivy or Cotoneaster microphylla or Pernettya mucronata, or in fact any low dwarf evergreen shrub kept shorn into a formal rim.

In the above I have shown how much beauty may be exhibited even in a circular bed, by the exercise of a little taste and forethought; but these simple principles are by no means confined to a Rose bed; they can be carried out in every matter relating to the arrangement of a garden, so that unity and comprehensiveness of design may characterise the whole. When a contrary state of things prevail, delight vanishes, confusion takes the place of order, disgust that of pleasure; and instead of the most charming of all pursuits, contributing to relieve the man of business from the oppressions and satieties of mind usually resulting from close application, he abandons the whole in utter dismay and hopelessness. *Pharo.*

BRITISH SONG BIRDS.

No. III.—Mechanical Aviaries.—There have been, from time to time, a number of experiments made by the curious, to see if birds would live in mechanical aviaries; many and various are, and have been, the cruelties practised in consequence. By mechanical aviaries, I mean an extensive space fitted up with fanciful *papier maché* ornaments, and erections of painted wood, in the form of artificial houses, cottages, &c.; with trees, wind-mills, water-mills, fountains of real water, flowing brooks, rivulets, and other similar adjuncts; the *ensemble* intended to convey to the beholder the idea of a rural landscape.

The arrangement and disposal of these objects has, to the eye, a very pictorial effect; and when the sails of the wind-mill are at work, and the water is seen flowing from the mill above, meandering in its progress through the valleys beneath, the effects are curious, the illusion is complete. When, however, "song birds" are introduced into the back-ground, to assist the artist in animating his landscape, and expected to be "happy" in a "Deserted Village" like this, where there is nothing to be found at all assimilating with their natural habits, the whole affair becomes farcical in the extreme, realising the old adage most felicitously—that "there is but one step from the sublime to the ridiculous." As well might the mighty King of Brobdignag have laid himself down on a bed at Lilliput, stretched himself out at full length, and expected to have slept soundly without being comfortably tucked up. Strangely indeed must things be out of tune, when a carpenter usurps the place of a winged chorister, and plays "first fiddle" in an aviary!

These mechanical aviaries are, for the most part, attached to the rear of a room on the ground floor of a house or mansion; and are viewed by throwing up a window, which, when raised, discloses the whole mimic scene. The space allotted to the unhappy feathered tribe doomed to inhabit these miniature villages, when beyond the limit of the spectator's observation, is cruelly small, and altogether ill-adapted for their comfort; nor can their existence under such circumstances be of long duration. The whole disposition of the place and its objects is unnatural—Nature being entirely sacrificed for (so called) effect. If such conceits as these must be perpetrated, be it so; but, then, spare no expense in making the "acting" inhabitants comfortable and happy "behind the scenes," as well as "before the curtain." *Verbum sat.*

A very large picturesque aviary, precisely similar to the one I have been describing, was, some years since, to be seen, by favour, in the neighbourhood of one of our fashionable squares at the west. It was erected by an aged, wealthy gentleman, since deceased. Fame, with her trumpet tongue, had brought my aviary under his notice; and enquiring the whereabouts of my house of business in town, he paid me a complimentary visit.

Some days subsequently, my new acquaintance called, by appointment, with an ample carriage-load of gay folk at my rural villa—to view what they termed "the Exhibition." While walking through the rooms, the old gentleman and his retinue expressed, and I firmly believe experienced, the utmost astonishment and bewilderment at what they saw; and seemed amazed at the cleanliness and method observable throughout the building.

Of course I talked to them, as is my wont when speaking about my pets, in a frank and most expressive manner, detailing the little endearments of my feathered family, and dwelling impressively on their attachments, recognitions, friendships, tricks, and little manœuvres to win my favour; not failing to catalogue also their faults, jealousies, and tempers, &c.; dwelling on these latter, however, as lightly as might be.

All this was *de trop*, evidently quite beyond the comprehension of my visitors. The ladies in particular—with one memorable exception*—seemed to regard me

* On this particular occasion was beautifully illustrated the remark of one of our good old writers—"As by the friction of two pieces of ice heat may be extracted, so in the coldest bosom may dwell a warmth that only waits for some favourable circumstance to bring it into action." I could but lament, to think how soon the bright spark kindled might be extinguished by "strange fire!"

as a remarkable phenomenon; indeed, I confess I felt myself such, while in their company. The lady I have just adverted to deserves, however, honourable mention. She evidently possessed a "soul," for she listened attentively, patiently, I may add affectionately, to my little story throughout; becoming every moment more and more interested. Between myself and my readers, I could have found it in my very heart to have given this fair specimen of humanity one of my choicest birds, had it been *comme il faut* on so short an acquaintance. But as it was not, I merely gave her an expressive look, signifying I would if I dared. My look was understood; my wish thoroughly comprehended. A sweet smile ratified the fact. Let me add, I have never seen her since.

"Is it possible," mused I, after my visitors had departed, "that such people as these can be fond of birds? Or can they indeed be said to possess any of the finer feelings of our nature? If so, 'tis passing strange." But now for my return-visit to the west-end aviary.

I paid my visit late in the autumn. Sir John Shoulder-knot, in the absence of the family, ushered me into an elegantly-furnished chamber; and on presenting my card of entrée, the window was thrown up, disclosing a very pretty romantic village, constructed just in the manner already detailed. My remarks on what I saw, shall be brief.

Observing only one or two very miserable looking birds in the foreground of the picture, I anxiously turned round to enquire the cause. Sir John informed me, that since the inclement weather had set in, most of the birds, having no fire or artificial warmth near their habitation, had perished from the cold. He added, "I do not think, Sir, the few which are left will live long." Nor did I. The hand of death was visibly about to close their eyes for ever!

I hesitated not to speak my mind fully upon the cruelty of this neglect; and intimated to the man in plush, a desire to have my remarks faithfully reported. The rejoinder was short and pithy: "Master says, Sir, if they die, they die; if they live, they live."

Not long after this, I heard that the whole had perished, and that the wealthy owner of the romantic village had been recently seen in the classic neighbourhood of the Seven Dials (preparatory, doubtless, to a refit), bargaining for a robin, a chaffinch, and a hedge-sparrow, whose fate, alas! might too surely be foretold.

I have introduced this episode, in connection with the general subject, in the hope that, when it meets the eye of other similar bird-fanciers—very many such I fear there are—it may carry conviction with it. Every man and every woman, no doubt, do "think" at some period of their lives. I have, therefore, merely supplied the "materials" for their meditation. *Qui capit ille facit. William Kidd, New-road, Hammersmith.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND; OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

No. II.—How best to fasten fruit trees to a wall; an offshoot of the subject.

A bosom friend saved from becoming a public spectacle in its old age.

With regard to the fastening of Vines I with a great respect for scarlet waistcoats, and with a hope of sparing the pang of nailing them to walls, to serve as princely homes for Grape-consuming insects, would recommend a plan, though perhaps more laborious and expensive at first, will certainly save labour and money in the end.

Let the industrious and improving read and do it, the idle and old ways may pass on. Strain painted wire (No. 13), over the wall, at about ¼ of an inch from it, and 1 foot from each other by means of stay-nails; (that is, flat pieces of iron about 3 inches long, and ½ of an inch broad, sharpened at one end, and having a hole drilled through at the other); one of these should be used every 2 feet in distance, the wire passing through the hole, and being fastened at either end. The wire can be strained either in an upright position, or lengthways, as most convenient. The Vine rods can be fastened to these by bass; the smaller branches by twigs stretched across. Another, perhaps, cheaper plan is to drive sufficiently large headed nails, or stay-nails (with holes sufficiently large to allow the fastening used to pass through) into the wall, at the required distances.

No harbour, no rats; no rats, no cats.

Under the waistcoat system, I should have here recommended frequent lime-washing, to keep the wall free from insects, but this, I think, will now be found unnecessary.

How to supply the want of heat to the roots of Vines.

In the next place, we have to reflect how we can supply the heat that is required to the parts of the Vine under the ground (viz., the roots) and though it be of equal importance, it is not usually enough attended to. To effect this we must force the roots as near the surface as possible. We must also insure good drainage; for the temperature of the soil will vary as the moisture. Remove the water, and air, heated by the sun, will take its place. We shall find these two points fully established as necessary, if we apply to, as our test, the nature of those circumstances under which the Vine most flourishes. Thus, we before stated, that it loves to grow on the steep sides of mountains; and, indeed, in many rocky districts, the cultivators are in the habit of carrying up soil in baskets in which to plant the young Vine; so that it cannot strike deep on account of the underlying rock; and the drainage is very rapid. No season, I am convinced, will be found in which there is not a sufficient amount of solar heat to ripen Grapes, if we could overcome the bad effect of the cold winds and rain. *C. A.*

As folly goes out, wisdom comes in.

THE WINDOW GARDENS OF LONDON.

EITHER amateur gardeners are become more skilful, the London atmosphere much clearer, or the speculations of byegone days were fallacious, for during a recent stroll from Belgravia to Temple-bar the appearance of the numerous balcony gardens (and they are become quite a feature in the street scenery of the great metropolis) was directly opposite to what one would infer if he had lived in the country all his life, and formed his opinions from what he had read of the soot-loaded air of London. The plants for the greater part were in luxuriant health. Scarlet Geraniums with leaves of a tint that would not have disgraced the window-sill of a villa at Hampstead; and mingled with them were trusses of flowers in every way beautiful; and I could not admire them without mentally ruminating upon the amount of gratification which their owners must derive from the possession of such objects in localities where there is so little to remind one of the green fields and flowery banks, of sunny skies and summer rambles.

Foremost as a window plant in the closer streets is the trailing Lysimachia nummularia (Money-wort) of our English meadows, and a very pretty and graceful adjunct to a London, or indeed any balcony, it certainly is. In Essex-street, leading from the Strand, is a window garden of more than ordinary magnitude. Lysimachias, Geraniums, Chrysanthemums, and numerous other plants, were rambling with a luxuriance quite incompatible with the ordinary ideas of a floral display in London. And in almost every street, however apparently unsuited for gardening operations, windows full of healthy plants are sure to gratify the eye of the pedestrian.

There is one circumstance upon which I must beg to become critical. I know I touch upon a delicate point, yet I feel assured that those numerous window gardeners who read the *Gardeners' Chronicle* will take the little bit of criticism in the same spirit as it is given. I allude to the red pots, which offend the eye at every turn, and materially detract from the otherwise pleasurable sensations conveyed by the healthy plants occupying them. Not satisfied with the self colour of the pots (in itself quite bad enough) their possessors anoint them with some pigment of a fiery red colour, quite distressing to look at. I am somewhat puzzled to account for a seeming anomaly in this respect, which I observed at a mansion, I think, in Belgrave-square. At the first floor windows were some plants rejoicing in all the pride of newly coloured red pots, and in that immediately above them some neatly executed vases, in imitation of stone, were the receptacles of some plants in every way similar to those in scarlet livery. The contrast was so marked that I could not but pause to admire the one, and to notice how exceedingly the other suffered by the comparison. *George Lovell.*

TRADE MEMORANDA.

MR. WILLIAM BENDALL, of Stockbridge, has just favoured Mr. Small, Nurseryman, Colnbrook, with an extensive order. Was there not a person with some such name lately in Winchester jail?

Home Correspondence.

Plums.—I have long been a cultivator of fruits, and have seen them in many sites and soils, in every part of England, and in many on the Continent, and I now feel more than ever the extreme caution required in publishing an opinion of the merits or demerits of any particular variety. Such were my reflections on reading the article at p. 678, headed "Select Plums." Your correspondent, "J. B. W.," received fruit of the Reine Claude de Bavay on the 10th inst., after a journey from France: and proceeds to give his opinion of it. Now this is at least more than a fortnight after its perfect maturity here; for in England, South of Trent, it ripens as nearly as possible, allowing for the variation of our seasons, from the middle to the end of September; and when fully ripe and slightly shrivelled at the stalk, it is brimfull of a rich, sugary, refreshing juice. In my opinion it is more grateful to the palate than the Green-gage, which, when fully ripe, fatigues the taste with its lusciousness. I ate some fruit of the Reine Claude de Bavay from my tree, I think about the 15th inst.; they had lost their juice, and were not good. The Queen Mother Plum, as you well know, is a small Plum, good enough, but not worthy of much notice. Kirk's Plum is really good. The Precoce de Tours, one of our least hardy Plums, I have some pleasant recollections of; three very large standard trees, planted by my great grandfather, used in my boyhood to bear once in four or five years a tolerably good crop, worth gathering to send to market; in other seasons only a very thin sprinkling. In these seasons of scarcity we, the boys, had the privilege of shaking the trees and appropriating the Plums to ourselves. What "jolly" seasons they were, and how often they came! This Plum is indeed only fit for a wall. The Early Prolific, mentioned at p. 663, is a seedling raised from it with smooth instead of downy shoots as that has, and with blossoms so hardy as to withstand nine degrees of frost on the 3d of last May, which killed every thing besides, among fruit. The trees are standards. Its fruit is perhaps a little longer than those of its parent, it is more juicy, and brisk in flavour; in shape and appearance much like it. It is indeed a Precoce de Tours *hardenized.* Why should not we gardeners make a word? There is another seedling from the same parentage like the above, now common in the nurseries; for both have been in being nearly 20 years, called the Early Favourite. This has downy shoots, is a trifle earlier, of higher flavour, but not so hardy. "J. B. W." should tell us where he lives, and whether he cultivates the Plums he mentions as standards, or against walls, as such information satisfies readers and prevents many enquiries. Your correspondent has omitted to mention two very valuable and very hardy late Plums, Coes Late Red, and St. Martin's Zwetsche, a yellow Plum of excellent quality and most profuse bearer, as a standard or pyramid. *R.*

Peach Stocks.—About 10 years ago I planted, by way of experiment, a Grosse Mignonne Peach in the middle of a small pit, and trained it right and left to a trellis a foot from the glass. As it increased in growth I kept giving it more room, and it progressed tolerably well; but I never felt satisfied with it. In one year, however (1847), I gathered 8 dozen of fine fruit from it, in July and August; but with that exception it never produced more than a few dozen, until this year, when I had 10 dozen well set and stoned on it. In July, however, when the swelling process was going on, it died, just before the crop was ripe. The cause of death was, the stock being one mass of gum and canker. I never perceived the stock to be affected before this season. It was either a Peach or Nectarine stock, as I ascertained by a sucker which sprang up from a surface root. Gardeners should beware of the kind of "stocks" such trees are "worked" on. Why not bud them on the old Mussel Plum, as formerly, which is clear and bright as glass. In the "Theory of Horticulture," p. 239, you say, concerning stocks, "It is sometimes desirable to increase the hardiness of a variety, and grafting or budding appears to produce this effect to a certain extent; not, indeed, by the stock communicating to the scion any of its own power of resisting cold, but by the stock being better suited to the soil of latitudes colder than that from which the scion comes, and consequently requiring a lower bottom-heat to arouse its excitability." Mr. Knight, indeed, denies this fact, because "the root which Nature gives to each seedling plant must be well, if not best, calculated to support it;" and it is so, under the circumstances in which the species was first created, but without this addition. The paragraph in inverted commas is specious only, not just. Probably in Persia, the native country of the Peach, that species, or its wild type the Almond, is the best stock for the former fruit, because the temperature of the earth is that in which it was created to grow; but in a climate like that of England, the temperature of whose soil is so much lower than that of Persia, the Plum on which the Peach takes freely, is a "hardy native, and suited to such soil, and its roots are aroused from their winter sleep, by an amount of warmth unsuited to the Peach. And experience in this case completely confirms what theory teaches; for, although there may be a few healthy trees in this country growing upon Almond stocks, it is perfectly certain that the greater part of those which have been planted have failed; while in the warm soil of France and Italy, it is the stock on which most of all the old trees have been budded." The above quotation is sufficient to show what stock a gardener should prefer, and what stock a nurseryman should reject. *W. Brown, Merevale Hall.*

Liverpool Parks.—In justice to Mr. Milner, by whom Mr. Paxton's plans for the Prince's Park, Liverpool, were executed, I beg to correct a mistake in the leading article of last week's *Chronicle*, where the superintendence of the work at that park has been ascribed to me. The only park here with which I can claim any connexion is the Birkenhead Park, designed by Mr. Paxton, and formed by me, under his inspection. *Edward Kemp, Birkenhead Park, Oct.* 28.

Names of Seeds.—I have been considerably struck by the letter of your correspondent "D., Woolwich," on the subject of Grass seeds (p. 684, *c*), in which he complains that he cannot understand the Latin names of the Grasses recommended by you. On the other hand, he sends a list of names which he does understand, some of which it is probable that we all apply in a similar manner, namely, red and white Clover, Cocksfoot, and Rye-grass; but what does he mean by "suckling," "hay seeds," and "Cock-grass?" Surely these local names are quite as puzzling as the scientific names given by you. Local names must always be ambiguous, for I have found that the same name is applied in different districts to different plants; and it

is, probably, quite unnecessary to add, that the same plant has usually several local names. How, then, is the inquirer in one district to understand an answer if it is conveyed in local names alone? He may very possibly be led to sow the seeds of Grasses quite different from those recommended. The only mode by which certainty can be attained is, that of which your correspondent complains, namely, the use of the scientific names of the plants which are known to all good seedsmen, to whom alone any wise man will apply for his seed. You have given the list again, and added what you justly call, "the Latin names translated;" and I put it to your correspondent to say if he is any the wiser for that translation. He will understand the few of them which are not really translations, but substitutions of universally-known English names for the scientific ones, but surely the others are quite as likely to be unknown to him as the Latin terms themselves. Where a real English name exists I think that it ought to be used, but can see no use in requiring people to learn a name translated into English which will be understood only by those few who have learned it, whilst the Latin or scientific name is intelligible to all seedsmen who understand their trade throughout the world. Allow me, in conclusion, most strongly to recommend your correspondents to avoid the use of local terms in their communications. You will remember, and so will most of your readers, very numerous instances of ambiguity caused by their use. All who have not the means of learning a scientific or generally used English name for that about which they write, should send a specimen to you for your determination, in order that the true name may be inserted in their communications. *C. C. B.*

The Plum as a Pyramidal Tree.—For some few years I have amused myself by forming my Plum trees into pyramids, feeling convinced that no other mode of cultivating our hardy fruits is so eligible for small gardens. I was induced to take extra pains, on account of observing that our neighbours the French, so famous in their cultivation of pyramids, failed to a certain extent with the Plum; as their trees, I observed, on being pruned to that shape made too vigorous shoots, and were inclined to gum. They do not know the value of root-pruning, and will not listen to it; I do, and therefore felt some hope of success. At first I commenced to root-prune once in two or three years, but I soon found that was not enough, for the Plum makes roots so rapidly that it is difficult to check it; I have now, therefore, for the last three years root-pruned annually, early in autumn. My success is perfect; this I have generally done in September, soon after gathering the fruit, but this year not having any fruit, and awakened by your article on "Summer Root-Pruning," given in *Gardeners' Chronicle* in July, I operated on them in August; the trees almost immediately went to rest, and are now pictures of forthcoming fruitfulness. The operation is so simple, that any one may exercise it without any fear of failure. Let me attempt to describe it; and yet how irksome it is to have to employ so many words about what one can tell and do in a few minutes. Open a circular trench, 18 inches deep (for the Plum does not root deeply) round by one tree 18 inches from its stem; for the first two or three years this distance will be enough; increase the diameter of the circle as years roll on, but very slowly, not more than from 1 to 2 inches in a year, and cut off every root and fibre with a sharp knife. This operation may be likened to the manner in which old folks talk of the way in which they used to cut the hair of poor workhouse boys, viz., place a basin on the boy's head and trim off the hair round its rim—in short, the "workhouse cut;" then when your roots are so trimmed, introduce a spade under one side of the tree and heave it over, so as not to leave a single tap root. Fill in the mould; if the weather is dry give the tree a soaking of water, and it is finished. If your soil is poor, give a top-dressing of manure, to be washed in by winter rains. The following summer pinch off the ends, in June, of any shoots that seem inclined to push more than 4 inches, and thin those out with the knife that are too crowded; the result will be a handsome and highly prolific pyramidal tree. Plums are not yet half appreciated; for, owing to the introduction of many new and good varieties, they are in season from July till November, for the dessert and for the kitchen. *T. R.*

Stent's Kidney Potato.—Alluding to your account of my seedling, given at p. 659, I beg to protest against the plan pursued by you in its cultivation; and my reason for so doing is the result of my own practical experience with the same kind of Potato for the last three years. I, however, perfectly agree with you, that no one can determine what is the best plan to adopt with the Potato, under various circumstances, the accounts from practical men being so conflicting. I planted this year half an acre with my seedling, on ground which had been well manured in autumn, and had been laid up rough through the winter. The sets were all planted whole—a point of great importance, and they had not been allowed to sprout before they were planted. It was late before they made their appearance above ground, but every plant grew well, and possessed a healthy appearance, until the beginning of September, when the leaf became spotted, and showed marks of disease. Past experience having convinced me that the plan of removing the tops does not prevent the progress of disease, but that it tends greatly to diminish the size of the crop, I allowed them to grow until they were quite ripe, which was about the 24th September, when I commenced digging them, and I am happy to state that I have a very abundant produce, though not so large as on previous years, and it is nearly clean of disease, at least not more than half a bushel is at all affected out of 4½ tons, from half an acre of ground; and, as regards quality, they are not to be surpassed by any other kind in the kingdom. The reports of several respectable gentlemen in this neighbourhood, whom I supplied with a few sets in spring, perfectly confirm the above statement, and they are of opinion that my seedling only requires to be known to be generally cultivated. *W. Stent, Stockworth.*

Fry's Sulphurator.—I have no desire to occupy your pages with useless controversy, that savours only of party interest, from which no public good can be derived; but, in justice to myself, I deem it necessary to state that when my friend Mr. Epps wrote to me for my machine, he did not mention for what purpose he intended it to be applied; had he stated that his object was to diffuse sulphur amongst the Hop plants, I should have informed him that for that purpose it was of little use. I have previously mentioned that the machine sent to Mr. Epps was a copy of the original one which I first introduced; six only of these were made, when improvements suggested themselves. Mr. Epps states, with reference to the one he received from me, that it was of little or no use, throwing the sulphur scarcely 6 inches, and that in a very imperfect and clotted condition. Now, this is a mistake, which I am prepared to prove, as I happen to have in my possession one of these now discarded machines. With it I can throw the sulphur 2 feet, in a finely diffused state, by simply reducing any lumps that might be found in it, and using it perfectly dry; and I advisedly assert that whatever machine may be employed, this important point must not be overlooked, as the least humidity will cause the particles of sulphur to adhere, and impede the perfect action of the machine. Having had occasion to apply sulphur rather extensively this season to various crops, for the purpose of destroying mildew, I was led to believe that a far more efficient mode might be adopted than that hitherto used either by myself or any one else, and the result was the production of the machine sent to Mr. Epps. I however soon found, by experience, that although I could use my first contrivance advantageously, in some cases it was not adapted for general purposes. This was no sooner discovered than improvements suggested themselves, and these improvements not only enabled me to dispense with a considerable portion of the machinery, but, independently of this, rendered the contrivance perfectly effective in its operation; so much so, indeed, that the second-size machine, weighing under 3½ lbs., will throw sulphur from 6 to 10 feet with ease. This has been attested in many of the leading establishments near the metropolis, by some of our best gardeners; and, as I stated before, I now leave the public to judge of the respective merits or demerits of the two machines. *George Fry, Manor House, Lee.*

Foreign Correspondence.

Churra Poonji, Khasiah Hills, *Aug.* 28, 1850.—My friend Major Jenkins, of Assam, is exceedingly anxious to promote the interests of science, and of Mr. Simons, the apothecary to his station (Goahatty), by recommending the latter person, and circulating his prospectus.* Of Major Jenkins and his eminent services, you probably know well. His avocations prevent his doing all he would wish, and he has appointed Mr. Simons a sort of deputy. The latter is a most meritorious and intelligent man, a very worthy one, too, I am assured on all hands; and to any one willing to patronise him with a small order, he would, I am sure, give all the attention and plants he promises. He is further remarkably neat-handed and orderly, and dries plants exceedingly well. It is quite incredible how few Europeans there are in India who have any zeal for such matters. Major Jenkins is one of those few; nor in the broad Company's dominions is there any one who has more zealously and effectually rendered assistance to every one who has called on him, for full 15 years past. I have now been for two months in these hills, working with my friend and old schoolfellow, Dr. Thomson, who occupies part of his furlough in India, and will return with me to Europe early in the ensuing year. He has been working quietly and steadily for now 10 years past, and I find him one of the soundest and best instructed botanists I ever met with; well read, and more or less versed in all departments, and with bundles of MS. descriptions of live plants drawn up with the greatest care and exactness, and which will prove of inestimable value, including as they do upwards of 1000 species, especially Acanthaceæ, Cucurbitaceæ, and other difficult orders. He has botanised over the plains and hills of N. W. India, Thibet, Affghanistan, Cashmere, and spent three months with me in Sikkim; accompanied me here, and as we hope to visit Chittagong, Arracan, Ceylon, and the Sonderbunds before we return, Thomson's botanical experience will be little short of Griffith's. His N. W. collections have just gone home to England in 28 chests, most beautiful specimens, and in perfect order, with many duplicates. The variety and beauty of this flora is quite astonishing, and we have so much to do in noting and examining the many new genera and ill-understood old ones, that the work is too much for one individual to do properly. The jungles on the plains are inaccessible (for malaria). During the rains we are confined to the hills, and mere excursions to the Terai of a few hours. The latter, too, is so under water that the flora is much poorer than we expected, and elevations of 2000 and 5000 feet are probably by far the richest in number and curiosity of species. Luxuriance is confined to the flanks of the hills facing the plains of Assam and Sylhet, and to the gulleys leading up thence. The hill-tops are naked of much trees, and grassy, producing a very European vegetation. Orchideæ are by far the most remarkable natural family, and will probably form fully one-tenth of the Phænogamous flora. Grasses are the largest family. I gathered 50 species in one afternoon, in a seven miles walk, at 4500 and 5000 feet elevation; only three of them naturalised; almost all were tropical genera. We dissect and describe everything we possibly can, but put far more into spirits, especially curious tissues, fruits, &c., the flowers of Orchideæ, of which we shall have a fine collection, at your service I need not say. We look about for monsters, of which I saw a most extraordinary and suggestive one in Calcutta, a double Dendrobium. By the way the alternation of the placentæ with the stigmata which you quote as objectionable to the ordinary view of Orchideæ structure is surely very common, and not alone in Monocotyledonous plants. I have a beautiful Melanthaceous genus, in which I have traced and drawn this modification, and which will, I think, explain it clearly. I am astonished to find the ovary of the common Scindapsus quite erroneously described, and that its structure is opposed to the description of the whole order, or sub-order, whether classed with Aroideæ or not; there are two branched parietal placentæ projected into the cavity of the ovarium, with many ovules in each, just like Didymocarpus, in short; at least it is so in five species. I have, however, a very similar congener (not Pothos) in which the ovules are few and basilar. Commelyneæ are very curious; I find the ovules, when two, always superposed, and always orthotropal; Griffith describes them as anatropal; and he is also in error in supposing the position of the cells of the ovarium to be abnormal; in Cyanotus it is so only in appearance. Amongst Scitamineæ I have some most curious plants, one with a one-celled ovarium, and parietal placentæ with three or four anatropal ovules; there are no traces of more cells at any stage. The whole order, I should think, wants revision; and all the species should be examined, if not drawn fresh. Impatiens is a splendid genus here, and from a careful examination of Hydroceras, and many species with four lateral sepals, I am convinced that Roeper's theory is the right. I have now examined nearly 40 species, with the same result. After all, I look on the appearance which the back-piece presents, of being formed of two petals, with a green sepal adnate behind, as the most anomalous looking point in its structure; such a view is, however, untenable with any hypothesis, or with fact. The position of the flowers of Hydrocera is quite proper in the young state, and becomes resupinate afterwards. We have three Parnassias here; and I must really beg respectfully to remonstrate against the classing them away from Saxifrageæ, and especially with Hypericineæ, with which they have scarcely a character in foliation or floration in common. Nor can I appreciate Griffith's allying them to Villarsia; in short, as you will say, I can appreciate no view but that I adopt. Here I have found another species of Helvingia, which I still think a reduced Aralia. Why does Griffith deny stipules to Bucklandia? (I believe he does.) They are identical with those of Leea and other plants. I know no tree that would be a greater ornament at home. The Khasya Pine is quite different from P. longifolia, and in habit a perfect resemblance of Scotch Fir. We have also the Yew here and two Podocarpi. Sabia and Cardiopteris are the two most remarkable plants I ever examined. By the way, you still hold your opinion of the peristome of Mosses being whorls of leaves. The Calyptra I know is, and I made a great many analyses of these points 10 years ago, at sea; it may be a convolute leaf, or many leaves with a valvate vernation or plicate one. But what I wanted to ask was, whether you ever examined Quekett's specimen—what he gave me had not a seta at all, nor any traces of pistillum, bulb, or vaginula. The supposed seta was a shoot, as was to have been expected from the way it was produced. I have often tried to coax Mosses into monsters in vain. I showed Quekett's specimen to Wilson, who knows it to be no monster of a seta, and detected it indeed at once, before I spoke.

* We referred to this at p. 610 of the present year's volume, and it has been since advertised in our columns. We should say that a more favourable opportunity of importing Assam and Khasiah Orchids can never occur. The list with which Dr. Hooker has favoured us contains several plants not named in Mr. Simons's first catalogue, and fresh additions must be made frequently.

Reviews.

The Sugar Planter's Manual, being a Treatise on the Art of obtaining Sugar from the Sugar-cane. By W. J. Evans, M.D., 8vo, pp. 244. London, 1847.

The Practical Sugar Planter: a complete Account of the Cultivation and Manufacture of the Sugar Cane. By Leonard Wray. 8vo, pp. 415. London, 1848.

The Manufacture of Sugar in the Colonies and at Home, chemically considered. By John Scoffern, M.B., 8vo, pp. 160. London, 1849.

Copies of Report and Correspondence on the subject of Dr. John Scoffern's Patent for Refining Sugar, presented to Parliament, 14th August, 1850. Folio, pp. 18.

When several books are published nearly at the same

time upon any art, it is generally evidence that considerable improvements and changes are being effected in it, or at all events that it is exciting a good deal of interest amongst those practically engaged in carrying it on. All this is certainly the case at the present time in respect to the manufacture of sugar, which for a long series of years had been conducted in the West Indies in the same unvarying and imperfect mode, but which, within the last dozen years, has attracted the very serious and earnest attention and study of those most interested in it—an effect partly produced by the gradual improvement of sugar manufacture in other countries, and partly caused by the very low and depressed state of West India produce generally.

In 1842 the Governor of Jamaica, the Earl of Elgin, anxious to promote the welfare of the country committed to his charge, offered a prize of 100*l.* for the best essay on the cultivation of the Sugar-cane. This produced eight essays on the subject, and Mr. Thomas Henney, whose essay received the prize, states in the very commencement, "I am of opinion that the unprofitableness of most sugar estates, of which the proprietors justly complain, is in a great measure attributable to the imperfect manner in which the system of cultivation is carried into operation, and the too little attention paid to the all important subject of the economy of manure." These essays hardly go into the manufacture of sugar, their chief object being the cultivation of the cane, but Mr. Henney observes, that notwithstanding the imperfect condition of the manufacture, and the numerous attempts which have been made to improve it; yet that during the 25 years over which his experience extended no real improvement had been effected in the process.

Sugar is manufactured in different parts of the world, chiefly from four plants—the Sugar-cane, Maple, Beet, and Palm. The mode in which the process is carried on, of course varies a good deal, but there is at the same time also a considerable degree of similarity, inasmuch as in all cases the formation of saccharine matter in plants depends on the same physiological and chemical conditions, and the separation of the sugar from the impurities, or rather the other vegetable secretions with which it is associated, is in all cases attended with the same difficulties; dependant on the very nature of the sugar itself, and the peculiar qualities of the substances with which it is mixed in the juices of the plant. There are three points especially of interest and deserving attention in the manufacture of sugar, and at present we shall wholly confine our remarks to the sugar of the cane; these are, firstly, the formation of sugar in the plant, secondly its extraction, and thirdly its purification—including under this latter head not merely the manufacture of muscovado or raw sugar from the cane juice, but likewise its purification by the refiner, and the manufacture of white or loaf sugar.

The object of the sugar planter is, to obtain the largest possible quantity of saccharine juice, at the least possible cost, from a given number of cane plants. That this is not done may be learnt from a very slight consideration of the modes of culture employed, and the manner in which the various operations of the sugar farm are carried on. Mr. L. Wray even goes so far as to designate the whole system as an "entangled mass of mischievous practices, encouraged and supported by self-interest, old custom, and deeply rooted prejudices." It is unnecessary for us to say anything, however, on the mere practical and mechanical arrangements of the sugar plantations, such as drainage, irrigation, use of ploughs, choice, care, and management of cattle, &c.; the consideration of these matters, though doubtless all important, as regards the profits of the sugar manufacture, and the interests of the holders of West India estates, would lead us too far from the main question now before us. In planting Sugar-canes, as in most similar agricultural operations, the first thing is to break up, cleanse, and pulverise the soil. Rows of holes, 2 feet distant from each other, and three or more feet apart, are then dug about 10 inches deep; one or two cuttings or joints of Sugar-cane are placed at the bottom of each hole, and then covered with about an inch of mould; the hole not being filled up again to the surface, so as to leave the cutting covered with soil, at the bottom of a small cup-shaped cavity or basin. Shoots are put forth in about a fortnight, and the earth is gradually filled into the hole, as the young plants grow. During the formation of the canes, the earth is from time to time loosened and weeded, and when the canes are judged to be ripe, or to contain the greatest quantity of saccharine matter, they are cut and carried to the mill. From the roots and stools of the canes, which remain in the soil, a number of suckers soon spring up, which are termed rattoons; these are not so large as the first crop of canes, and diminish in size and value each succeeding year. By properly manuring the plants, and constantly loosening the soil about their roots, a good crop of rattoons may be had from the same plants for a number of successive years; but as they always gradually deteriorate, it is the custom to plant with fresh cane joints, every year in rotation, that part of the farm which has been longest yielding rattoons.

The quantity of sugar formed by the canes or rattoons varies not only with the kind of cane, the nature of the soil, the climate, and the greater or less degree of care bestowed on its cultivation, but likewise on many other minor circumstances; the average proportion is stated to be nearly 18 per cent., and the quantity of juice contained in the cane is about 90 per cent. Practically, however, a very much smaller quantity is obtained, because from the imperfect machinery employed, and the incomplete manner in which the cane is pressed, not more than from 50 to 60 per cent. of juice is usually procured; frequently indeed it is as low as 36. In the better mills they obtained from 70 to 75 per cent.

The sugar farmer has, in fact, two opposite objects in view in the cultivation of the cane; he wants his plants to grow fast and luxuriantly, and at the same time he wants to prevent them from vegetating *too* rapidly. If the canes grow quickly and rankly, a good deal of the sugar formed will be consumed, serving as food for the plant itself; and, besides, the rank luxuriance of the leaves, by forming a thick mass of vegetation, checks the access of air and light, and consequently prevents the canes from ripening. Accordingly, as soon as the plants are beginning to grow too rapidly, they are *trashed*, a certain number of leaves being stripped off; this checks their growth, and, if properly done and judiciously timed, effects the object in view; but if, as is often the case, it is ignorantly and indiscriminately done, more harm than good must result. In many cases the canes are planted too thickly, they grow up weak and thin, and, as a remedy, they are "heavily trashed;" thus they are deprived of the very organs designed for the elaboration of organic matter at a period when those organs are especially necessary.

Very great uncertainty appears to exist as to the best time for cutting the canes, and the period required for their ripening. The planting season varies a great deal in different places, depending in many cases on the setting in of the rainy season; but where artificial irrigation is possible the canes may be planted at all periods of the year. A good and complete series of experiments on this subject, well designed and carefully executed, would be of very great value. It is certain, however, that the different varieties of the cane, cultivated on different soils, and exposed to dissimilar seasons, will require very various times to ripen, and that the cutting time must be made to depend entirely on these different circumstances.

A healthy plant, growing freely and supplied with abundance of food, elaborates organic matter from the gaseous substances existing in the surrounding air; it forms leaves and woody matter; but besides these it has another and a very important function to perform—provision must be made for the next year's plants. In the case of annuals this is done by the formation of seed; growing points or embryos are generated, surrounded with a small but sufficient store of suitable organic food, and enclosed in a shell or husk. In trees or plants which live more than one year there is besides this yet another mode in which the life of the plant is carried on. At the close of the growing season buds are formed; these closely resemble seeds; they are growing points, properly protected, and supplied with a suitable store of organic food. The substance usually formed for this purpose by plants is starch, but in some cases sugar is deposited instead of starch; of this we have an excellent example in the Sugar-cane. Sugar, then, is formed in the cane during its season of growth, and deposited in the stem as a store of food for the future buds. During the first few weeks of the season no sugar can be deposited, because it is all employed by the plant in the formation and development of new leaves and stem; but as soon as the first vigour of vegetation is moderated, though the formation of sugar still continues, it ceases to be so employed, and is then deposited in the cells of the stem, in those parts where it will be most serviceable to the buds and other points of future growth. It is evident from even a slight consideration of the economy of vegetation that the store of sweet matter thus collected and preserved in the cells of the Sugar-cane must differ very materially from the thin, watery sap from which it is elaborated; one very important distinction depends on the larger quantity of azotised matter which the latter contains. It necessarily follows that, in cutting the cane when it is perfectly ripe, a larger proportion of saccharine juice will be obtained, in proportion to the quantity of mere cane-sap, than at any previous period of growth; and it is highly desirable, for several reasons, to procure the sweet juice as pure as possible. Dr. Evans very justly remarks on this point: "How essential is it, therefore, to attend to these circumstances, and rather suit the crop time to the cane, than, as is too frequently the case at present, suit the cane to the crop time." The loss occasioned by cutting unripe canes is not merely that of the sugar which would have been formed, if they had been left to ripen, but also that a quantity of foreign matter is introduced with the crude sap, which renders the subsequent purification of the sugar more difficult, and occasions, as we shall presently show, an absolute loss in the sugar already formed by the plant.

In crushing the Sugar-canes in the mill, there is, however, always another object in view besides the mere extraction of the juice, namely, the preservation of the megass (as the fibrous woody residue is termed), which is dried, and then constitutes the chief fuel employed in the subsequent evaporation of the juice. In consequence of this, the sugar-maker is anxious not to crush the canes too thoroughly, as the value of the fuel would be thus injured, and he is rather content to lose nearly half the sugar for the sake of the combustible residue. It is hardly necessary for us to make any observation on this part of the process; it speaks for itself; but we may remark that the sugar thus sacrificed contributes very little to the value of the fuel; because, from the large quantity of moisture left in the megass, it is dried slowly and with difficulty, and generally undergoes more or less putrefaction or decay.

Miscellaneous.

Plant Sales.—The kind of prices which Mr. Linden's Orchids, mentioned at p. 659, realised, are as follows:—Uropedium Lindenii fetched from 2*l.* 6*s.* to 9*l.*; Sobralia dichotoma, from 2*l.* to 2*l.* 17*s.* 6*d.*; Eriopsis biloba, from 1*l.* to 3*l.* 5*s.*; "new genus resembling Houlletia," from 11*s.* to 2*l.* 12*s.* 6*d.*; Myanthus, sp., from 1*l.* 8*s.* to 2*l.* 12*s.* 6*d.*; Odontoglossum citrosmum, from 2*l.* 4*s.* to 4*l.* 5*s.*; other Odontoglossums, from 1*l.* to 5*l.* 10*s.*; Oncidium, sp., from 1*l.* to 1*l.* 10*s.*; Cycnoches barbatum, from 16*s.* to 2*l.* 2*s.*; "new genus, or Paphinia," sp., from 1*l.* 1*s.* to 2*l.* 12*s.* 6*d.*; Anguloa Ruckerii, from 1*l.* 18*s.* to 3*l.*; Warrea, sp., from 1*l.* 10*s.* to 1*l.* 16*s.*; Stanhopea, sp., 10*s.*; other lots, in all 194, fetched from 11*s.* to 30*s.* per lot.

Poisonous Effects from Zinc.—It is now some time since it was proposed by M. Leclaire to use oxide of zinc as a substitute for white-lead, with a view to avoiding the dangerous effects of the latter on the workmen. There could be little doubt that, in point of salubrity, oxide of zinc was an improvement on carbonate of lead; but it was still a matter worth determining to what extent the oxide of zinc was itself free from objection, and whether or not some precautions were necessary regarding its use. M. Flandin endeavoured to determine this experimentally. He rubbed animals over with ointments of oxide of zinc, of carbonate of lead, and sulphate of lead; and whilst he found that the two last always produced poisonous effects, he observed that the animals rubbed over with the oxide of zinc continued to enjoy their usual health. The following facts however show that the innocuousness of oxide of zinc must not be admitted so decidedly as Flandin supposes:—A man, aged 42, a labourer, entered, on 19th April, the Hôpital Beaujon, with all the symptoms of metallic colic. He had been employed for the 15 previous days at a white colour manufactory, along with five other other workmen, in barrelling oxide of zinc, and in repairing casks which had contained that substance, during which operation they were exposed to an atmosphere loaded with the powder of the oxide. From the commencement of their work he and his comrades experienced colic and a repugnance to food, and the wine and brandy which they took to excite their appetite were disgusting to them, and did not remove the clammy taste which they had constantly in their mouths. This man could not continue long at work. After 10 days of this employment, he was seized with vomiting, severe colic, accompanied by constipation, which persisted and increased in intensity so much, that he rolled on the floor in agony.—The iron wire employed for securing the corks of champagne is sent in bundles of 1 to 10 kilogrammes to workmen called *tordeurs*, who by a dexterous manœuvre cut and twist from 10 to 20 threads of wire at a time. These wires are then made up in packets of 1 kilogramme, and after being beaten with a bit of wood to make them even, are packed in bundles. Although this sort of work had been followed by the same workmen from 8 to 15 years, under very bad hygienic circumstances as regards ventilation, they never had experienced any evil effects from it till the beginning of January 1850, when the so-called galvanised wire (which is iron wire covered with a layer of zinc) was substituted for the common iron wire; and soon after the workmen began to complain of the taste as of a sweetish powder in the throat, an incessant tendency to cough and spit, shiverings and general mal-aise. The whole of the people employed in this branch of industry—two youths, two women, and two men—were affected by symptoms which were referable to zinc. Four had symptoms of general depression, with sore throat, swelling and ulceration of the tonsils, inflammation of the palate, white pellicles on the gums, salivation, fetid breath, colic and diarrhœa. In one the colic and diarrhœa were the only symptoms observed; in another the colic was accompanied by nausea, tenesmus, and obstinate constipation. The wires with which they worked had been made hurriedly and carelessly, and were covered with a dusty powder, which escaped abundantly during the twisting, and especially the beating of the wires. This powder consisted of zinc, oxide and carbonate of zinc, alloy of zinc and iron, iron and oxide of iron. It contained no trace of lead. These symptoms seem to have subsided readily, without treatment, on abandoning the occupation. With one exception, all the work-people returned to their work in from three to six days. That the symptoms were due to the exposure to the dust, appears from the circumstance, that in 15 days more the same work-people, in the same hygienic circumstances, resumed the same work, with the same galvanised iron, but free from all dust, and none of the phænomena, which were formerly observed, manifested themselves.—*Gaz. Med. de Paris*, 1st June, 1850.—*Chemical Gazette.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Chrysanthemums, Scarlet Geraniums, Cactus truncatus, early Camellias, Cinerarias, &c., ought now to be making a fine display in the conservatory; and to

ensure a continuance of this as long as possible, let them be freely supplied with water, and occasionally with weak liquid manure. Let careful consideration be given to the proper management of the stock of winter flowering plants, so as to secure an unvarying display, during the whole time in which they are most required; to accomplish which, the stock should be divided into a number of successions, and introduced at proper intervals. We do not by this recommend any one to try to make as few plants as possible serve the purpose; for we consider that no pains should be spared to make the display at all times as great and as good as the resources of the place will permit. But the thing should be managed so systematically, that the different periods shall be as much as possible on a par with each other.

Pits and Frames.—More careful attention will be daily necessary in these, to preserve the plants from the effects of cold and damp. Examine the plants frequently, and remove all decaying leaves or other impurities. Let them have every ray of light which our gradually shortening days will afford them; and whenever the weather will permit, let the sashes be removed. Even when it is too damp to admit of this, a free circulation of air should be ensured, by tilting the lights; which should always be done on the leeward side.

FORCING DEPARTMENT.

Pineries.—Do not allow the cold weather to seal up the ventilators of these houses; the admission of air must, of course, be gradually reduced in accordance with the advancing season, but this is a very different matter to almost discontinuing it. We make it a rule to give our night and day plants some portion of air, independent of that which obtains ingress through the laps. Let water be very sparingly used this dull weather, but have an eye to those plants which stand near the flues or hot-water pipes, as they are liable to get dry before their neighbours. Vineries.—All the houses from which the fruit is cut will by this time be converted into greenhouses; the Vines require to be kept cool and dry, and the plants want very nearly the same treatment; frost, however, must be carefully excluded. While the plants are in these temporary dormitories, particular care should be taken to keep them perfectly clean and free from insects of all descriptions, or these latter will leave broods behind them, which will be very troublesome another season. If possible, avoid putting plants into those houses in which the fruit is still hanging; but if necessitated to do so, let them be of such kinds as require the smallest quantity of water during winter, such as Crassulas, scarlet Geraniums, or semi-succulent plants, Cacti and other succulents, with young Vines in pots, Fuchsias, and various bulbous and tuberous-rooted plants in a state of repose. As the leaves of the Vines ripen, let them be removed; pinching them off at the apex of the leaf, and leaving the foot-stalk to fall off when its own time comes.

FLOWER GARDEN AND SHRUBBERIES.

If the perfect neatness usually expected in this department is rendered less imperative at this season, either by the temporary absence of the family, or by their permission, a very considerable saving of labour may be effected by cleaning the walks only, and allowing the leaves on the turf and amongst the shrubs to lay undisturbed till they have all fallen, when they may be cleared away from the turf at one operation, and those amongst the shrubs may be buried by slightly digging over the surface of the ground, thereby giving it a dressed appearance, and improving the condition of the shrubs by placing the decaying leaves in immediate contiguity with the roots. Another advantage in allowing one cleaning to suffice is that much injury to the turf is thereby prevented, for nothing damages it more than continually sweeping or trampling upon it when wet or frozen. The time saved by the course here proposed may be very advantageously employed in progressing as fast as possible with any new work which may be in hand in any department. It must be borne in mind, also, that a flower garden with empty beds, however clean and neat, has a very bleak, chilling appearance, and falls far short of the idea of a pleasure-ground, according to an English taste. Such a state of things is inexcusable, as sufficient shrubs may be kept, in a very small space of ground, to make the garden during winter cheerful, if not supremely beautiful. We adverted to this subject some time back, but not so fully as it deserved; and we hope that those who have not already done what is necessary, will lose no time in accomplishing it. It is not of course to be expected that the beds can all be filled with flowering plants; but they may with nice dwarf bushy plants of handsome evergreens.

KITCHEN GARDEN.

If the texture of the soil is very tenacious, all treading upon the ground should be scrupulously avoided while it is wet, as it is impossible to preserve it free and open, if it is compressed at such a time. The object should be to render it as pervious as possible to the winter frosts; for which purpose advantage should be taken of favourable weather, to manure and trench all vacant ground, leaving the soil as rough and loose as possible. Where any full-grown Broccoli, Savoys, &c., are occupying the ground which it is desirable to trench, they may be taken up, and laid in with their heads pointing to the north, on any spare piece of ground. Scotch Kale, Cabbage, or Brussels Sprouts, may be similarly removed, observing, however, to plant these in their original upright position, for the sake of their sprouts.

State of the Weather near London, for the week ending Oct. 31, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 6th 1834—therm. 63 deg.; and the lowest on the 3d, 1845—therm 20 deg.

Notices to Correspondents.

To our Correspondents.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

Back Numbers of the Gardeners' Chronicle: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volume for 1847, price 30*s.*, and volume for 1848, price 30*s.* 6*d.*, can still be had. The volume for 1849 is now ready, price 30*s.* The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—1, 2, 4, 6, 8, 11, 13, 14, 15, 16, 17, 18, 19, 20, 23, 24, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52.

1843—All except 19, 21.

1844—All.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 17, 18, 19, 20, 21, 23, 24, 25, 27, 28, 31, 39, 40, 41, 42, 43, 44, 45, 50, 51, 52.

1846—4, 5, 6, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 42, 43, 46, 48, 49.

1847—1, 2, 3, 4, 5, 6, 8, 9, 10, 13, 14, 16, 19, 20, 21, 22, 27, 28, 29, 32, 33, 36, 37, 41, 42, 43, 44, 45, 46, 47, 48, 51, 52.

1848—2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 47, 51, 52, 53.

1849—All except 46, 47, 48, 49, 52.

Back Numbers: Full price will be given for Nos. 48, 49, 50—1848; and 46, 47, and 49—1849.

Bees: *A Constant Sub.* The present is the best time to remove your bees. Having prepared the new apiary for their reception, so that there may be no occasion to disturb the stocks when once placed therein, select a cold dry afternoon, and just before dusk stop the entrance of the hives with cotton-wool, pulled out loosely, so as to admit the air through it. See there are no other means of escape for the bees; if any, stop with cotton-wool, and, if necessary, secure the hives to their boards. They will carry safely and best on a hand-barrow, though at this time of the year there will be little risk in using a light spring-cart. Having placed all your hives in their new situation, gently remove the cotton from the entrances, but leave it on the boards. The distance you name is favourable; and, if the above directions are followed with dexterity and coolness, there is little doubt of your perfect success. *Y.*

Bird's Hydrostatic Water Purifier: In reply to many enquiries that have been addressed to us, we can now say that we have had several weeks' personal acquaintance with the action of this instrument, and that it appears to us to be admirably contrived for filtering water perfectly. It is small, cheap, and attended with no other trouble than that of letting the water run for the first day or two. That is absolutely necessary in order to bring it into working order; but it is not necessary that during this time it should be employed as a filter. It is merely necessary that a stream of water should pass through it.

Bulbs: *A Devonian.* The letter to which you refer has not reached us. You should pack the bulbs in dry sand, inclosed in a coarse bag, or in a thin wooden box, kept out of the hold and away from the steam-engine. A cabin is the best place. The seeds should be put into a coarse canvas bag, and slung in a cabin. If you put them into a tin case they will certainly perish. You will not succeed, under any circumstances, in sending Magnolia seeds or Acorns to Australia. They will not keep. Better fill a Ward's case with small seedling plants. Fir seeds may survive if treated as we suggest—not otherwise.

Cape Gardening: *Acorington.* Send your friend, at Graham's Town, Melons, Vegetable Marrows, large Gourds, Vines or Grape-stones, Plum-stones, Portugal Cabbage, and any tender annual flowers you can procure.

Conifers: *C F P.* We would advise you to procure the two last Numbers of the Journal of the Horticultural Society, in which you will find a very carefully prepared list of these plants, together with their synonyms. The real Juniperus chinensis is a bush, hardy near London, though often reputed tender. Under that name is sold Juniperus excelsa. Your best plan will be to send up specimens of the plants in your possession, and then we can name them for you. Juniperus chinensis is the plant often brought from China in a stunted state as a vegetable monster. We can hardly suppose that Escallonia macrantha will be hardy in Durham; but we have no experience with it as yet. The coming winter, if severe, will settle the point. If you try the experiment of its hardiness, let us advise you to plant it out in June under a north wall, or in some place where it is effectually screened from sun during winter.

Cucumbers: *Alpha.* Cuthill's Black Spine is reported to be one of the best, both for early forcing and general purposes. ‡

Guano: *F S H.* You may use it with great advantage to Pines, Vines, and all such plants. It is best administered when mixed largely with water.

Insects: *W G.* The animals found in the water, in which guano bags had been put, are the rat-tailed larvæ or grubs of a two-winged fly (Helophilus pendulus) like a bee, which are generally found in cesspools, ditches, &c. *W.*—*A B.* The Apple twigs sent are infested, to a surprising extent, with a species of aphis quite different from the Apple blight or American aphis. The directions given in our last week's Number, p. 680, should be followed. *W.*—*C H.* Mr. Samuel Stevens, Natural History Agent, of No. 24, Bloomsbury-street, will supply what you want. *W.*—*J D.* Your Vines are infested with the common thrips. Our Number for October 12 contains a notice of successful remedies against it. See p. 646. *W.*—*G T.* The insects found upon the desks and amongst the books in your counting-house are a species of Ptinus (Pt. hololeucus), lately imported in great numbers with hides from Russia. We do not know upon what analogous substance it and its larvæ feed in this country, where it has rapidly propagated. *W.*—*T C.* We are always willing and anxious to assist our correspondents in their researches, even where they do not absolutely fall within the immediate range of the subjects of the *Gardeners' Chronicle;* but then we have a right to expect that our correspondents should take a reasonable share in the labour, either by bestowing a due amount of care in collecting and preparing the specimens sent for our opinion, or by attempting their investigation and examining their structures—the only means of acquiring a real knowledge of the subject. It is unreasonable to expect that we should undertake naming boxes full of Ichneumons, Muscæ, &c., in the worst possible state, and containing flies of different families sent with the same number.—*W.* — *Thanks.* 1 is the common ground beetle (Carabus violaceus); 2, the dor beetle (Geotrupes stercorarius); 3, the Turnip flea-beetle (Haltica nemorum). *W.*

Ixias: *Reader.* Pot them now, or it may be done in early spring, in a mixture of peat, loam, and sand, and place them in a cold frame.‡

Japan Lilies: *M W K.* As soon as the bulbs are sufficiently matured, which will be known by the decay of the leaves and stems, they had better be repotted; not that this is of importance at present, but it will economise space, and prevent the operation being neglected until after they have made fresh roots. The soil in which they have been growing ought to be entirely removed from the bulbs, and the latter divided as may be thought proper, for there will always be found about the crown of the parent some small bulbs, which may be placed in 4-inch pots. If the ripening has been complete, the roots will not be troublesome; but if not, there will be found a quantity of fresh roots remaining. When such is the case, leave them to themselves for some time longer; never pot while it is necessary to cut or break the stronger roots, but strip your fingers through them, in order to remove those that are decayed. The pots should be just sufficiently large to receive the bulb and strong roots adhering to it; give a moderate watering, to settle the soil, and place them in a greenhouse or cool pit. They will require no further attention until the season begins to excite vegetation, when they must be regularly attended to. Water as soon as you see signs of growth, but sparingly until they have made leaves, &c., to draw up and give off moisture.‡

Names of Fruits: *John Abell.* 1, Doyenné Gris; 3, Crassane; 4, Glout Morceau; 5, Passe Colmar; 7, Autumn Bergamot; 9, 14, 50, Brown Beurré; 12, Seckel; 13, White Doyenné; 10, 12, Golden Reinette; 13, 24, Blenheim Pippin; 17, Ribston Pippin; 19, Scarlet Crofton; 21, French Crab; 22, 26, White Russet; 23, Beauty of Kent; 25, Wormsley Pippin; 51, Urbaniste; 54, Alexander; 55, Hollandbury; 60, King of the Pippins; 63, Cat's Head. You may now remove young Pear-trees. If you thin the trees and enrich the soil, your Pears will not be so apt to crack. ‖—*S B.* 1, Doyenné Blanc; 2, Beurré de Capiaumont; 3, Passe Colmar; 4, Princesse d'Orange; 7, Seckel; 8, Beurré Diel; 9, Duchesse d'Angoulême. ‖—*D B, Bath.* The Golden Russet. ‖—*H R S.* Doyenné Blanc. ‖—*L C K.* The White Muscat of Alexandria. ‖—*C K.* The "Tottenham-park Muscat" is a white Grape, not distinguishable from the White Muscat of Alexandria. ‖—*G L.* Your seedling Pear is not equal to many others which ripen at the same time. ‖—*C R.* Your Pear is the Flemish Beauty, a fine specimen, but has been allowed to remain too long on the tree. It forms an exception to the general rule for gathering Pears, that of waiting till they part from the spur by merely lifting up without pulling. You must take the one in question much earlier, even before it acquires its crimson tinge. ‖

Names of Plants: *J D.* Athyrium Filix-fœmina. *S.*—*G W.* C. fuliginosa, no doubt.—*J Wilson.* Acropera Loddigesii.—*Subscriber.* We do not recognise your "Smoke Plant." It is either not in flower or the flowers have fallen off. Does it emit smoke on pressure? It looks like a bit of some Parietaria or Pilea.—*An Enquirer.* 6, Achania Malvaviscus; 4, A morsel of Strelitzia juncea (?); 2, Lantana Cammara; 3, perhaps a bit of the leaf of the Date Palm; 1, Crassula tetragona (?); 5 (?). It is quite impossible to name fragments like these, without flowers.—*R E.* 1, Achimenes Skinneri, variety; B. 2, A. pedunculata, dark variety; D. 4, A. longiflora major; 5, A. misera; 3, apparently a variety of A. hirsuta, but out of flower when received. ¶—*X W.* 1, Maxillaria concava; 2, Max. rhombea.—*W W S.* Victoria regia.

Norfolk Beaufins: *J G.* Pick them of an even size. Put them into a *slow* oven side by side, leaving a space between each. Lay over them an iron plate, which will press them down. Shut up the oven, and leave them to bake very slowly. When fit for removal they will be flat, as you see them in the windows.

Paxton's Cottagers' Calendar may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

Studding and Wiring Walls: *O.* Use eyed studs and galvanised wire stretched horizontally. Let the studs be built in the wall, and they should be forked at the ends to prevent the possibility of their being drawn out. They should be placed 3 feet apart in every second course of bricks. Let the wire be passed through the eyes of the studs, and screwed tightly at either end of the wall to keep it straight. Nothing but the eye of the stud should project beyond the face of the wall, and the wire should not be further from the latter than ‡ or ⅜ of an inch, just far enough from it to allow a tie to be easily passed between the wire and the wall ‡

Tropæolums: *Maria.* T. Lobbianum blooms in winter. If you examine it carefully, you will probably discover flower-buds on your plant now. Pot T. tricolorum when the "bulbs" show signs of growth. A mixture of loam, leaf-mould, and sand will suit them. ‡

Vine Border: *E F L.* If you do not intend to force the Vines, we should think that wooden shutters, without manure, would be sufficient covering for your border.‡

Misc.: *W Salcombe.* We are not acquainted with Riley's New Burdock Spinach. ‖—*P C C.* Fresh pig-dung from the sty may answer for Onions; but it is not so suitable as rotten dung. Dig it in a little deeper than you would the latter. As regards Asparagus, you cannot perhaps do better than follow Mr. Cuthill's directions on the subject, given at p. 611 of the current year's volume. ‡—*J J R.* Moss will answer your purpose.

SEEDLING FLOWERS.

Fuchsia: *Cavanensis.* Apparently not different from F. cylindriea.*

Salvia: *W C.* A pretty small growing scarlet Sage, which will be found useful for many purposes for which the stronger kinds would be unsuitable.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

ARTIFICIAL MANURES. — PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

IMPORTANT NOTICE.— EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

SMITHFIELD CATTLE SHOW.

NOTICE.—THE PRINTED FORMS OF CERTIFICATES to be filled up for STOCK and IMPLEMENTS intended to be exhibited at the forthcoming Show in December next can now be obtained of the Honorary Secretary. All such Certificates must be returned, properly filled up, on or before **Saturday, the 16th of November.**

In applying for the Forms for Stock, it is necessary to state the Number of the Class or Classes, as there is a separate Form for each Class.

Prize Sheets and all information can be obtained on application to B. T. BRANDRETH GIBBS, Hon. Sec., corner of Half-Moon-street, Piccadilly, London.

THE BIRMINGHAM CATTLE SHOW, 1850.—The CERTIFICATES of ENTRY, for CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and, with the PRIZE LISTS, may be had on application to the Honorary Secretary. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates. The entries close on SATURDAY, the 16th of November.

The Show will be held in the BINGLEY EXHIBITION HALL, BROAD-STREET. T. B. WRIGHT, Honorary Secretary.

Union-street, Birmingham, Nov. 2.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

AGRICULTURAL EDUCATION. — The Steward upon a large estate, in the South of England, has a vacancy for a well educated youth to be instructed in farming and general business. For particulars, address X. Y., Office of this Paper.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

The Agricultural Gazette.

SATURDAY, NOVEMBER 2, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Nov. 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.
THURSDAY, — 14—Agricultural Imp. Society of Ireland.

CHARCOAL is one of the most intractable substances; it will not dissolve in pure water, like many matters which the soil contains; it will not dissolve in rain water, *i. e.*, in carbonic acid water, as more than one-half of the soil will do; it will not dissolve in alkaline solutions, as all the rest of the soil will do. A dressing of flint could not be more useless and worthless for any influence on the land or its crops, than a dressing of charcoal is, for its direct and personal effect. Both might influence the texture of the soil, beneficially or injuriously, as the case might be: neither could furnish of themselves anything capable of absorption by plants as food. But there is a striking contrast between the two, nevertheless. Flint is useless in itself, and has no power over such things as may be useful. Charcoal is useless in itself, but has that power in a very remarkable degree; and it is in virtue of this power, and not in virtue of any contribution which itself might be supposed to afford to the wants of vegetation, that its remarkable fertilising properties exist. Thus it will absorb and retain large quantities of different gases: many times its own volume of ammonia, of carbonic acid gas, of sulphuretted hydrogen, and so on. And charged with them it will, as it becomes wetted in the land, give them out again to the roots of plants.

Mr. JASPER ROGERS, whether those who read his enthusiastic praises of his *protegé* may have been led by them to think that in itself it is a fertiliser, or not, has done good service by calling attention to its conservative influence over that of which we are every day suffering loss. It does not add to our wealth or our fertility one bit, but it is a strong box in which this fertility and the agricultural wealth dependant upon it may be retained, and their liability to waste restrained. It is a good thing to add to the soil, because the fertilising gases which the air contains may, by it, be more effectually captured for use by plants; and it is a capital thing to add to our dungheaps, because the fertilising gases which they evolve, and which run to waste, to the injury both of health and pocket may, by it, be retained for use by plants in the fields. It is in this way, and not for the atoms or particles of which it is itself made up, that it is useful. It differs from the soda ash and Peruvian guano and prepared bones and British guano, in comparison with which Mr. YARROW* tries to make it present a favourable contrast—in this very important particular, that they are all the food of plants, which charcoal is not—it is a collector of food, but otherwise it is useless.

Nevertheless in its real office it is most useful, and, as we have said, Mr. ROGERS deserves well of the country, notwithstanding the somewhat magniloquent style in which he has endeavoured to convince it of the service he would do it. Farmers will do well to use this charcoal, and let no one be afraid of any patent being in the way of its use.

We do not happen to farm near a peat bog. It is an unfortunate thing for us—for Mr. ROGERS is right in speaking of peat as a source of great agricultural and national wealth. But if we were, and had a right of turbary, we should make this charcoal and use it, too, without the leave of any one. We do not know the process Mr. ROGERS has adopted—but we know of processes in practice long before he wrote on the subject: and we do not know of his particular method of using peat in dung-heaps: it may be ingenious, and may deserve the monopoly which a patent gives; but we know of methods which have been in use for many a year before the date of his. And no one, we repeat, need fear there are not ways of using charcoal, whatever source it come from, on a farm, without running risk of infringing any sound patent whatever.

We recommend any who hold such fears to look up and read what has already been published in our volumes on the subject. See especially in that for 1844, pp. 8, 69, 71, 184, 295, 319, 362, 466, 467, 505, 720. See also the papers in the 5th and 7th volumes of the English Agricultural Society's Journal.

* Peat Charcoal, &c., &c., by T. A. YARROW, C.E. JOHN KENNEDY, Portman-place, Maida-hill, London.

"MUCK IS THE MOTHER OF MEAL."—It is not to uphold the truth of the old proverb, as still obtaining in our own country, that we aim at now, but to compare the circumstances of our own farmers with those of farmers in other countries, and to ask the important question—Is "muck the mother of meal" in America as in England? Of late years we have heard so much of the benefit which our countrymen receive who cross the Atlantic, to inundate our markets with corn from the immense forests and savannahs of the new world, that one would almost believe that the mother of meal was better cared for, and more prolific in America, than in England, if not a different personage altogether. It may be useful, therefore, if we invite the attention of our readers to a muck and meal review of American agriculture.

Taking a general view of American agriculture, notwithstanding the corn exporting resources of that country, her farmers, instead of being able to send corn to England, would have some difficulty in supplying the wants of their own people and those of fresh settlers, were it not from the fact that they have a never-failing supply of unexhausted soil always at hand to fall back upon. The virgin soil of the forest and savannah may not unaptly be called the dunghill of the American farmer, for in it he finds that supply of food for the growth of corn which the English farmer finds in his straw-yard. The elements of food consumed by corn are in both cases similar, so that both farmers are equally dependant upon the respective sources from which they derive it, and "muck is the mother of meal" in America as in England, although differently husbanded. The peculiar character of JONATHAN'S dunghill, however, requires a little further exposition in order to convey a proper idea of its economy, for the forest and savannah soon disappear before the industry of the colonist—not so the mother of meal.

In taking a more detailed, but still general review, we find between the rude beginnings of the settler, and the consummation of American farming, *three* stages in the progress of improvement, which we shall briefly glance at.

1. In England we always commence our system by manuring our fallow lands; but in America we have to substitute the forest for the fallow crop—one by no means profitable or easy harvested. When the soil, however, is once broken up, it generally contains an extra quantity of vegetable matter, sufficient to supply food for several crops in succession, and such are accordingly removed from it. But although it does contain this excess, unless decomposition is assisted by burning or otherwise, it is seldom that the wants of plants are properly supplied, owing to its inert state for the first season, so that the second and third crops are frequently, if not invariably, better than the first. Sometimes, again, when burning is resorted to, too much straw is obtained—more than can support itself, and great losses are consequently sustained. After the lands are broken up, they are cropped with corn so long as the crops are remunerative; and when they fail of being so, the exhausted soil is laid down to Grass, while the fresh plots annually broken up by the settler fill up the blank in the arable acres required for cropping.

2. The second stage commences when allotments are wholly broken up, and when the first lands laid down to Grass are consequently brought under a second succession of corn crops, and ultimately laid down a second time to Grass: and when the next Grass lands undergo similar treatment, and so on.

3. The third and last stage, and that which approximates the nearest to the practice of the mother country, is when the different provinces begin to fill up with the growth of society, and an increased demand is consequently made upon the soil in the immediate neighbourhood of towns for all products of the farm, more especially those of heavy transport, such as green crops, dairy produce, &c.; a demand which gives rise to the same economy of manure and labour as is practised in England.

Such is the progress of American agriculture, and although there may be exceptions, yet these must be few; for the different practices imposed upon parties are arbitrary in their character, and cannot wholly be got over by them; as, for instance, although the allotment of the settler chances to be contiguous to a large town, and the transition from one stage to another consequently more short than if he were situated at a distance, yet the different stages must be gone over independently of this, before he can attain to that system of husbandry which is his ultimate aim, and which confers upon him the greatest amount of profit with the least amount of toil.

Now, in reviewing the different steps in the ladder of American agriculture, together with the working of the *three* systems and interests of parties consequent thereon, it will readily be perceived that the position of the American farmer is by no means so flattering as some would have us believe, when compared with that of the English as a competitor in the English market.

In the first stage the settler, on his arrival at the forest, is generally short of cash—a condition which is true, whether he is from the old world or the new; and if he is able to purchase a cow to give milk to his family, and a horse to perform the carting, and join the cow in the plough, it is the utmost he can do in the way of live stock, so that he is necessitated to push the unexhausted soil to the utmost to get over difficulties greater and more embarrassing perhaps than the liquidation of the debts which hang over his allotment. And even in cases where a moderate amount of capital is at command, a different system cannot be adopted with profit, for the want of consumers generally on the one hand, and the competition of the other two classes ahead in the progress of improvement, on the other. At a large expense of drudgery the settler is compelled, as it were, to undersell them in corn, but he cannot compete with them in the other products of the farm, owing to the peculiar character of his dunghill, or practice. And even in the growth of corn he experiences many serious disadvantages, especially when compared with the third class, and still more so with the English farmer; for, granting that he has the richest soil naturally, it being the least exhausted from over-cropping, he does not derive the full benefit of its natural fertility, because the practice which the rude state of the country and his own pecuniary circumstances arbitrarily prescribe, does not confer upon him the maximum amount of produce which it is capable of yielding under different treatment, so that, although the maximum may be 48 bushels per acre, yet the average may only be 30, while the practice entails upon him the expense of breaking up fresh lands annually from their original state, at an expense of about 5*l.* per acre on an average, in order to get a fresh supply of manure from his dunghill.

The second stage, again, is just the old out-field system of the mother country—a system expensive because profitless, as some of our readers can no doubt certify from experience. It is, however, doubly so in America where the expense of labour is double that which it is in England, and more than double in the marketing of corn for export. The position of the American farmer, however, upon the whole, is better, because he has got over the life and death struggle of a colony, and is beginning to gather independence as he approaches towards the third stage; both his live stock and stack-yard have been gradually increasing, so that he is now beginning to dispose of a cow to a new settler, and a fat beast to the butcher, besides lots of dairy produce and poultry. He grows less corn, but more of the other class of products proportionable to his labour and arable acres; and as settler after settler arrives, and his own family grows up, the American laird of the third stage makes his appearance with a still greater abundance of both classes of products.

Again, the primitive settler sometimes enjoys the happiness of the last stage, but as often bequeaths it to his successor. If he has four sons they do not remain long with him after they are grown up, as they often do in England; two may go into the manufacturing and commercial interests when boys, one becomes a settler in the interior of the country at 20, and the fourth may remain at home with his father, and in order to avoid the subdivision of the lands; upon his shoulders devolves the payment of his brothers' portions. So that life is as keen a struggle for bread in the new world as in the old, and farmers are equally loud in their complaints about bad times and low prices. No doubt there is an abundance of corn and every kind of agricultural produce, but only consequent upon an amount of labour and toil, of which farmers in the mother country know comparatively little, especially as regards the produce of corn. The erroneous conclusion, that the new world yields its increase at a less amount of labour and manure than the old, can only be arrived at by farmers who shut their eyes altogether upon practice, for our readers may rely upon the fact, that such conclusions were never realised by either English, Irish, or Scotch emigrant, who have sought a home in the forest of America. A very different reception awaits him on the confines of the forest. Were not such the case it would never have been said that "parties brought up in commercial and manufacturing towns are ill adapted for a colony." The fact that many farmers possessing capital have returned from America, after surveying the prospects of American agriculture, and embraced farming at home as the more profitable of the two, is proof practical on the subject as to profits and labour. Owing to the diversity of practice the interests of the three parties are as much against each other as that of all is against the interest of the English farmer. The farmers of the first class are interested in cheap cattle and everything they require to purchase until their farms are properly stocked, when they merge into the second class. The farmers of the second class, again, and also of the third, are interested in high priced corn, cattle, and agricultural produce in general, on the one hand, and cheap labour on the other; but the first class keeps the market full of the one, and empty of the other, so that they experience the opposite of what they want, viz., *cheap corn* and *dear labour*. The farmers of the third class could grow more corn and cattle were it not for the low price of cattle kept down by those of the second class (who are still struggling under greater difficulties and are consequently more necessitated to work hard and sell at a low price), as well as by the low price of corn, together with the expense of labour, and the distances from places of export and the English market. Were it not for such facts, grumbling about bad times would never be heard of; but when twice the price of English labour is paid, and only one-third of the English price of butcher-meat received, how can an Anglo-American keep from grumbling, and how can he grow corn for the English market cheaper than the English farmer could, seeing he has the broad Atlantic between him and Mark-lane, and it may be several hundred miles of rough road into the bargain? And if he cannot, how can we be undersold by the principal American corn growers of the first class, who are situated some hundred miles further into the interior of the country?

Practical farmers are generally fond of experiment, and therefore if any dissent from our conclusions, they may try an experiment of a few years across the Atlantic, and report on results. Some of our readers may probably think that if they are to be called upon to pay their labourers' wages and tradesmen's accounts twice—5*l.* per acre for a first manuring, with an extra expense of marketing on the one hand, and only receive on the other one-third of the present prices for fat stock, or 18 bushels less per acre, as the produce of corn, with only present prices, it is useless to propose the journey to them. Try it who like—if such are the conditions of the case, we prefer casting our lot among those who shall continue to farm at home! *B.*

GREEN MANURES.

[The following correspondence has lately been published by Mr. Nesbit of the Scientific and Agricultural School, Kennington; on the relation, as fertilisers, between a green crop wholly returned to the soil, and the excrements of the cattle fed upon it.]

"Firstly: It is well established that animals, in breathing, give back more to the air than they derive from it. They receive nitrogen and oxygen, and return them again, plus a certain excess of nitrogen, carbonic acid, and aqueous vapour. Animals also transmit to the air much in insensible and sensible perspiration.

"Secondly: The experiments of Boussingault and others have shown that the liquid and solid excrements of animals weigh less than the food from which they have been derived, and that, as regards the food, excretæ are deficient in *nitrogen*, carbon, and hydrogen.

"Thirdly: It is well known that animals consume a considerable portion of the farinaceous and oleaginous portions of their food for the production of *animal heat*, and that the greater portion of the excess is laid up in the form of fat; and that of the nitrogenous portion, part is consumed by the voluntary and involuntary motions of the muscles, and part forms fresh flesh for the growing animal. Of the inorganic matters of the food, a portion is required for the formation of bone. It is, therefore, quite clear that there must be much less manuring matter in the excrements than in the food, of which they are merely the unconsumed remains—*the ashes*.

"Fourthly: It is known that animal and vegetable substances are composed of the same original elements; that all animal particles have first had vegetable life; and though the proximate changes and combinations of their aliments are almost innumerable, yet that the results of the ultimate decomposition of animal and vegetable matters in contact with air are the same.

"Fifthly: To sum up: if, as it has been proved, the excretæ of animals weigh less than the food they have eaten; if there is a diminution of the most valuable of the ingredients in passing through the animal; and if, in their ultimate decomposition, the food and the excretæ give the same products, it follows that the products of the decomposition of the original food will be greatest in quantity and richest in quality; but practical experiments are, in this instance, so easily made, that I should be wrong if I omitted to mention some of the numerous facts which experimentally prove the truth of my assertions. Mr. W. Trumper, of Dorney, near Windsor, Mr. Oakley, of Rochester, and others, have forwarded me the results of trials made on their respective farms. Mr. Trumper, in a field of Rape, part fed off by sheep, and the other ploughed-in, found in the succeeding Wheat crop a difference of a quarter per acre in favour of ploughing-in. I insert letters from some other gentlemen who have also found favourable results."

"Letter I.

"My dear Sir—In reply to your letter I am instructed to say, that the members of the Farmers' Moon Club, in the neighbourhood of Rochester, Kent, unanimously agree that vegetable manures are peculiarly fructifying, and that, taking the case of a fallow or other field, being all previously of the same tilth, and sown with Rape for feeding, and divided into three divisions, one of which shall be fed off with sheep, without any extra food to the Rape, the second division ploughed in, and the third division fed off with oil-cake or corn; that the worst corn succeeding the Rape will be on the first division, the next best on the second, and the best on the third. Thus all speak in favour of green crops for manure.—Yours truly, John Oakley, Old Broad-street, August 10, 1849."

"Letter II.

"My dear Sir—I regret I was not at home to answer your inquiry sooner, having been in Yorkshire the last fortnight; however, I hasten to send you the required information. In the spring of 1846 I had more Turnips than my stock could consume; I, therefore, thought that it was reasonable, that if the crop was broken to pieces, and ploughed in, the grain crop that followed would derive as much benefit as if eaten by sheep. I therefore did so with one acre on the first week in February, and with another upon the fourth week in March. Part of the rest of the field was eaten on the land, and part being newly ploughed up land, the whole crop was drawn off. On the land where the Turnips (White Rounds) were broken and ploughed in on the last week in February, the produce was 84 bushels per acre of Hopetown Oats. Where the Turnips were broken and ploughed in on the fourth week in March, the produce was 74½ bushels per acre. Where eaten on the land by sheep, 70½ bushels per acre; and on the newly-ploughed up land the whole of the crop drawn off, 41 bushels of Wheat. I hope that this will be satisfactory; if not, I will make it so.—I am, yours faithfully, Peter Love, Naseby, May 15, 1849."

"Letter III.

"Dear Sir—I have just seen Mr. Underwood, who was a neighbour of mine 18 years ago, but is removed to a distance. He says he has practised ploughing-in a few acres of Turnips, almost every year for upwards of 20 years, and considers three sacks of Barley per acre quite within bounds, as the increase from ploughing-in over feeding-off. The Clover is much better; but he has not observed the Wheat sufficiently to say what the difference is. He estimates an average acre of white Turnips to be worth 30*s.* more to chop and plough-in any time before they begin to run to seed (say February out), than to feed off. I inspected a field of Wheat, this week, belonging to John Gurdon, Esq., which was white Turnips three years back; a part were ploughed in, and the rest fed off with sheep, and half-a-pound of oil-cake per day each given to them. The Wheat, where the Turnips were ploughed in, is decidedly better than the rest; I think three bushels per acre. Mr. Hudson, the steward, told me the Barley was quite a foot higher than the rest of the field, and three sacks per acre, if not more, better. The Clover was all fed off, and no notice taken; nor would anything more have been thought about it, had not the Wheat looked so much better than the rest all the spring. The Turnips were about three-quarters of a plant, but regular; the sheep went down with the epidemic, and were sold, leaving about two acres of Turnips to feed; and rather than purchase any more stock, they were ploughed in. As I told you at the club, I am generally a buyer of Turnips; but the obstinacy of my neighbour, Mr. Underwood, who refused to take 20*s.* per acre for his to feed off (for the sake of convenience to me) when almost every body else were giving theirs away, attracted my attention to the after crop; and I can, in two instances, confirm his statements. Notwithstanding, if 1½ cwt. of Swedes (I think a ton of Swede Turnips will make 14 lbs. of mutton, from experiments I have tried) and 2 cwt. of white Turnips will make 1 lb. of mutton, and we can grow 21 tons of the former and 26 or 28 of the latter, it must be more profitable to feed at 5*d.* per lb. for the mutton than to plough in at 20*s.* or 40*s.* per acre in the corn crop. I have been unwell, and could not see the parties, or I should have answered your note before.—Yours, &c.—Thos. Hawkins, Assington Moors, June 15, 1849."

"It may be necessary to say, that in ploughing-in a green crop for manure, great care is necessary in choosing a suitable time, and that it be not allowed, by too long growth, to become fibrous, so as to delay its decomposition in the soil. For Turnips, February or early in March is quite late enough, and the best effect is seen where they have been touched by the frost.

"It is scarcely needful to say that the arguments advanced do not apply to sheep fed on Turnips with oil-cake, unless an amount of oil-cake equivalent to that consumed by the sheep in one instance were ploughed-in with the Turnips in the other.

"In conclusion, I reiterate that my object has been, not to prove that ploughing-in is profitable, in comparison with feeding-off, but rather to elicit a principle which, if once known and understood, may, on many occasions, as when stock is dear, and green crops abundant, be brought into beneficial and profitable practice. *J. C. Nesbit, Scientific and Agricultural School.*"

ANIMAL HEAT.

Many works and letters have been published on agricultural chemistry, farming operations, draining, irrigation, and other subjects relative to the tillage of the soil; but one of great importance having escaped the notice of those scientific men who have within these last few years thrown so much light upon the subject, I will, in as concise a manner as possible, endeavour to point out the cause and effect of animal heat.

Life cannot exist without heat, for in cold-blooded animals and even fishes their bodies will always be 2° or 3° warmer than the medium in which they live. Heat may be produced by friction, as is done by the Indians in rubbing two pieces of wood together to light a fire, or by the chemical process of carbon and oxygen mixing with each other and forming carbonic acid gas. Carbon, in this way, is a great source of heat, and is the principal chemical ingredient of all fuel, used in fires, lamps, and candles. Twenty-one per cent. of the air we breathe is oxygen, and without it no animal can live, and the union of carbon and oxygen is the cause of animal heat. All kinds of food consumed by the animal creation must contain carbon in proportion to the temperature of the climate in which they live, and their appetites will direct them to select the food neces-

sary for their sustenance. The organs of digestion are exquisitely arranged, for when the food is introduced into the stomach it is by the action of the gastric juice (which is secreted from the lining of the stomach) reduced to a pulp and removed to the liver, where it is purified, and then conveyed through the lungs, where the carbon is open to the action of the air that is breathed, and being converted by the oxygen into carbonic acid it produces heat, and is conveyed by the blood to every part of the body. At each inspiration an animal imbibes a certain quantity of oxygen from the atmosphere (which is composed of 79 parts of nitrogen, and 21 of oxygen), and must meet with a proportionate quantity of carbon to maintain life. Animal and vegetable food contain carbon in different proportions; that of fat bacon or pork as much as 80 per cent.; this may be easily imagined when we consider that candles are made from fat. After lighting the wick the atmosphere supplies it with oxygen, and in uniting with each other they produce light and heat. If the extinguisher be placed over it the light goes out, for nothing can burn without oxygen, and an animal kept 10 minutes without air will die.

The quantity of oxygen that is breathed regulates the appetites which are to supply the systems with carbon sufficient to keep the blood always at the same temperature; for, from the authority of the best authors, and the practice of many scientific men, the heat of the blood in a man in Lapland is 98°, the same as at Calcutta or any other place on the face of the globe. In England the appetite is greater in winter than in summer, for one-eighth more oxygen is inhaled in the former than in the latter season; for the same air that fills a bladder of 80 cubic inches with air in winter will fill one of 100 cubic inches in summer. The heat expands it. In summer we breathe less oxygen than in winter, for the warmer the season the thinner the atmosphere, and the organs of digestion are in a great measure regulated by the season and the climate. In this we see a wise provision, the blood of animals being always at the same degree of heat. A man travelling towards the Equator cannot inhale so much oxygen, consequently he loses his appetite, and does not keep up so great a fire within him; on the other hand, another moving towards the North Pole will become voracious, as the condensed atmosphere will require so large a quantity of carbon to maintain the standard degree of heat. Persons living in the East Indies, or any other hot climates, exist upon fruits or food not containing more than 12 per cent. of carbon; those in the Arctic regions will eat at one meal 5 lbs. of blubber, or any fat meat, and drink train oil or brandy in proportion. Under the equator animals will eat less, and bear hunger for a long time, but in a cold climate hunger will soon cause death. According to Liebig, an adult in taking moderate exercise consumes in one day $13\frac{9}{10}$ oz. of carbon, and the conversion of $13\frac{9}{10}$ oz. of carbon into carbonic acid, will require 37 oz. of oxygen, and that animals differ in the temperature of the blood in proportion to the respiration and size of their bodies; for instance, the heat of a child is 102°, and an adult 98°; in birds it is from 104° to 105°, and in animals from 98° to 100°. From this it appears that a child, whose respiration is quicker than in a man, requires food more frequently; a bird deprived of its food will die on the third day, and a serpent being sluggish in its breathing will live three months or more without food. I have stated that fishes are warmer than the element in which they live, but although they are generally under water they are not without air; the finny tribes are all provided with a bladder containing air, and according to the expansion of the vessel that contains it, they rise to the surface or sink to the bottom; no doubt the small quantity of air contains a sufficient quantity of oxygen, which, uniting with the carbon found in their food, will produce heat, making them from 2° to 3° warmer than the water. The pulse and breathing may be compared to the weight and pendulum of a clock, for one regulates the other. Great exertion will cause quick breathing and a palpitation of the heart, and it may be imagined that it may raise the temperature of the blood; but such is not the case, for science and observation will show that animals are protected against excessive heat. In a steam-engine its speed or power is regulated by its furnace, and as the water becomes more rarefied, the strokes of the piston become more frequent; but when it arrives at a certain power, the pressure from within opens a safety-valve and liberates the extra quantity of steam. In animals a quick pulse and quick breathing may produce more heat, but to keep the circulation always at the same temperature, our skins are provided with pores, which open like safety-valves to let off the heat by means of perspiration.

It is here necessary to observe that dogs and some other animals never sweat, but when running the tongue is protruded, and perspiration is secreted from that member, and the mucous membrane of the mouth. It has been supposed that in racers, hunters, &c., the decrease of fat is attributable to perspiration; but it appears to be from another cause. The quick breathing of a galloping horse may have the same effect upon his fat as the blacksmith's bellows have upon the coal; the coal (which is carbon), by receiving a strong current of oxygen from the bellows, is soon reduced to cinders, and the fat (which is also carbon), is reduced by the oxygen that is breathed. Carbon, hydogen, nitrogen, oxygen, and sulphur, are the ingredients of fibrine, gluten, and casein, which constitute blood, and being conveyed by the arteries to every part of the body, and having deposited the fibrine, which is the chief ingredient in muscle, and its carbon, which is the chief ingredient in fat, it is returned by the veins and undergoes another chemical change.

Fat animals can live longer without food than those in low condition; a fat pig was once overwhelmed in a slip of earth and lived 160 days without food, "and was found to have lost 100 lbs. in a month." Trans. Linn. Soc. vol. xi. p. 400. In an animal kept without food the oxygen will apply to the fat for carbon to keep up the heat of the body; after that it will go to the muscles and leave them soft and weak; lastly, it will attack the brain and there cause delirium and death. The appetites of animals may be increased by a bracing air and exercise; but the quieter they are kept the faster they will feed, provided the sheds, cow-houses, or boxes, are kept at a moderate temperature. Nature has provided the brute creation with clothing sufficient to support life in the climate for which they were ordained; but, to prepare cattle for the butcher, abundance of suitable provender, quietness, and warmth, are essentially necessary for so large a formation of fat. Welsh sheep, hares, and other animals living on the hills, and in a state of nature, never carry fat. Small and crowded cow-sheds are not so well adapted for feeding as those of larger and reasonable dimensions; a shed with a current of air from without will impede the feeding, therefore the stalls open at the back are objectionable. I have seen a building of this kind, and the progress of the cattle was scarcely perceptible, until it was closed with sacking to the height of 6 or 7 feet from the ground; the cold atmosphere then passed through the ascending air, and was warmed before it reached the animals below, and they fed twice as fast. It would here be well to adopt the system as followed in the cheese-rooms of large dairy countries, to have the roofs of the cow-sheds or feeding-boxes lathed and plastered, and the space between them and the tiles filled with saw-dust, to keep the warmth at a moderate temperature. Saw-dust being a non-conductor of heat, in winter it will prevent the snow (on the roof) absorbing it from within, and in summer the interior will be quite cool; while the tiles exposed to a burning sun will be so hot, that it may be painful to hold a hand upon it. By these means great savings may be effected, and, ere long, I hope to see in your *Gazette* a detailed account of the advantages derived from a moderately warm feeding-house, over a bleak and cold one. *J. C. H., Croft Farm, Bridgnorth.*

Home Correspondence.

Fresh Air and Cleanliness are most essential to the health of mankind, and there is no difficulty in distinguishing the inhabitant of a densely crowded town from the agricultural labourer. The former has all the appearance of breathing a vitiated atmosphere, and the countenance of the latter speaks of inhaling purer air. The artisan who lives in an ill ventilated house, situated in a badly drained and narrow street, may have more food, in point of quantity, and may not so often go supperless to bed; but as to quality, there is a question whether the rural brother is not better off, though his wages are small. In London, and many other large cities, the stuff that is consumed by human beings, under the denomination of animal food, is revolting to think of over dinner; and diseased carcases sold to sausage-makers, converted into pies, boiled down into broths, well seasoned as potted meat, and thus disguised, supplied to the public, are enough to bring down upon us all the plagues of Egypt, and of every other country under the sun. No animal, intended for slaughter, should be permitted to enter through the gates of the metropolis. It is folly to talk of the expense of carrying meat from the suburbs, when such losses are sustained by goading the poor animals to that scene of cruelty and abomination—Smithfield Market, a positive disgrace to a civilised country. Scanty clothing, want of firing, and bad food, have much to do with low fevers, typhus, and cholera. Although every imaginable evil is attributed to imperfect drainage, and no doubt much mischief accrues from this cause, yet there are other things to be complained of equally injurious to mankind, and not without a remedy. Filth lying about the door-ways of houses, and open sewers in the neighbourhood, are the results of neglect on the part of the landlords and tenants; and common decency should be enforced by law, where a sense of duty has not sufficient weight on individuals to induce them to act right. The working classes, from their poverty, cannot protect themselves, and select houses in localities free from such nuisances. It is therefore incumbent upon those who have influence, wealth, and authority, to tender their assistance, and lighten the hardships they endure, by passing their lives amongst perpetual disease. To undertake half measures as a sanatory precaution, is like cutting a piece off the bottom of a garment, and sewing it on to the top, by way of increasing its length and breadth. To do one thing and leave the other undone is a mockery. To construct splendid sewers to carry off the liquid refuse from the haunts of men, and at the same time to allow the sale of unwholesome meat and vegetables is an anomaly so palpable as to excite the astonishment of all classes, particularly when there is a remedy at hand, which, so far from being an additional burthen to salesmen and butchers, would be a positive saving. Let four great markets be established between 5 and 10 miles from the heart of the metropolis, near the railroads, where animals can be accommodated and slaughtered without the barbarity now practised in galling and mangling their unfortunate bodies, and rendering their flesh unwholesome. We throw away thousands in vain speculations, with the hope of obtaining an exorbitant interest for money, which, from its nature must be fictitious, and can only be viewed in the light of a gambling transaction, terminating in the ruin of those who foolishly suppose that, when the legitimate securities of the country only give $3\frac{1}{2}$ per cent., they can insure 7 or 8 by investing their cash in a scheme which offers an unnatural gain. Such have been the extraordinary expectations from the railroads, where extravagance on the part of the management was quite enough to condemn them. The formation of receptacles for housing and killing sheep, oxen, and pigs, intended for the London market, under the direction of practical men, who could be depended upon to digest well their plans before laying a single stone, would become a most popular investment for cash and pay a fair interest. The population of the great Babylon would feel how much their comfort and convenience depended upon the project being carried out in a judicious and satisfactory manner. It is quite in vain to state the most startling facts with the hope of rousing the public to action even in self defence. Mere accident will probably bring about that which every one wishes, but few will take the trouble of inquiring into, although the most convincing evidence is laid before them. However, it cannot be too often repeated, that one-half of the population of London and all large towns are positively living upon impure food; a description of dogs' meat dressed up for the occasion and well spiced, which in this smoking, chewing, and dram-drinking age, a vitiated palate cannot discover, but an impaired constitution can and does. A little quiet agitation on the subject of the sale of improper food may be of use to the present and rising generations, if it induces the authorities to have meat destroyed, which is approaching putrefaction, and to consign vegetables in a state of fermentation to the dung-heap, instead of the saucepan. Half the stomach and bowel complaints proceed not so much from atmospheric changes as from eating bad food, temptingly prepared to entrap the unwary. Bread, beer, and spirits must be considered on some future day. Let me hope some persons will assist in exposing the mischievous system of buying and selling unsound food. *Falcon.*

On High Farming.—I am induced to say a few words upon this subject, from the observations made at a recent agricultural meeting by a reverend gentleman, a contributor occasionally to the *Gazette*, and a most excellent man and clergyman. He mentions a field of his that has been high farmed, and this I know to be true, having watched his operations with much interest, that has not yielded more than $1\frac{1}{2}$ quarter per acre of Wheat this last harvest, from blight; this is no doubt true from the appearance of the crop before reaped. Now I will just make a few remarks on what I consider the cause of this blight. This land, good land and in high condition, was Clover, and fed off by sheep with plenty of corn and roots. I believe this would be excellent treatment for the generality of the poor land in this part, but under the circumstances stated above I believe it to be erroneous; Wheat is a most delicate plant, and will not bear coming into contact with strong manure; if this land had been cut first and fed after, I have no doubt that there would have been a good crop of Wheat. This is well understood in the Isle of Thanet, the best land I know. The farmers there avoid applying any active manure directly to the Wheat crop, but put it upon the Clover ley, or what is still better give it to the roots, be they Mangold Wurzel or Turnips or anything else; it is impossible to give them an over dose, and I think I may challenge any one to say that he ever knew unkind Wheat after roots, particularly Mangold Wurzel. *E. X., near Braintree, Essex.*

Liquid Manure.—The plan suggested in your leading article of condensing the good properties of liquid manure by immersing bags full of peat charcoal, would I am sure be ineffectual. Charcoal possesses two properties, the first is the power of condensing great quantities of any gas, as ammonia, which comes in contact with it—it is this which constitutes its deodorising power. Charcoal has also the property of clarifying any liquor passed through it. It readily parts with the gas it absorbs,—for instance if it contain as much ammonia as it was capable of holding, and was in that state immersed in water, the ammonia would be dissolved out. If therefore liquid manure was passed through the charcoal, the ammonia it could condense would *only* be the portion that was dissolved in the small quantity of water retained in its pores. The liquid would be to some extent deprived of its colour by the removal of the colouring matter suspended, but not a fraction of the really valuable *soluble* matter would be removed. By immersing the charcoal, the only benefit would be the removal of that portion of the liquid retained in its pores, no difference would be made in what was left. *Celt.*

Education.—I quite agree with the opinion expressed by your correspondents, on the policy of promoting the education of the people generally. All parties must admit, that in the march of improvement the schoolmaster must lead the way; so that we gain the end we are seeking, it matters little how it is done; but we should be careful who we take as teachers of chemistry, &c. We have land agents writing class books for agricultural students, in which we are told that water contains 8 lbs. of hydrogen, and 1 lb. of oxygen, and another person, if I mistake not a druggist, who gives us his own analysis of soil, &c., and at the same time

tells us that nitric acid or aquafortis is composed of the same elements as water, but with two equivalents of oxygen instead of one; and public lecturers telling us that oxygen is sour, and that it will not support animal life. [Who do you refer to here?] We should be cautious of such teachers. It should, I think, be taught at the school, where a museum might be established to illustrate the principles of the sciences, as well as a collection of the vegetables cultivated in, and of plants indigenous to the district. A piece of land to cultivate the different kinds of Grasses upon might be added. Of the importance of this last, I received a good illustration the other day: a farmer told me he would sow no more Timothy Grass (Phleum pratense), for it was nothing but Couch (Triticum repens); and this from a gentleman who has received a better education than the majority of farmers in this district. Such a state of things require no comment. The scheme that I have here proposed requires no great outlay, the members of the class, and the boys of the school, might do nearly all for themselves. The support of the farmers is wanting, or rather it is necessary they should give it their countenance; without that it will never succeed. *J. Stollard, Ipstones, Staffordshire.*

Farm Accounts.—It is rather surprising that we have never seen any opinion expressed by competent persons, as to the comparative merits of the systems of keeping farm accounts, published by the Royal Agricultural Society, and in the "Cyclopædia of Agriculture." I wish some gentlemen would give us their opinions upon the above methods, for I am about to begin farming, and should like to commence with the most approved system. *E. F.*

Mangold Wurzel.—I shall be obliged for any information respecting the cause of a mixed stock and a number of runaway plants resulting from a true stock of seed, carefully saved from the long yellow Mangold Wurzel. On examination, the produce is in the following proportions, viz., 27 long yellow or the true, 18 long red, 13 yellow Globe, and 8 runaway. It was sown the early part of April on a piece of strong land, well manured with 4 cwt. of Peruvian guano to the acre. Would the runaways be caused by the dryness of the season, or how can it be accounted for? No long red had been grown near the roots from which the seed was saved; but some yellow Globe were growing for seed at the same time, at a good distance, on the same field. *B. T.* [Either the seed cannot have been true, or there must have been neighbouring plants of the other varieties.]

Long Dung and Short Dung.—Mr. George Summers has, it appears, been discussing one thing and I another. He says, "I wish it to be understood that the manure which I am here advocating is not that strawy material your correspondent would have us believe, but contains an abundance of phosphates, and a large supply of nitrogen in the shape of urea, uric acid, mucus, &c., which, by their speedy decomposition, will yield ammonia to the plants." Then it follows as a matter of course that such dung must be "speedily" used, else its "speedy decomposition will yield ammonia," and short dung will, after all, be the natural result. The question then occurs, how are farmers to stock their accumulated farm-yard manure, which contains an abundance of phosphates, urea, mucus, and other nitrogenous matter, so that it shall not undergo "speedy decomposition, yielding ammonia," &c., before it is removed to the field. I consider this to be a grave practical question, and deserves Mr. George Summers' best attention. *W. E. Gill, Truro.*

On Steaming Bones, &c.—I live near a town from which I can obtain supplies of fresh bones from the butchers, and stale bones from other sources. I intend to erect a small apparatus to extract the grease for the soap makers, and afterwards steam out the gelatine for my pigs, bearing the bone earth for the drill, &c. Now I shall be obliged by your informing me what pressure of steam is necessary to effect my object, and the length of time the bones ought to be subjected to that pressure. For some time past (I may say years), I have puzzled my brain for a power to supersede horse labour to a great extent (for we can never entirely do without that), in the labours of the field and barn. Steam in its present form is inadmissible, from its being expensive and cumbrous, and wants a great deal to eat and drink, to say nothing of the danger from fire, and an occasional burst. My present idea is on the principle of the pendulum for perpendicular, and the balance wheel for horizontal work. Take the pendulum for example. On either side of the pendulum, place an artificial magnet, to be worked by a battery in the same way as the one I remember seeing in the Polytechnic or Adelaide Gallery some years ago. By connecting one magnet at a time alternately with the battery, I think a powerful machine may be constructed. The magnet I saw was capable of supporting a great weight, and suggested my present plan. I shall look in the next number of the *Gazette*, to the "Notices," &c., for your advice and opinion. *G. W. B.* [The atomic theory indicates the quantity of magnetic energy capable of being generated, through an electro-magnetic apparatus, by the decomposition of a given weight of metal; and we believe it is in very rare cases indeed that the cost of metal will not exceed that of the coal consumed, in the production of an equal amount of power by means of a steam engine. Magnetic power has already been applied, but in a more economical manner than you suggest.]

Allotments.—I have often heard, in conversation, the objections of "A Practical Farmer" urged against the allotment system; but the boldness to reduce such objections to print is new to me. The insinuation that a poor man cannot be honest because he may wish to better his condition by keeping a pig, a cow, or by the cultivation of a rood of ground, is a libel upon the character of the English labourer. The objection to a poor man keeping a pig would hold just as well against keeping his own offspring. If a man would purloin food for his pig, he would purloin for his children: and if he be given to pilfering, he will do so, pig or no pig. I have always found the accumulation of property amongst the poor increase their regard for the property of others; but I fear if farmers generally had the covetous disposition evinced by "A Practical Farmer," our peasantry would be but little better than northern serfs. I do not doubt but that many a dishonest man is possessed of a pig; but I do deny that the possession of a pig ever made a man dishonest. *R. G.*

Societies.

HIGHLAND AND AGRICULTURAL, *October* 23:—*The best varieties of Wheat to sow; quantities of each; and comparative advantages of drilling, dibbling, or sowing broadcast.*—Mr. HOPE, Fentonbarns, said: The cultivation of Wheat is not the least important branch even of Scottish agriculture. In the best arable districts Wheat forms the staple crop, being the most valuable of all the cereals, and the one to which the farmer chiefly looks to obtain the means to pay his rent. This is the case throughout the Lothians, Fife, Berwickshire, and a great part of Roxburghshire, and in the Carses of Gowrie, Falkirk, and Sirling; while even from the northern counties, such as Inverness and Ross-shire, the Wheat sent to Mark Lane ranks high in the market of the metropolis of the world. The Wheats at present sown in East Lothian are Hunter's, Hopetoun, Fenton, and Red-straw White; all white Wheats. Almost the only variety of red Wheat grown to any extent, is Spalding's Prolific. There are, however, a number of other kinds, both red and white, which have for a time enjoyed public favour, or which are yet new, that are cultivated on a limited scale, such as Woolly-eared, Chiddam, Pearl, Brodie's, Gregorian, Trumper's Mummy Wheat, amongst the white varieties; and Blood-red, Lammas-red, and Creeping Wheat, amongst the red kinds. The Red-chaffed White, which is a distinct variety from the Red-straw White, is coming into notice, but, perhaps, both are too new to the district to be classed amongst the Wheats that have a permanent place in public estimation. The other Wheats, such as Heckling's Prolific and Whittington's, were as extensively sown immediately after their introduction, though speedily abandoned as worthless, but not before occasioning great loss to those who had sown them.

Hunter's Wheat is fully entitled to the honour of being first particularly noticed, from having been for the last half century the favourite with the majority of farmers in the Lothians, perhaps in Scotland, though it is curious it has never made its way in England. Most of you must be aware that it was picked up on the roadside at Coldingham Moor, by the late Mr. Hunter, of Tynefield, near Dunbar, and that it was to that gentleman it owes its name and fame. I need scarcely enter into any description of a Wheat so universally known and appreciated, further than to say that it is a white Wheat, though in some seasons many of the grains are very high coloured, clear, and flinty, which might make those unacquainted with it imagine it was mixed with red. The straw is of moderate length, the ear medium-sized, the chaff smooth and thin, but with a short sharp awn, and that the pickles are neither too closely nor too widely set. It possesses a hardy constitution, withstands well the winter's frosts, tillers freely in spring, and is as little liable to disease as any variety I am acquainted with. For more than a dozen of years it formed the standard by which I tried all other varieties, and though I have ceased to sow it for the last six years, for a reason I will soon explain to you, yet it still continues unquestionably the favourite Wheat with the great majority of farmers in the Lothians. I have tried against Hunter's various English Wheats, such as Taunton Dean, Tall Cluster and Dwarf Cluster, Kent White, and other varieties without any distinctive name; but though they sometimes grew much finer quality the first year after they were imported, they rarely yielded so much grain, and always rapidly deteriorated. The Chiddam and Pearl Wheats, though fine in quality, never yielded within a quarter per acre as compared with Hunter's.

Hopetoun Wheat was propagated and brought into notice by my friend, Mr. Patrick Shirreff, formerly of Mungoeswells, now farming in Wales, to whom the agriculturists of the kingdom are also indebted for the valuable Hopetoun Oat. It was raised from a head found by the late Mr. Reid, of Drem. It is a smooth-chaffed white Wheat, with a large head, and tall stiff straw. It has a magnificent appearance when growing, and consequently sometimes disappoints sanguine growers. It has been extensively sown both in Scotland and England during the last 10 years, and certainly, on the whole, does not appear to be losing favour. I have not grown it much myself, though I have occasionally sown a field of it, and at other times a part, in order to compare it with Hunter's. I never found it to exceed Hunter's in quantity or value, though it always came very close to it in both, which is more than I can say of many other varieties.

Fenton Wheat was propagated by my father, from three heads grown from one root, which were accidentally found, in 1835, flourishing in an old quarry, situated 200 or 300 yards south from the village of West Fenton. It was growing on the top of a heap of stone rubbish, and what attracted my father's attention was the shortness and stiffness of the straw. At the time I set this down to the poverty of the soil from whence it drew its support, and I thought it neither more nor less than Hunter's Wheat. Experience, however, soon showed me that it was a perfectly distinct variety. I think the heads of the Fenton Wheat are larger than the Hunter's, and that it comes into ear a few days earlier; the grains, also, are rather more closely set; the straw is much firmer and shorter, and with the peculiarity of being different lengths from the same stem, which causes the sheaf to be a mass of heads, from the band upwards. It should be cut when the grains are soft, otherwise the appearance of the sample is impaired; but when cut green it has the clear and flinty look characteristic of Hunter's, so that it is scarcely possible to tell the one sample from the other. I confess, the quality is more easily affected by the weather than some other kinds, as, when stacked damp, the grain gets dull and dingy. It is, however, by far the most prolific white Wheat that I ever tried, whether sown in autumn or spring. It is far from being a great crop in appearance; judging it when growing, or even after it is cut, you are apt to think little of it, and it is rarely that you feel satisfied, or that its superiority is manifested until it is put into the sacks. The weight of straw per acre is frequently as great as that of crops a foot taller. I have found from several experiments that the weight of the straw averages about one-fourth more than the weight of the grain, which is just about the ordinary proportion of other kinds of Wheat. What I esteem its chief qualifications, is its strength of straw; if *it* is lodged, most other kinds would be useless. It is, therefore, well adapted for high farming, which is happily now the order of the day, most farmers having discovered, that if manure is dear, land is still dearer, with its accompanying expenses. Six years ago, I sowed a 24-acre field, one half Hunter's Wheat, and the other half Fenton, the difference in favour of Fenton was fully two quarters an acre, from Hunter's being completely laid; since then, I have entirely confined myself to the growing of Fenton, except an occasional acre or two of any new well recommended variety. Had it not been that it would have looked like puffing what may be considered my own variety, I would have given you the results of some experiments in growing Fenton Wheat, in comparison with Hunter's and some other approved kinds. Should I have, in the judgment of any, already exposed myself to the charge of favouritism, I beg to assure them that I am quite unconscious of it; and that nobody would rejoice more than myself, were any new variety to be found that would supersede for general cultivation, all those at present known. I cannot conclude my notice of the Wheats I have found most suitable, without again alluding to Spalding's Red, which was introduced into Scotland some years ago from Norfolk. I ought to mention that it is the only variety of Wheat that in my experience has beat Fenton in quantity, though the money value per acre was rather in favour of the latter. On the whole, then, I have no hesitation in commending for general cultivation, on ordinary soils, Hunter's, Hopetoun, Fenton, for white Wheats, and Spalding's Red as the best red I know. With regard to the proper quantity of seed to sow, this depends so much on the quality and condition of the land, even on the size of the grains and the manner of depositing the seed, and above all, on the period at which it is sown, that it is in my humble opinion nothing less than absurd to attempt to fix any general rule. I may state, however, my own practice. When the land is fine and dry I drill from 8 to 9 pecks the Scotch acre, up to about the 20th of this month; after that I increase it to 10 pecks, and if sown in December to about 11. In spring I sow as nearly as possible 12 pecks or 3 bushels per Scotch acre. I am unable to say anything satisfactory regarding dibbling, never having tried it but on a very small scale, and then with very indifferent success, perhaps from my want of knowledge. I drill the greater part of my grain. Last year I had about 250 Scotch acres in white crop, of which 40 acres were sown with the machine broadcast, and upwards of 200 acres were drilled. I drill on purpose to get rid of annuals, and also to check that pest of my neighbourhood, wild Oats. Hitherto I have usually hand-hoed the whole of it, and I have often seen in spring when part only of a field was hoed, that in a few days, it assumed a darker and more growing appearance than the piece that was still to do, and once when the field was rather long in being finished, the earliest hoed maintained its superiority till the last. I have known that it is said, a turn of the harrows will have the same effect on broadcast Wheat. I have even seen very thin Wheat beneficially harrowed, in order to make it thrive, but this merely shows the benefit of stirring the surface. And surely the hoe can be applied with greater precision and effect to a drilled crop, then a pair of harrows to one sown broadcast. I do not think that it matters much to the yield of the crop, whether you drill or sow broadcast, unless you also hoe, and I have no doubt but that sometimes when there is an abundance of plants a turn of the harrows might be equally beneficial to both. I do not count much on the saving of seed by drilling, as the broadcast sowing-machine now in universal use deposits the seed as evenly and correctly as the best drills. Some weeks ago I ordered one of Garrett's drills and his horse-hoe to suit. The cup principle being, in my estimation, much superior to the plan of the Scotch drills, and the driver having a far greater command over the implement, the work will be better done, and the horse-hoe used with greater freedom. In this machine (but it is the only one) the Scotch have, in my humble opinion, sacrificed correctness of principle and efficiency of execution to a miserable economy. I would conclude by remarking that it has been supposed, from Wheat being the most valuable of our cultivated grains, that therefore it was the most exhausting to the land. So far as my experience goes, I am inclined to think this supposition erroneous—Wheat is much longer on the ground, and consequently must draw more of its support from the atmosphere than the other crops—at all events, I find that I have always better crops after Wheat than after Barley; and why 8 or 10 quarters of Oats should not exhaust an acre of land more than 4 or 5 quarters of Wheat, I cannot understand. If I am correct, you must see the absurdity of clauses in leases restricting the number of acres that shall be under Wheat. It is essentially a condition that the landlord imposes upon himself to receive less rent than he might otherwise do. It is true these clauses are generally intended to operate only during the last years of a lease, and it may be inferred that they only injure the farmer, but whatever impairs his pocket speedily tells on that of the landlord.

Mr. PATTERSON, Cowie, Stirling, said: The part assigned to me in this meeting is to read a brief statement of the experience and practice of the district of the Carse of Stirling, on the subject of this day's discussion. Allow me, however, previous to entering on the various topics included in that subject, to premise that the soil of the district referred to is a stiff alluvial clay—that the general preparation for Wheat has been, and still is, a bare summer fallow—that although Turnips are grown on every farm, and on some farms over the whole extent of their fallow brake, yet the proportion is so small, that it forms the exception, and bare fallow the rule, and to which soil, under such treatment, my remarks will apply.

1st. *To the best varieties of Wheat.*—Among the many varieties lately introduced the following four claim special notice, as having stood the test longest and been most extensively sown in the district, viz., Hunter's Hopetoun, Red-chaffed White and Oxford Prize, each possessing its own peculiar characteristics, receiving attention in proportion as the soils on which they are to be sown are fitted for their culture. Hunter's is a long strawed Wheat, and on rich soils somewhat apt to lodge; the sample is of a fine flinty staple, and much valued by the baker. Hopetoun is also a long strawed Wheat, yields fully better than Hunter's, but the grain is of a softer staple, and more subject to disease while growing. Red-chaffed White is a short strawed Wheat, grows generally a full crop, yields well, and requires to be cut green, as it sheds readily; the sample is very fine, and is also in much request among bakers. Oxford Prize is a short strawed woolly-eared Wheat, yields largely, but in damp seasons is particularly liable to be damaged by the weather. These, then, constitute the principal varieties grown, but the greatest demand in the Stirling market of late has been for Hunter's and Red-chaff, both by bakers and growers, which warrants the inference that they are the best varieties to cultivate in the district, and if there is any difference, it is in favour of the Red-chaffed.

2. *Quantities to Sow.*—The quantity sown is from 8 to 12 pecks per Scotch acre. Our sowing season extends from the last week in September till the middle of November, and in proportion as the sowing is early, and the soil in good condition, we give the lesser quantity—or later and damp, we give the greater quantity; if at any time we pass the middle of November, 14 or 15 pecks are sown, as the case may be; and when Wheat is sown after green crops, 2 or 3 pecks more seed is allowed than after fallow—seldom, however, exceeding 16.

3. *As to the comparative advantages of Drilling, Dibbling, and Sowing Broadcast.*—The dibbling of Wheat has never been practised in this district, so far as I am aware. A mode of drilling was introduced by the late Mr. Murray, of Polmaise, and practised by him the few last years of his life. He attached a seed-box to the common plough, and ploughed the seed in, in rows, in every furrow—covering to the depth of 3 inches, or thereby—the particular results of which I have not been able to ascertain. In October, 1843, I had prepared, for Wheat sowing, a piece of land which had grown a crop of Beans; wet weather had set in before it was sown, and I did not get on it again until December; part of the seed was then drilled in on Mr. Murray's plan, and the rest ribbed, and I could perceive no difference in the crop between the two modes of sowing. I did not follow the drilling farther, as it was attended with additional trouble and expense; this expense, however, may be lessened by using drill-sowing machines, and I have the satisfaction to learn that such a machine has been introduced into the district through the Messrs. Drummond, of the Agricultural Museum, and which has been in operation this week on the farm of Steuarthall, in the neighbourhood of Stirling, in the presence of several practical farmers and others interested in agriculture, who were highly satisfied with its work. The common practice is to make up the land four or five weeks previous to sowing, then sow broadcast and harrow. The mode of preparing land for Wheat which prevailed at one time was to give farm-yard manure to the fallow, with or without lime. Since the introduction of draining, this has been abandoned, as the crop, after such treatment, ran too much to straw. One thing, however, has followed, and which has been the principal difficulty we have had to contend with in the cultivation of Wheat; that where the land has been well fallowed, heavily limed, and not consolidated by wet or otherwise, previous to, or immediately after sowing, the plants are apt to die out during winter, particularly on the more easy soils. Various expedients have been resorted to to obviate this, and with varied success; the seed has been sown broadcast, and then ploughed in with a light furrow; it has been grubbed in with a heavy grubber, but neither of the plans has fully succeeded; the substitution of Turnip for bare fallow, in certain cases, has been approved of as producing the desired result. In the autumn of 1842, which was very dry, after making up the fallow in the usual way, part of it had been limed, I ribbed from 12 to 14 inches wide; sowed broadcast, and harrowed; the other part got Rape dust instead of lime, and was then sown broadcast; the portion that was ribbed stood the winter very well, and was a good crop; the other lost the greater part of the plants, and produced very indifferently. The system I now follow is to have the land made up about the beginning of August, in such a way as it may be sown, but if the weather is suitable plough it again about the end of September, about 14 days before sowing, to consolidate the land, and raise a clod to protect the plants during winter; if that cannot be attained, and if I consider the land not sufficiently compressed, or not enough of cover for the seed, I rib it as before described; this plan has the advantage of affording a sufficient cover for the seed, without breaking down the clod, or reducing it to too fine a tilth by repeated harrowings, and the plants stand the winter better by having a firmer hold of the soil. The question very naturally presents itself here—Why is the drilling of cereal crops not more practised as a system? To this it may be replied, that it is still deemed problematical, whether or not any of the benefits which accrue to the drilling of such crops on light soils would follow on the clays, and may, in a great measure, have prevented its extended adoption.

Mr. Scott, Craiglockhart, said: In regard to the questions submitted to the present meeting, I will offer a few observations:

1. As to the best varieties of Wheat to sow, these may vary in different localities. On my own farm I have tried various kinds, Hunter's, Hopetoun, Chiddam, Taunton Dean, Hicklings, Uxbridge Talavera, Red-chaffed, Red-strawed, Fenton, Pearl, and some others; but after repeated trials, I have found that on land in good condition for autumn sowing, Fenton is most profitable, next to which probably Red-strawed; the Red-chaffed is a short-strawed Wheat, which stands well up, but it is very liable to shake, and the straw breaks very much in threshing. For spring sowing, what has succeeded best with me is a variety of Talavera, and next to it Uxbridge; but the variety of Talavera which I have this season is the greatest crop I ever reaped of either spring or autumn sown; it was sown on the 12th of March and reaped on the 7th of September.
2. As to quantity to sow per acre. I have heard various quantities recommended, from two-tenths of a bushel to 4 bushels per acre. I have never tried dibbling, but for drilling or sowing broadcast after green crops, I have generally found it most profitable to give what some may consider rather a liberal quantity of seed, beginning in the early part of the season, that is the end of September or beginning of October, with 2 bushels, and increasing as the season advances, to 3 bushels per imperial acre, but I have seldom seen it advisable to sow Wheat in December or January; if it cannot be got us before the beginning of December, it is better to postpone the sowing till February, after which period, fully 3 bushels per imperial acre should be allowed, as thick sowing greatly promotes the early ripening of the grain, whereas, if too thin sown both the straw and grain will have a tendency to be coarse and inferior in quality. With regard to any advantage to be derived from drilling, I have generally found that on land which is perfectly clean, fully as great a crop will be obtained from sowing broadcast as from drilling, but if the land is dirty or subject to annual weeds, drilling is a decided advantage, by allowing the ground to be hoed in spring; with regard to dibbling, as before stated, I have had no experience, but I observe in the last Number of the Journal of Agriculture, a report of experiments made by Mr. Hay, of Whitrigg, in Roxburghshire, the two first of which is a comparative trial between dibbling and sowing broadcast, which shows that whilst the gross produce of Wheat, straw, and chaff is the same in both cases, about 4 bushels per acre of more grain is obtained from the dibbled portion. The quality of the dibbled Wheat is, however, decidedly inferior; it not only containing a greater quantity of light Wheat, but the good grain weighed only 59 lbs. per bushel, whilst the grain from the broadcast portion, weighed 62 lbs. per bushel. Therefore if the difference in value of the grain be taken into consideration it is doubtful if any advantage was gained by dibbling. I may observe that in the report an error has been made which may probably be a misprint; the produce of ¼ of an acre of each is thus stated:

Broadcast, 11 bushels 0 tenths, good Wheat 62 lbs. per bushel.
0 „ 1½ „ of light.

11 „ 1½ „ equal per acre to 5 qrs. 4 6-10ths bushels.

Dibbled, 11 bushels 9½ tenths, good Wheat, 59 lbs. per bush.
0 „ 2½ „ of light.

12 „ 2 „ equal per acre to 8 qrs. 6 8-10ths bushels.

Which should have been 6 qrs. 0 8-10ths bushels.

In both of these experiments, the seed was sown on the same day, the 28th September. The broadcast at the rate of 1½ bushel per acre, and the dibbled at the rate of half a bushel per acre, but the broadcast was reaped on the 19th of August, and the dibbled on the 26th, being a difference of seven days, a matter of some importance in a late season, and which, with the inferior quality of the grain, corroborates the opinion I had previously formed as to the result that might be expected from thin sowing. In the same report Mr. Hay states that he sowed a field of Wheat on the 26th of August, at the rate of nearly 2 bushels of seed per acre, which proved to be too thick, and that it did not turn out so well as expected, the head being small, but it was reaped on the 13th of August, and weighed 63 lbs. per bushel, being six days earlier, and 1 lb. per bushel heavier than what was sown with 1½ bushel of seed; however, this cannot be considered as a comparative trial, having been so much earlier sown; had it been sown with 1½ bushel per acre, and that sown on the 28th of September with 2 bushels, it would have been a better proportion of seed; but I should think it doubtful if at any time it be prudent to sow Wheat so very early as the month of August, as the plant has a great tendency to get too far advanced before winter, and run to straw with a small head—to use an old local phrase, to be "winter-proud and bum-bee headed."

Mr. Finnie, Swanston, said: I will briefly state the results of two experiments I made with different varieties of Wheat:

In the autumn of 1836, farmers were much impressed with the idea that some of the English Wheats could be introduced with advantage, and participating in the same feeling, I was induced to make a comparative trial of those of them most in vogue, with a selection obtained in the Edinburgh market of Scotch Wheats, but which, unfortunately, the day I did so, I found to consist principally of Hunter's more or less pure. The autumn was most unfavourable for the raising of the Potatoes, and the wet weather immediately setting in, these two causes had led me almost to despair of sowing the field with Wheat that season. A favourable opportunity presented itself on the 21st of December, and upon a portion where the soil was most inferior, I sowed the following kinds; they were all cut the third week of the succeeding September, after a certain extent of land was measured off, in order to decide their respective productiveness. The following results were obtained:—

	Weight per Bushel.—bush. lbs.
No. 1—Wheat selected in the Edinburgh market having no particular name, but very much resembling Hunter's—gave ...	6 60
„ 2—Said to be a pure sample of Hunter's Wheat	7 61
„ 3—Uxbridge White Wheat	7 61
„ 4—Smooth-eared White	7 60
„ 5—Carrington White	6 58
„ 6—Heckland's Wheat	10 58
„ 7—Red Essex	9 59
„ 8—Smooth-eared Red	9 61
„ 9—Blood Red	7 58
„ 10—Selected in Edinburgh Market, being a good sample of Hunter's	8 61

I sent a bushel of each to be manufactured into flour, and obtained the following return:—

No.	Weight of each Bushel of Wheat.	Produce in Fine flour.	Produce in Third Flour.	Produce in Bran.	Total produce. Fine Flour. Third Flour. Bran.
	st. lbs.	st. lbs.	st. lbs.	st. lbs.	st. lbs.
1	4 3	3 1	0 4½	0 10½	4 2
2	4 3	3 2	0 4	0 9½	4 1½
3	4 4	3 1	0 5½	0 10½	4 3
4	4 3	2 12½	0 4½	0 13	4 2
5	4 1½	2 12½	0 4	0 11½	3 13½
6	4 1	2 11½	0 5	0 11½	4 0
7	4 2	3 0	0 4	0 11	4 1
8	4 3½	3 1	0 4½	0 11	4 2½
9	4 0½	2 12	0 5½	0 10½	3 13½
10	4 4½	3 2½	0 4½	0 10½	4 3½

From the foregoing table—first, as regards the acreable produce—the four most productive varieties stand thus:—

1. Heckland's. 2. Smooth-eared Red Wheat. 3. Red Essex. 4. Hunter's.

But, then, as regards the weight per bushel, and productiveness in flour, their position is reverse, viz.:—

1. Hunter's. 2. Smooth-eared. 3. Red Essex. 4. Heckland's.

If satisfied with that experiment, one might have been able to conclude that the succeeding year they were safe in sowing Heckland's, the Smooth-eared, or Red Essex, in preference to Hunter's; but I found each successive year prove the contrary, and that, upon an average of seasons, Hunter's gave the most profitable crop. My idea, whether right or wrong, was, that the late period of the season, when the different kinds were sown, gave, in that particular one, the balance in favour of those that proved most prolific. My impression is, that in a very late season some English variety will suit best; but when the seed-time can be got over by the month of November, a Scotch variety is fully more to be relied upon for general sowing in Scotland. For many years, therefore, I kept by Hunter's, as the most remunerative on my farm. I afterwards became acquainted with the merits of the Hopetoun, and ultimately found it to be even preferable to Hunter's Wheat, as it gave more straw, and fully as much produce in grain, and evidently of as good quality. In 1845 I made another comparative trial with the following, and the order in which I now state them were their productiveness:—

1. Fenton. 2. Taunton Dean. 3. Red Wheat. 4. Hopetoun. 5. Pearl. 6. A mixture of them all. 7. Chiddam. 8. A white Wheat recently introduced from England, and much recommended.

The soil upon which this experiment was made was rather of a loamy character, and very liable to give over-luxuriance in straw. After years, however, brought me to the following conclusion:—That, except upon the land upon my farm liable to lodge, Hopetoun—on an average of years—was most remunerative; but the Fenton better suited where the soil was likely to cause the crop to run much to straw. I have repeatedly sown the Red-chaff, Red-straw, and many others, which have been found to answer well on other farms; but in the meantime I am disposed to adhere to the two kinds I have referred to. The portion of my farm where Wheat may be cultivated varies from 450 to 600 feet above the level of the sea, and the soil upon it, generally speaking, of medium quality.

The next point embraced in this day's discussion is the quantity of seed necessary to sow. This must be regulated entirely according to the nature of the soil, climate, season of the year when sown, and condition of the land, and may vary, according to circumstances, from 6 pecks to 16 pecks per Scotch acre. I have found, upon my farm, if sown broadcast, 3 bushels, or 12 pecks—if the seed time happens in the end of September, or in the month of October—is equivalent to 4 bushels in those of November and December; and that old Wheat admits of being sown much thinner than new, and, when drilled, less is required than when sown broadcast, and that summer fallow land will do with a half less than after Potatoes, Beans, or Turnips; and the very condition of the grain affects the quantity that ought to be sown. In short, no specific quantity can well be stated; it is one of those parts of farm management which must be determined by the skill and observation of the agriculturist. The last point I would touch upon is the comparative advantages of drilling, dibbling, or sowing broadcast. I would therefore say, on all land having a large proportion of clay, or even with a moderate proportion, and when the furrow after the last ploughing leaves a sufficien bed and covering for the seed, nothing will succeed better than by sowing broadcast. On the other hand, when the land is so loose as not to leave a well raised up furrow for the seed, drilling is the next best to adopt, and if, as sometimes happens, continued rains prevent the drilling machine from working properly, the land may be ribbed by the common paring plough, or by a machine for the purpose, or even the seed ploughed in by a light furrow. The pressure now in use which follows three ploughs forming a bed for the seed, is a good preparation, but then in rainy weather that operation can be but imperfectly performed. In short, it just comes to this, the farmer is the creature of circumstances, his knowledge must be acquired in the field, and must either adopt one or other of these operations, keeping in view, in the first place, to deposit the seed at a sufficient depth, and secondly to consolidate the light land as much as possible.

Mr. Walker Rannie, jun., Inchyra, sent the following paper:

The varieties of white Wheat chiefly grown in the Carse of Gowrie are the Red-chaffed, Uxbridge, Hunter, Hopetoun, and Fenton. I might enumerate several additional kinds, occasionally introduced from England, such as the Talavera, Chiddam, &c.; these, however, after a few years' trial, have been generally abandoned as unsuited to our climate. The Red-chaffed is a very fine Wheat, and is best suited for land which throws up much straw; its defects are want of bulk for the generality of soils, getting thin on the ground towards harvest, susceptibility of injury from shake, and a liability to blight in certain seasons. The Uxbridge produces a fine sample, and plenty of straw; it has been grown here for several years and continues to give satisfaction. The Hunter Wheat was long held in estimation, being not only hardy but fine in quality, and well-liked by bakers; it is now in great measure discontinued, its place being taken by varieties considered more productive. Of all the varieties I have enumerated, the Hopetoun and Fenton are at present most in repute. The Hopetoun produces a good sample and plenty of straw, and, in this latter respect, is superior to the others. However, from its being subject to the attacks of the fly, it does not often realise, on being threshed out, the expectations which its bulk, when growing, would indicate. My experience at present would clearly give the preference to the Fenton Wheat, as being better adapted than any of the others to this district, where want of straw is not a usual complaint; from repeated comparative trials I should say that it exceeds the Hopetoun in produce by 1 quarter per acre—the reason of its superior grain-producing property is, that it seems to be more capable of resisting the depredations of the fly, which frequently does immense injury. I have heard it remarked that in the Fenton Wheat a shorter time elapses between the bursting of the ear, and the period of its being full shot, than in the other kinds, and consequently that the fly has not the same opportunity of doing hurt. Red Wheats are not extensively grown here. I have lately introduced Spalding Red, and find it very prolific both as to straw and grain, and well suited for secondary land. The bearded variety, known by the name of April Wheat, I am in the custom of growing; its early ripening habits cause it in many cases to be substituted for a Barley crop. It succeeds best when sown about the middle of April. The proper quantities of seed is a subject upon which a great variety of opinion exists. Believing, as I do, that we err in sowing too thick, I sow my fallow with two bushels, and Wheat after crop, with three bushels per Scotch acre, and these quantities I find sufficient, if the land is drained and in good condition. I consider the best time for sowing fallow Wheat to be from the 18th till the end of September, and Wheat after crop, during the whole of the following month. It is rarely that Wheat can be advantageously sown after October, unless upon very dry soils. The dibbling of Wheat is unknown in this district, neither has drilling hitherto been much practised—the broadcast system being almost universal. As I grow Wheat on a considerable extent of light dry loam, I am in the habit of using an implement called a presser, which follows the ploughs when ploughing the seed furrow, and makes a rut of from 4 to 5 inches in depth between each furrow slice; this I find to be an excellent plan, as it insures the seed being put in at an equal depth, and prevents any being lost. It also consolidates the land, and to a certain degree counteracts the injurious action of the frost and sun, in throwing out the young plants during spring. In short, I consider that this method, when carefully gone about, is little inferior to the drill.—**Mr. Dickson, Saughton Mains, said:** My practice is to sow my Wheat in the months of October and November. The quantity of seed I sow is from 2 to 2½ bushels per imperial acre, commencing with 2 bushels, and, as it gets later in the season, increasing the quantity to 2½ bushels; it is all put in with the drill machine, which I consider much the best mode of sowing Wheat. Indeed, I am surprised that there should be any difference of opinion on this subject, as the drill places the Wheat in the precise position and depth that the sower chooses. I can easily understand that there may be a difference of opinion in regard to the distance between the drills; but this can also be regulated to any width that may be desired. I consider broadcast sowing a great waste of seed, and an unsatisfactory mode of sowing, one portion of the seed being left on the surface, and another portion buried too deep; so that the braird comes up unequally. Next to drilling, I approve of the use of the presser before sowing, which leaves an equal depth of seed-bed for the Wheat; but the presser is attended with this disadvantage, that the Wheat so sown cannot be hoed in spring, which I hold to be of the greatest importance to the successful cultivation of the Wheat crop. I believe every farmer has observed the great advantage which any autumn-sown or planted garden crop derives from the first spring hoeing; for instance, early Cabbages: and he can easily understand that autumn-sown Wheat, being placed in similar circumstances, will be equally benefited. The hoeing of Wheat is very generally practised in many counties of England, but to a very limited extent in Scotland; and having practised it myself for several years, and found my crop greatly improved by it, I would impress on others the propriety of giving it a fair trial, and I have not the least doubt they will find the same result as myself.

Review.

Opinions on Practical Agriculture in the Hundred of Wirral, Cheshire. By the Wirral Agricultural Improvement Society. J. Cross, Stamp Office, Birkenhead.

This is an interesting and useful pamphlet. It contains the resolutions and conclusions of a Farmer's Club on such subjects as Draining, Fencing, Rotations of Crops, Manure, Autumn Seedings, Storing of Roots, Cattle Feeding, Milch Cows, Horses, Farm Servants, Spring Seeding, Clover and Grass Seeding, Root Crops, Hay-making, Harvest, Implements, and Farm Accounts. What could be a better table of contents for an agricultural work? And the different topics are clearly and intelligently discussed, so that the whole performance is one which, while it reflects great credit on the district whose practice it criticises or describes, is at the same time well calculated to benefit readers in other parts of the country. We select a passage appropriate to the present season.

Autumn Seeding.—"Wheat is allowed by all farmers to be their staple product, and in this district it is, in

conjunction with the proceeds of the dairy, their sheet-anchor; and the best means of getting a large quantity of it should be their constant study, for nothing can make up on a farm for the failure of this valuable crop; therefore we propose to review shortly the different preparations for it.

"There is no doubt that on suitable land the best preparation for Wheat is Potatoes [This, however, is an opinion which, in many other parts of the country, will be stoutly disputed]; one great benefit derived from this crop is, that it effectually cleans the ground when properly attended to, which is one of the greatest objects to be attained in good husbandry. But as only a small part of the land intended for Wheat can, under the most favourable circumstances, be planted with this root, and by its great failure of late years, that quantity is considerably reduced, it is, therefore, necessary to consider what are the other preparations best suited for it; and before we enter into that, it is as well to state that there is in the Hundred a small portion of light land, every acre of which should always be covered with crops of some kind; and roots of every description are excellent, and the best preparations for Wheat. But the greater part of the district consists of heavy land, and the Society does not consider it by any means a settled question, that it is advantageous to grow on such land a great breadth of Turnips, though a most valuable root, and a very good preparation for Wheat in some seasons, and after which it is frequently sown, and advisedly so; but the low price of grain for cattle-feeding, caused by "free-trade," makes it doubtful whether it is not better to buy some of it for them, rather than grow so many Turnips. Indeed, so far, the conclusion is unavoidable, that on the wet and undrained land, and occasionally on the drained portion when it becomes dirty, the most economical and only sure plan is to have a naked fallow; which, in such cases, is the best preparation for Wheat. To do this, the land should be broken up to the full depth you intend to go, immediately after Wheat sowing is finished, or as early in the autumn as you can, ploughed into small butts to expose plenty of surface, and keep the land dry; and as the great object of this expensive process is to clean the land, no opportunity should be lost of working it well through the summer, when the weather is hot and dry.

"Lea Wheat having had several trials in the neighbourhood, and the majority of cases having proved a failure, it cannot be recommended as a general practice; but when it is tried, a dressing of lime, or about three loads of gas lime, or four bushels of common salt, ploughed in per statute acre, will have the best effect; and if sown upon one furrow, it ought to be run over with a land-presser, drawn by one strong horse, and following two ploughs; but, as a general rule, a summer's fallow, a crop of Beans, Vetches, or root crop, should follow a ley before Wheat is sown.

"Wheat will answer well after Beans, provided the land is clean, but otherwise it ought not to be sown; it will also answer very well on heavy land, after Vetches, which in many cases is a better preparation than Turnips, as the land can be cleaned after they are mown, and the Wheat put in, in good time.

"When Wheat is sown after fallow on wet undrained land, and there is any quantity to be done, it is best to begin the end of September, or beginning of October, as it is seldom the weather will allow you to continue long without hindrance. Many prefer ploughing Wheat in on a fallow, and all think it should be put in as soon after it is ploughed as possible; but this cannot be done always; and when such is the case, it has been found best to leave two rounds in every rein [What is a rein?] unploughed till the day the Wheat is sown; if wet weather intervenes between the ploughing and seeding, the reins get into very bad condition, and cannot be worked so early by some days as when left unploughed, neither will it cover the seed so well; this applies to other land equally as much as fallows. All Wheat on heavy land should be in, if possible, by the end of November; if any remains undone after the middle of December, it had much better be left till February, as great risk is run by sowing it in the middle of winter, and nothing as regards time in its growth is gained by it. On light land it is not so particular; but even on that, February is a better month than January.

"Change of seed every year from a different part of the country is strongly advised; long experience has proved the benefit of it, and a strong illustration of the case occurred to one of the members of this Society last season. He sowed some Wheat the second year only in a field of his, and, by its side, a sack of exactly the same description of Wheat, originally from the same stock, but fresh from a distance that year, and the difference in favour of the crop from the sack of new Wheat was very remarkable, and convincing that a yearly change is beneficial.

"With regard to the best kinds of Wheat for the district, and, at the same time, to suit the markets, the best yet found out for profit are, for rich land the Waterloo white Wheat, and Spalding's Prolific, a red kind, for the poorer descriptions. The quantities of seed must vary very much with circumstances; there is no doubt that less seed than is usually sown would sometimes answer, but Wheat is a crop the farmer cannot afford to run unnecessary risk with, and the Society does not advise much under two measures for the earliest, and more than that for the latest sown.

"Drilling has answered very well where it has been tried, the rows at about seven inches apart, and on light land it secures a better root than broadcast; it requires less seed, and sows it very regularly. Ribbing is a system approved by some, but it has not yet been much tried."

Calendar of Operations.

OCTOBER.

AN ESSEX FARM, *Oct.* 21.—The horses have been employed this last week ploughing up Bean land for Wheat, and it does beautifully. We have sown a few acres of slit land (that is, summer fallowed), and no land could dress better; it looks more like a garden bed than a ploughed field. Wheat sowing is now becoming general in this part, except with some old practical men, who say that Wheat will not do well unless the land is pasty, and turns over in ploughing, just like a brick when turned out of the mould. The fact is, that there is not a chance of putting Wheat in otherwise, one season out of twenty on the heavy land in this neighbourhood; therefore, as a man's life is but three score and ten, he cannot judge whether a good seed-bed is best for Wheat or not, and is apt to stick to his forefathers' prejudices. We have begun this week to take up Mangold; they are a much better crop than Turnips—I may say quite an average crop, and the Globes are much superior to the long red ones; this is so every year, according to my observation, and all cattle like them best; but neither one nor the other should be given to any breeding stock, more particularly sows, as they cause abortion. We have this year tried a new implement (Bentall's broadshare) to break up the stubble, and find it the best of anything we have seen for that purpose; with it no land need be foul, as you may begin directly after harvest, and go over most of your stubble in a few weeks. It does 4 acres a day, with three horses. This gives the annual weeds a chance to vegetate before winter, and you the chance to kill them, and prevent their spoiling your crop next year. *E. X., near Braintree, Essex.*

Notices to Correspondents.

ACCOUNTS: *E F.* We have published your question in the Home Correspondence section of the Paper.

BEANS: *Constant Reader.* We should prefer Beans with a little Linseed to anything else. And Beans alone, with Turnips, for sheep, we should prefer to oilcake.

BLACK BARLEY: *J P.* Sow early in spring—*i. e.*, late in February.

BOOKS: *London Cowfeeder.* The best works on diseases of the cow are "White Cattle Medicine," latest edition, and "Cattle," by Wm. Youatt. *W. C. S.*

DRAINS: *R G Thomas.* A flat tile, too large for the bottom of the drain, and tilted up against the side of it, will leave as permanent a conduit for the water beneath it as the mole-plough would, but not more so. Your pond into which the drains run must be kept dry, by having a pervious bottom, or by artificial means, such as a windmill, and perhaps a steam-engine, or it will not act.

GRASS SEEDS: *Tiverton.* You had better sow them with a thin seeding of Barley—not with Rape, to be eaten down with sheep. The best Carrots ever we grew were from 3 cwt. per acre of Peruvian guano, sown broadcast on land which had been sown with Italian Rye-grass in the previous corn crop, and dug in in February. Sow the manure a fortnight before the seed—the latter to be drilled on the flat in rows 18 inches apart.

KOHL RABI: *Old Subscriber.* You may leave them in the land, and pull them as wanted.

MR. RIGDEN'S FARM: *A Canny Scot.* Your letter shall appear next week, with Mr. Wilson's admirable critique on Mr. Milner's pamphlet.

NOISE OF THRESHING MACHINE: *R G.* We are not learned in the law. A nuisance forms, we believe, good ground for an action for damages against its promoters; but what the legal definition of a nuisance is we do not know.

SOOT AND SALT: *Curate.* Thirty bushels of soot and 2 cwt. of salt is a good dressing for an acre, *i. e.*, about 3 or 4 oz. of the former and less than 1 oz. of the latter per square yard.

WEIGHT OF ROOTS: *L B S.* A ton of Mangold Wurzel will probably weigh 19, 18, and 16 cwt. in March, April, and May of next spring, respectively. Both Swedes and Mangold Wurzel grow now as rapidly as at any time; but we have had all ours (1500 tons) harvested already; because the risk of injuring the land by hauling in wet weather is too great. About Turkeys next week.

Markets.

COVENT GARDEN, Nov. 2.

Vegetables are abundantly supplied, and Hothouse Grapes and Pine-apples are plentiful. Melting Peaches are over, but some Michaelmas ones may still be had. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent, but the former less plentifully. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, and Roses.

FRUITS.

Pine-apples, per lb., 3s to 5s	Oranges, per doz., 2s to 3s
Grapes, hothouse, p. lb., 1s to 3s	— per 100, 8s to 24s
— Portugal, p. lb., 8d to 1s	Pommegranates, each, 3d to 6d
Peaches, per doz., 3s to 10s	Almonds, per peck, 6s
Melons, each, 1s to 3s	— sweet, per lb., 2s to 3s
Plums, p. punnet, 1s to 2s 6d	Walnuts, p. 100, 1s to 2s
Pears, per doz., 1s to 3s	— p. bush., 12s to 24s
— per half sieve, 6s to 15s	Nuts, Barcelona, p. bush., 20s to 22s
Apples, dessert, p. bsh, 3s 6d to 8s	— Brazil, p. bsh., 12s to 14s
— kitchen, do., 3s 6d to 6s	Filberts, per 100 lbs., 60s to 65s
Lemons, per doz., 1s to 2s	

VEGETABLES.

Scarlet Runners, p. half sieve, 1s to 1s 6d	Shallots, per lb., 6d to 8d
Brussels Sprouts, do., 1s to 1s 6d	Garlic, per lb., 4d to 8d

COAL MARKET.—FRIDAY, Nov. 1.

Eden Main, 15s. 6d.; West Hartley, 14s. 6d.; Wallsend Riddell, 15s.; Wallsend Haswell, 16s. 6d.; Wallsend Hetton, 14s.—Ships at market, 43.

SMITHFIELD, MONDAY, Oct. 28.

Although there is a considerable falling off in the supply of Beasts, the number is still large, and the demand small; consequently prices cannot be quoted on the average higher. A clearance cannot be effected of inferior qualities. The supply of Sheep is nearly as large as on Monday last; however, some of the choicest descriptions make rather more money. The number of Calves is quite adequate to the demand. Our foreign supply consists of 1391 Beasts, 5050 Sheep, 130 Calves, and 200 Pigs.

Per st. of 8 lbs.—s d s d		Per st. of 8 lbs.—s d s d

Ditto Shorn	— ...	Lambs	— ...
		Calves	2 4 — 3 6
		Pigs	2 8 — 4 0

Beasts, 4579; Sheep and Lambs, 25,450; Calves, 130; Pigs, 600.

FRIDAY, Nov. 1.

We have only a moderate supply of Beasts, but the demand is so small that it is difficult to dispose of any except the choicest kinds. The supply of Sheep is not large, but quite sufficient for the trade; indeed, on the average prices are lower. There are very few buyers for Calves; although the the number is small, prices are no better. The foreign supply consists of 477 Beasts, 1380 Sheep, 153 Calves, and 80 Pigs. The number of Milch Cows is 85.

Best Scots, Herefords, &c. ...	3 4 to 3 8	Best Long-wools .	3 4 to 3 6
Best Short-horns	3 2 — 3 6	Ditto Shorn	— ...

		Calves	2 4 — 3 6
		Pigs	2 6 — 3 8

Beasts, 962; Sheep and Lambs, 4390; Calves, 265; Pigs, 580.

HOPS.—FRIDAY, Nov. 1.

Messrs. PATTENDEN and SMITH report that the market is very firm, in consequence of the duty being likely to fall very considerably under the late estimate. It is now 220,000*l.* to 225,000*l.*

POTATOES.—SOUTHWARK, Oct. 28.

The Committee report that the arrivals coastwise during the past week have been very limited, but we are so well supplied by rail, that it is with difficulty the following prices are obtained:—York Regents, per ton, 70s. to 80s.; Perth do., 60s. to 65s.; Fifeshire do., 55s. to 60s.; Wisbeach and Cambridgeshire do., 60s. to 65s; foreign whites, 50s. to 55s.

MARK LANE.

MONDAY, OCT. 28.—The supply of English Wheat by land-carriage samples this morning was small, which enabled factors to realise it on the terms of last week. Foreign was in moderate demand only, but we observe no alteration in its value.—Fine English and foreign Barley maintains our quotations.—Beans must be written 1s., and Peas of all sorts 1s. to 2s. per qr. cheaper.—The Oat trade is not brisk; old English and foreign support last week's rates; new Irish, however, must be written 6d. to 1s. per qr. lower.

FRIDAY, Nov. 1.—The arrivals of English corn since Monday have been moderate, but we continue well supplied with foreign, particularly Wheat, and the attendance at market being small, it was difficult to clear these cargoes without a slight decline.—Fine malting Barley is in great request, and commands extreme prices.—Beans are unaltered in value.—There is a heavy sale for white Peas, and soft Danish are purchaseable at 27s. to 28s. per qr.—The Oat trade is firm, and prices unaltered.—Flour is rather a sluggish sale, but without alteration in price.

LIVERPOOL, FRIDAY, OCT. 25.—At our market to-day English and foreign Wheat of all descriptions met an extremely slow demand, only a few parcels having been disposed of, and those on rather easier terms. Irish new Wheat being scarce, remained unaltered in value. All kinds of American Flour are in fair request to-day, at the full rates of Tuesday last. French Flour goes off freely at full prices. Barley, Beans, and Peas having been taken sparingly to-day, were the turn cheaper. In Malt no variation. Oats and Oatmeal, upon a moderate demand, maintained our last currency. Although we had less business doing in Indian Corn than before, holders were firm at our last quotations.——TUESDAY, OCT. 29.—Notwithstanding the extent of our supplies, which are very large, the trade has shown tolerable steadiness during the week, and very little variation has occurred in the quotations. There was a thin attendance at our market this morning, and the trade was dull throughout. No alteration was made in the value of Wheat, or of any article. The best feature in the trade's favour was the little disposition to sell Flour, after so large an arrival, by taking lower rates; it is mostly going into store.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes of various sizes. In all cases, unless the whole box is taken of either size, extra must be charged as specified.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street Without, London.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

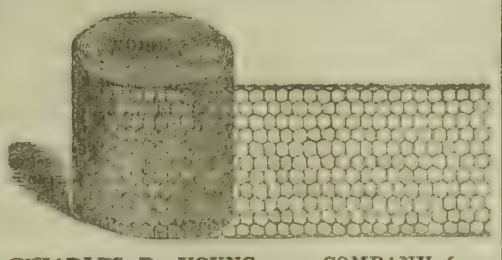
THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash: Good substantial built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l.*; 21 feet long, 13 feet wide, 50*l.*; 12½ feet long, 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, iron Handlights, Summer-houses, Seats, &c. Estimates for any branch in the above line, either in wood or iron, or for park fencing.

DR. S. NEWINGTON'S IMPLEMENTS OF AGRICULTURE.—These Implements have been invented to introduce an improved system of cultivation, and a more scientific method of depositing the seed. A Prospectus and Lecture on the different methods may be obtained (gratis) by applying to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red Lion-square, London.



LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.

This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament.

Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

PLOUGHING SEASON.—THE TWO GUINEA PLOUGH! Cheapest in the world. Made to suit the times. Warranted. The Wedlake Chaff-cutter, surpassed by none; warranted to stand 20 years and upwards. The Grass Mowing Machine; the New Dibbler, outdoing all others; the Metallic Churn and American ditto. Very liberal discount for cash to meet the times.—118, Fenchurch-street, Mark-lane. Actual manufacturers.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,

22, PARLIAMENT STREET, WESTMINSTER, LONDON;

48, NORTH BRIDGE, EDINBURGH;

32, ST. ENOCH SQUARE, GLASGOW;

1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

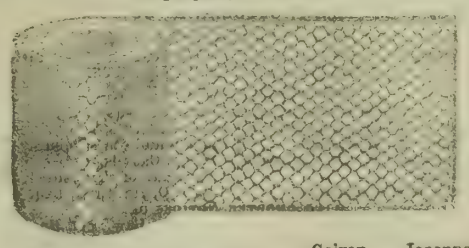
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

YARMOUTH BLOATERS.—GENUINE AND OF THE FINEST QUALITY.

Yarmouth has for centuries been justly celebrated for its well-known "Yarmouth Bloaters," the delicacy of which, when obtained in their genuine state, requires no comment. Such an opportunity is now offered; and they can be forwarded to any part of the kingdom (on receipt of a post-office order), at 10*s.* per 100, or 6*s.* per 50 (package included).—All orders to be addressed to Mr. FREDERICK BROUGHTON YOUELL, Church-square, Great Yarmouth.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine-comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

CAUTION.

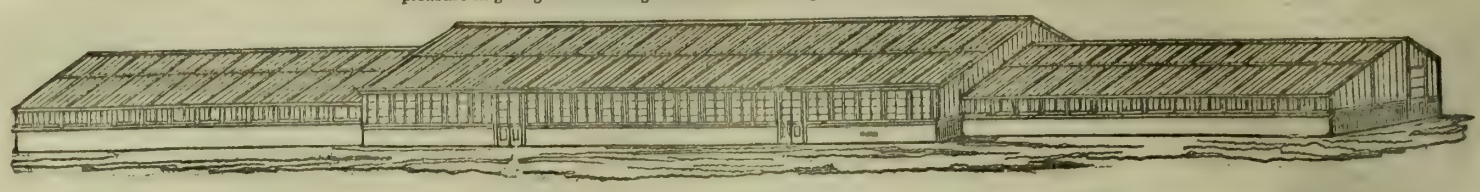
NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped 'Clarke's Patent," is that recommended for the Albert Lights.

PRICE'S PATENT CANDLE COMPANY, Belmont, Vauxhall.

THE SECRET ART OF DISCOVERING CHARACTER FROM HANDWRITING is still practised by MR. ELLISON with astonishing success. His startling revelations of the mental and moral qualities, talents, and defects of his applicants fills the four pages of a sheet of paper, the style of description differing from anything yet attempted. Test this by sending any specimen of the writing of yourself or of those in whom you are interested (inclosing 15 postage stamps), addressed to Mr. ELLISON, Professor of Graphiology, 151, Strand, London.



FRY AND ALSOP'S IMPROVED SULPHURATOR and FUMIGATOR.—A Portable Machine for Diffusing Sulphur amongst Plants affected with Mildew, such as Vines, Wall-trees, Heaths, Peas, &c. This Machine has been improved by F. and A. making it less complicated and more perfectly effective, and they flatter themselves that nothing can be brought into notice to compete with it for usefulness and simplicity of construction. Extract.—"No garden can be complete in its arrangements without it."—*Gardener's Magazine of Botany and Florists' Guide*, Oct. 1850. Orders sent for the above to FRY and ALSOP, Lee, Kent, will meet with prompt attention. Manufactured also for agricultural purposes.—Nov. 2.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR; an extraordinary, powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be, produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles, Powerful Telescopes, Opera and Race Glasses; also a curious, very small, powerful Waistcoat Pocket Glass, only the size of a Walnut, to discern objects at the distance of four or five miles.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartholomew-lane, Bank, on THURSDAY, November 7th, and following day, at 12 o'clock each day, a first class collection of DUTCH BULBS, consisting of the finest double and single Hyacinths, Narcissus, Jonquils, Crocus, Tulips, Ranunculuses, Anemones, &c.; with an assortment of Standard and Dwarf Roses, comprising Hybrid Perpetuals, Bourbons, Chinas, &c.; selected American Plants, and Ornamental Trees.—May be viewed the morning of sale Catalogues may be had at the Auction Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

PLANTING SEASON.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. J. Smith to offer to public Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, November 11th, and three following days, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of very fine Evergreens; Fruit Trees, comprising all the acknowledged and approved varieties, Ornamental and Forest Trees, Deciduous Shrubs, &c.—May be viewed prior to the sale. Catalogues may be had (6*d.* each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORNSEY ROAD.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. W. J. Pamplin to submit to public competition by Auction, on the premises, Paradise Nursery, Hornsey-road, Islington, on MONDAY, November 18th, and following day, a part of the valuable NURSERY STOCK, comprising fine Evergreens, &c.; also choice Greenhouse Plants, consisting of Double Camellias, beautifully set with bloom buds, 18 inches to 6 feet, Azalea indica, Epacris, Ericas of all the leading varieties, Chrysanthemums, &c.—May be viewed prior to the sale; Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The Nursery to be Let, with immediate possession. The remaining Stock may be taken at valuation, if required.

CAMELLIAS, AZALEAS, HEATHS, AND OTHER GREENHOUSE PLANTS OF LARGE SIZE, 450 STANDARD ROSES, DIELYTRA SPECTABILIS, AND A CASE OF BULBS FROM ALGOA BAY, &c.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, 8th November, at 12 for 1 o'clock, SPECIMEN PLANTS of a Gentleman who is giving up growing for Exhibition, consisting of Camellias, some handsome double Whites of very large size and well set with bloom, and other favourite varieties; fine specimen Heaths of the best sorts, Azaleas, Acacias, Corræas, &c.; also 450 Standard Roses, chiefly autumnal flowering varieties, &c. &c.—May be viewed on the day prior and morning of Sale, and Catalogues had.

POOLE NURSERY, 1 mile from Poole, on the Parkstone-road.
IMPORTANT SALE OF NURSERY STOCK.

MR. NICHOLL has received instructions to sell by Auction, on the ground, the whole of the Stock of Evergreens, Ornamental and Flowering Shrubs, Fruit and Forest Trees, without the least reserve, on THURSDAY, November 7th, 1850. The Stock of Shrubs comprises Laurels, Arbor-vitæ, Red Cedar, Evergreen and Scarlet Oaks, Berberis, Hemlock, Spruce, Azaleas, Ericas, Box, Roses, Dwarf and Standard, &c. The Forest Trees are about 20,000 Oaks, 3 to 6 feet high, 10,000 Scotch, 20,000 Spruce, 500,000 four-year old strong Quick Thorns, Elms, Beech, Birch, Acacia, and Hornbeams; a fine collection of Pinus, &c. The Fruit Trees are Filbert, Apple, Pear, Plum, and Cherry. The above will be found particularly worthy the attention of gentlemen planting; as the whole stock is beautifully grown, with a large mass of fibrous roots, and the soil of the Poole Nursery being remarkably light and poor, the trees are sure to thrive luxuriantly when removed. Sale to commence at 12 for 1 o'clock precisely. As it is intended if possible to sell the whole in one day, punctuality is respectfully solicited. Catalogues sent on application to the Auctioneer, Poole, upon enclosing two penny stamps for the payment of postage.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

SUNNINGDALE AMERICAN NURSERY, near Sunninghill, Berks, two miles from Virginia Water, two miles from Sunninghill Wells, and half a mile from Shrub's Hill.

MR. WATERER will Sell by Auction, on MONDAY, November 4, 1850, and following days, at 11 for 12 o'clock precisely, part of the extensive and valuable NURSERY STOCK of Mr. James Walker; consisting of 25,000 blooming Rhododendrons; Kalmias and Azaleas for Forcing, and many large ornamental Plants; a large quantity of Choice Evergreens and Flowering Shrubs, Dwarf Roses, and Honeysuckles, Standard and Dwarf-trained Apples, Pears, Cherries, Plums, Peaches, Apricots, and Nectarines, of the most approved sorts, Common and Portugal Laurels of all sizes, Birch, Ash, and Oak, Purple and Common Beech, Spruce, Larch, Scotch and Balm of Gilead Firs, of all sizes, a large quantity of Quick, from 3 to 5 years old, and a great variety of other Nursery Stock, well worth the attention of Nurserymen and others, about planting, being in a safe moving condition. N.B.—The above is the produce of Seven Acres, and will be sold without reserve, as the Lease expires at Midsummer, 1851.—May be viewed one week previous to the Sale, and Catalogues had on the premises; of Mr. Charlwood, Seedsman, Covent-garden; and of Mr. Waterer, Auctioneer, Chertsey, Surrey, who will forward them on application, by post, enclosing six postage-stamps.

FIRST ANNUAL SALE OF ROSES, GROWN AT THE SOUTH ESSEX NURSERIES.

MR. HASLAM begs to announce, that on FRIDAY next, November 8, he will Sell by Auction, at the Mart, a large collection of ROSES, Standard and Dwarf, in the best varieties of Bourbon, Hybrid Perpetual, Hybrid China, Moss, Noisette, &c. Also 15 fine specimens of 8 feet Weepers, comprising Sempervirens, Ayrshire, Boursalts, and Noisettes. Climbing ditto, in pots for pillars, trellises, &c., warranted true to name, and minutely described in Catalogues, to be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping. Also at the same time about 100 fine Double Camellias, and a few Dutch Bulbs, of the most popular varieties.

HAMMERSMITH.
TO HORTICULTURISTS AND FLORISTS.

TO BE LET, on Lease, with immediate possession, a well-stocked and very eligible GARDEN GROUND, consisting of upwards of 2 acres, enclosed with high walls, abutting on the high road, at Hammersmith, with a convenient Cottage and small Shop, Greenhouses, Forcing Frames, &c., well adapted in every respect for an active Market-gardener and Florist. Further particulars and to view apply to Mr. Gomme, Auctioneer and Surveyor, Hammersmith.

Johnson, Esq., Editor of "The Cottage Gardener" and "Cottage Gardeners' Dictionary," aided by some of the best Gardeners of the day, will be Published, as usual, on the 21st of November, by the Stationers' Company, Stationers' Hall, London.

ENGINEERING SCHOOL CLASS-BOOKS.
In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.

By W. D. Cooley, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.

"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*

"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*

"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*

"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

Whittaker and Co., London.

FAMILIAR ASTRONOMY.—By George Darley, A.B., 12mo, with Engravings, 5*s.* cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its editor, Mr. Darley."—*Sun.*

Lately published,

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

A SYSTEM OF POPULAR ALGEBRA, with a Section on Propositions and Progressions. By George Darley, A.B. Third Edition. 4*s.* 6*d.*

A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical; with Popular Treatises on Logarithms, and the application of Algebra to Geometry. By George Darley, A.B. Second Edition. 3*s.* 6*d.*, cloth.

A SYSTEM OF POPULAR GEOMETRY; containing in a few lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By George Darley, A.B. 5th Edition. 4*s.* 6*d.* cloth.

COMPANION to the POPULAR GEOMETRY; in which the Elements of Abstract Science are familiarized, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. By George Darley, A.B. Second Edition. 4*s.* 6*d.* cloth.

EDWARD DENYER is now prepared to send out his new Descriptive CATALOGUE of Roses, Fruit Trees, Evergreens, Shrubs, Ornamental Trees, &c., which will be forwarded, by enclosing two penny stamps to his Nursery, Loughborough-road, Brixton. E. DENYER informs his friends that he has no Seed-shop in London.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Nov. 9.

MYATT'S LINNÆUS RHUBARB, strong roots, 12*s.* per dozen; Myatt's Victoria, 9*s.* per dozen; and Mitchell's Royal Albert, 12*s.* per dozen. Extra strong plants of the New Red Currant "Raby Castle," 6*s.* per dozen, or 45*s.* per 100; and Fastolff Raspberry, 10*s.* per 100. With the usual allowance to the Trade. Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, near London.—Nov. 9.

NOW SENDING OUT.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but often exhibited in our winning collections. The set may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

J. AND J. FAIRBAIRN having an immense Stock of remarkably fine FRUIT TREES, trained and untrained, consisting of Peaches, Nectarines, Apricots, Pears, Plums and Cherries, in a large assortment of the most approved kinds; also a very large stock of ornamental Forest Trees, Flowering Shrubs, and Evergreens, on land they are anxious to clear, are induced respectfully to solicit the attention of Gentlemen planting to an inspection of the same, which they intend to offer at such prices for cash as they hope will insure their liberal orders.

J. and J. F. also beg leave to solicit the attention of Gentlemen wishing to furnish Greenhouses, Conservatories, &c., to their stock of Cape Heaths, Epacrises, Chinese Azaleas, Boronias, &c., which is unusually large and fine this season, to which they will affix the most moderate prices, to induce the favour of extensive orders.

Nurseries, Clapham, near London, Nov. 9.

A FEW CHOICE LATE PEARS.

GANSEL'S LATE BERGAMOT, raised by Mr. Williams, of Pitmaston, bears well as a standard. Season, December. Young trees on the Pear stock 5*s.* each; double worked on the Quince. 7*s.* 6*d.*

WINTER BEURRE (Rivers's).—A new seedling from the Easter Beurré, quite hardy. Season, February and March. On Pear stocks, 5*s.*; double worked on the Quince, 7*s* 6*d.*

BERGAMOTTE D'ESPERIN.—Season, April and May. On Pear stocks, 2*s.* 6*d*; on Quince, fine pyramids, 3*s.* 6*d.*

BEURRE BRETONNEAU.—Season, May and June. On Pear stocks, 5*s*; on Quince, 5*s.*

DOYENNE GOUBAULT.—Season, March. On Pear stocks, 2*s.* 6*d.*; on Quince, fine pyramids, 3*s.* 6*d.*

SUSETTE DE BAVAY.—Season, March to May. On Pear stocks, 2*s.* 6*d.*; on Quince, fine pyramids, 3*s.* 6*d.*

JOSEPHINE DE MALINES.—Season, February to May. On Pear stocks, 2*s.* 6*d.*; on Quince, fine pyramids, 3*s.* 6*d.*

All the above are first-rate melting Pears, and bear well as pyramids.

CANES of the LARGE FRUITED MONTHLY RASPBERRY, now in full bearing, are this season sold at 4*s.* per dozen; 30*s.* per hundred.

THOMAS RIVERS, Nurseries, Sawbridgeworth, Herts.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH. ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., PLYMOUTH, *have a large SURPLUS STOCK of the following TREES and SHRUBS; and as the ground is required for other purposes, they will be sold at the following low prices:*

*** CARRIAGE FREE (See below.)

THORNS OR QUICK.—10,000 fine transplanted Thorns, from 12 to 15 inches high, for 3*l.* 10,000 one-year old Seedlings, at 1*s.* 6*d.* per 1000.

LARCH FIRS.—We have a very large stock of fine stuff, about 3 feet in height; the price will only be 18*s.* per 1000 if 5000 are taken.

WHITETHORN, twice transplanted (very strong), 7*s.* 6*d.* per 1000.
Do. 1 and 2 years transplanted, 4*s.* 6*d.* and 5*s.* 6*d.* per 1000.
Do. 4 years, strong and fine, with an abundance of fibrous roots, as good as transplanted, 3*s.* per 1000, or 12*l.* 10*s.* per 100,000.

Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots of the newest and most approved kinds, selected from the gardens of the London Horticultural Society, and warranted true to name, can be supplied in maiden and trained trees of the finest quality, and forward for bearing.

NEW SEEDLING PANSIES — "COMMANDER-IN-CHIEF" AND "PRINCE ARTHUR."

YOUELL and CO. beg to announce they are now prepared to execute orders for the above first-rate PANSIES, which they guarantee will give the highest satisfaction.

"COMMANDER-IN-CHIEF" was exhibited at the Worton Cottage Meeting of May 29th, under the initials of "T. T.," and the following opinion is given in "Beck's Florist" of July last: "No. 2, Yellow ground, bronzy purple top petals, lower ones margined with the same colour, bold eye, showing to great advantage: *a fine flower for Exhibition.*"

The following opinion of this fine flower is also given in the *Gardeners' Chronicle*, of June 20th, under the initials of "Y. Y." "No 2, Rich yellow ground, top petals dark maroon, lower petals margined with the same colour—eye good; a full-sized and fine flower."

"PRINCE ARTHUR," white ground, top petals rich dark purple, lower ones margined with the same colour, eye good—flowers large and of great substance.

This was exhibited with "Commander-in-Chief" at the Worton Cottage Meeting, and obtained the following opinion: "No 38, Style of Optimus, and a considerable improvement upon it, having more ground colour."

Strong plants of the above 5*s.* each, in pots, or per post free if required, and one over to the Trade when three are ordered.

THE FINEST CARNATIONS, PICOTEES, AND PINKS.

YOUELL and CO.'S Extensive and Celebrated Collection of the above are this season unusually strong and healthy, and are ready for sending out, in fine well-rooted plants, to any part of the United Kingdom, or for exportation, at the following prices:

25 pairs of finest first-rate show varieties of Carnations and Picotees	£5	0	0
12 pairs do. do. do.	2	10	0
25 pairs of very fine show varieties of do. do. ...	3	0	0
12 do. do. do. do. do. 1*l.* 4*s.* to	1	10	0
Fine mixed border ditto—per dozen pairs	0	12	0
True or Clove—per pair	0	2	0

PINKS, finest first-class show flowers, 12*s.* to 18*s.* per dozen pairs.

PANSIES, the finest first-class show flowers, comprising all those exhibited in the winning stands at the Metropolitan Exhibitions, 10*s.* to 18*s.* per dozen, per post free.

CAMELLIAS of the newest and best kinds, with flower buds, 30*s.* per dozen.

FANCY GERANIUMS, any of the following fine varieties, 12*s.* per dozen, viz.: Alboni, Anais, Statiaski, Yetmanianum grandiflorum, Jehu, Mazeppa Superb, Beauty of Winchester, Virgil, Delicata, Magnifica, Reine des Francais, Nosegay, and Decora.

CINERARIAS, best new kinds, 12*s.* to 18*s.* per dozen.

ERICAS, of the best autumn, winter, and spring-flowering kinds, 6*s.* to 9*s.* per dozen.

EPACRIS, ditto ditto, 9*s.* to 12*s.* per dozen.

CORRÆA speciosa major, Cooperii, bicolor, &c., in fine bushy plants, for winter flowering, 12*s.* per dozen.

MITRARIA COCCINEA, a splendid hardy shrub, with large scarlet flowers, fine bushy plants, 18*s.* per dozen.

ROSES, Standards, Half Standards, and Dwarfs, of the finest kinds in cultivation, 12*s.* to 15*s.* per dozen.

Royal Nursery, Great Yarmouth.

THE "BLACK NORFOLK TURKEY," and the "BLACK BOTANY BAY DUCK."—The Advertiser has for Sale a few pairs of the above, at 21*s.* per pair. The Turkeys are early birds of this season, and of the purest breed. The Botany Bay Ducks are very rare (quite as hardy as the common kinds), of a beautiful glossy jet black, the male birds having two or three white feathers on the breast. The flesh is far more delicate and superior to any of the genus. This species possess the extraordinary character of laying a majority of eggs perfectly black. Also one pair for Sale of a cross between this and the Aylesbury breed, being perfectly black, with conspicuous white breasts. Price 31*s.* 6*d.* the pair.

Orders, accompanied by post-office orders or reference, addressed to Isaac Brunning, North End, Great Yarmouth, will receive prompt attention.

TO SEEDSMEN AND FLORISTS.

ALFRED TOPF, Erfurt (Prussia), respectfully announces that his new Catalogue of German Flower and Miscellaneous other Seeds, is now ready, and may be had, postage-free, on application to H. Henkel, 24, Guildford-street, Russell-square, London.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 1*s.* each. Also Myatt's Linnæus, 1*s.*; and Victoria, 9*d.*; with usual allowance to the trade. Post-office orders are requested to be made payable to William Mitchell, Enfield Highway, Post-office, Enfield, Middlesex.

LATE SEEDLING GOOSEBERRY, "NEGRO BOY."

Two-year plants, 5*s.* each; one-year do., 3*s.* 6*d.*

JOHN WILLISON can supply the above splendid GOOSEBERRY, which has been tested by hundreds with the best varieties. Two dishes were shown at Whitby on the 24th Sept. last, for which an extra prize was awarded. The following extracts are selected from the editors' opinions.

Gardeners' Chronicle, Sept. 15, 1849.—"*J. W.* Late seedling Gooseberry, dark red, rich flavour, and would doubtless be good for preserving. It retained its flavour during carriage better than is generally found to be the case with Gooseberries."

Midland Florist for October.—"Willison's Negro Boy Gooseberry. We have this day (Sept. 18) received specimens of the above fruit; though not large, yet the lateness of its season renders it a valuable acquisition for the dessert. The specimens were perfectly smooth, of fine flavour, and a very dark colour; in fact, as they lay in the box, packed in cotton wool, they looked more like Damsons than Gooseberries."

Gardeners' and Farmers' Journal.—"*J. W.* We pronounce this winter Gooseberry excellent, and, for so late in the season, of an exquisite flavour."

STRAWBERRIES.—A few of the best varieties, viz., Cuthill's Black Prince, 10*s.* 6*d.* per 100; Kitley's Goliah, 10*s.* 6*d.*; Myatt's Eleanor, 5*s.*; British Queen, 3*s.* 6*d.*; Keens' Seedling, 3*s.*; Elton Pine, 3*s.*; Swainston do., 3*s.*

RHUBARB. — Victoria, 6*s.* per dozen; Royal Albert and Linnæus, 8*s.* per dozen.

The usual discount to the trade. All orders made payable to John Willison, Flowergate, Whitby.

TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES.

C. LODDIGES and SONS beg most respectfully to inform the above, that in consequence of the land upon which their celebrated Arboretum is planted being required for building purposes, they are determined to offer the STOCK at such a reduction in price (for cash only) as cannot fail to attract the attention of all who are engaged in extensive ornamental planting. The trees are of the finest description, and range from 6 to 10 feet high.

FIGS, in eight sorts	2	0	0

The above are of fine growth, and warranted true to name. A sample sent, if required; and Catalogue of sorts may be had by inclosing one penny stamp to John Bell, Nurseryman, Norwich.

Strong 4-year-old Whitethorn, and fine Beech, 1 to 2 feet, at 2*s.* 6*d.* per 1000, if taken in large quantities.

TO GENTLEMEN ENGAGED IN PLANTING.

ARTHUR MACKIE begs to call the attention of parties engaged in planting to the subjoined list of FOREST TREES, which will be found worthy of attention. The soil of the Nursery is a light loam, and well suited to produce fibres. The rate of carriage is very moderate by the Railway to London, Peterborough, Ipswich, and Colchester; and, in the case of large orders, a liberal allowance in Trees will be made to compensate for carriage.

The Nursery, Norwich.

GEORGE JACKMAN, Nurseryman, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

TO NOBLEMEN, GENTLEMEN, AND PLANTERS IN GENERAL.

WILLIAM YOUNG, Nurseryman and Contracting Planter, begs to inform persons engaged in Planting, that his extensive Stock of FOREST TREES, EVERGREENS, and HARDY ORNAMENTAL TREES and SHRUBS, is this season finer than it has been for many years past. The Forest Trees consist of strong bedded Alder, Ash, Beech, Birch, Spanish Chestnut, Hazel, Red-heart Willow, Scotch and Larch Firs, &c., all 2 to 3 and 3 to 4 feet high. A large quantity of English Oak, from 3 to 8 feet high, very fine.

The Evergreens comprise large Spruce, Silver, Weymouth, Scotch and Larch Firs, from 6 to 12 feet, well grown, and will remove with safety; common and Portugal Laurels, Green Hollies, American, Chinese, and Siberian Arbor-Vitæ; Pinus maritima, austriaca, and other Evergreens in great abundance. About 500 Quercus sessiliflora or Fir Oak, about 6 feet in the stem, with fine heads; will remove with safety; they are well adapted for avenues or park scenery.

Gentlemen planting new places or improving their estates will do well to apply to Mr. Y., as he has had considerable experience in planting in all its branches, and from the quantity of large Evergreens he grows is enabled to contract to any extent at a very reasonable rate.

Mr. Y. has also a very fine collection of Coniferous plants, from 2 to 4 feet, and large specimens, consisting of Cedars Deodara and Lebanon; Araucaria imbricata, Cryptomeria japonica, Taxodium sempervirens, Pinus insignis, Abies Douglasii, &c., of which he would invite a personal inspection.

His priced Catalogue is now ready, and can be had, on application, for two postage stamps.

An immense quantity of strong bedded Whitethorn or Quick for Fencing; and Mahonia aquifolium, or American Berberry, for cover, which will be sold cheap if taken in quantity.

Milford Nurseries, near Godalming, two miles from the Godalming Station of the South-Western Railway, where conveyances can always be obtained.

MUNRO TESTIMONIAL.—At a Meeting of the Committee, held on the 4th of November, for conducting the above Testimonial, it was resolved: "That the time for receiving Subscriptions be extended to the 1st of December, in order to afford all desirous of contributing an opportunity of doing so, when it will finally close." Post-office orders made payable at Turnham-green, to Mr. CHARLES EDMONDS, Chiswick House, Chiswick, Middlesex.

LARCH AND SCOTCH FIRS.

W. H. ROGERS has a quantity of the above to Dispose of, at a very moderate price. The Larch averages from 1½ to 2½ feet in height, and the Scotch 12 to 18 inches; both sorts are strongly grown and well rooted. Every other description of Nursery Stock can be supplied in large and small quantities, and low in price.

Address, W. H. ROGERS, Nurseryman, 130, High-street, Southampton.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE of CHOICE FLOWER ROOTS, SELECT ROSES AND SHRUBS, HARDY CLIMBING, AND HERBACEOUS PLANTS, PRIZE GOOSEBERRIES &c., sent by post on application. Our DUTCH BULBS have arrived in fine condition. The following selections are offered:

	s.	d.
HYACINTHS IMPORTED, with printed instructions, for pots, ground, or glasses, 50 varieties, in very choice assortment	35	0
25 do., 15s. to 25s.; 12 do. 6s. to	15	0
RANUNCULUSES, free by post, with printed instructions for culture: 100 roots in 100 very fine varieties, from superb seedlings and others ...	70	0
50 roots, in 50 superb seedling varieties	40	0
25 ditto 25 ditto ditto	22	6
50 ditto 50 fine varieties	15	0
Finest mixed, per 100, 10s.; fine mixed, 5s. (6s. free by post).		
ANEMONES.—100 superb named double varieties ...	34	0
50 ditto, 18s.; 25 ditto	10	0
Finest mixed, per 100, 10s. 6d.; fine mixed, per 100	7	6
Fine mixed, single, per lb.	4	0
GLADIOLI.—50 splendid early and late varieties ...	50	0
25 ditto, 30s.; 12 ditto	17	6
12 splendid early varieties, 10s. 6d.; 12 fine ditto ...	6	0
Fine mixed early hybrids, per dozen	3	0
Colvillii, 3s. 6d. per dozen; Colvilli rubrum, 7s. 6d. per dozen; C. superbum, 5s per dozen; Gandavensis, 5s. per dozen; Pscittacinus, 1s. 6d. per dozen; P. sanguineus, 7s. 6d. per dozen; Insignis, 18s. per dozen.		
EARLY TULIPS.—30 roots, in 30 fine varieties ...	10	0
60 roots, in 30 ditto, 18s; 90 roots, in 30 ditto ...	26	0
20 roots, in 20 fine varieties	7	0
40 ditto, in 20 ditto, 12s. 6d.; 60 ditto, in 20 ditto ...	17	0
Very fine mixed varieties, per dozen	2	0
DOUBLE TULIPS.—12 roots of 12 fine varieties ...	4	0
24 ditto, in 12 varieties, 7s. 6d.; 36 ditto, in 12 varieties	10	6
LATE TULIPS.—50 choice varieties, 50s.; 25 ditto ...	30	0
Finest mixed, 15s. per 100; fine mixed, per 100 ...	6	0
IRIS.—30 splendid English varieties	12	6
20 ditto, 9s.; 12 ditto	6	0
Very fine, without names, mixed, per 100	15	0
12 fine German varieties, 9s.; mixed, per doz. ...	5	0
CROCUS.—100 roots of each of 13 showy varieties ...	28	0
50 roots of each, 15s.; separate varieties, p. 100, 2s. to	3	0
NARCISSUS, JONQUILS, and all other roots in great variety, at low prices. (See Catalogue.)		

SELECT PLANTS.

HARDY HERBACEOUS PLANTS.—100 showy varieties	30	0
50 ditto, 17s. 6d.; 25 ditto, 10s. 6d.; 12 ditto ...	6	0
100 superior and new varieties	50	0
50 ditto, 30s.; 25 ditto, 17s. 6d.; 12 ditto	9	0
25 varieties, best adapted for rockwork, 12s.; 12 for	7	6
ANTIRRHINUMS.—12 fine and showy varieties ...	6	0
12 superior and new varieties (Wooller's, &c.) ...	10	0
CHRYSANTHEMUMS, fine plants for flowering.—12 splendid new varieties	15	0
60 best varieties, including the above	40	0
40 ditto, 30s.; 25 fine vars., 17s. 6d.; 12 ditto ...	9	0
CAMELLIAS.—12 fine varieties, well set with buds ...	30	0
INDIAN AZALEAS.—12 very fine varieties, 18s.; 6 do.	10	0
CAPE HEATHS.—12 fine early flowering varieties ...	12	0
HARDY AZALEAS.—12 splendid distinct varieties ...	15	0
Fine mixed, 9s. per doz.; large yellow, per doz. ...	9	0
ROSES in extensive variety. (See Catalogue.)		
PÆONIES.—Herbaceous varieties, mixed, per doz. ...	6	0
,, arborea papaveracea, each	2	6
RIBES.—6 fine flowering varieties	5	0
HARDY SHRUBS.—12 new and select varieties ...	15	0

Goods free to London, and, for long carriage, extra articles presented. Remittances requested from unknown correspondents. Post-office orders payable to STEPHEN BROWN, or to BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTS FOR BLOOMING IN THE CONSERVATORY IN WINTER OR EARLY SPRING.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge-road, Essex, beg to offer the following, finely set with bloom-buds, at the undermentioned moderate prices:

AZALEA INDICA, in fine sorts ...	18s. to 30s.	per doz.
EPACRIS and ERICAS, ditto ...	18s. to 24s.	,,
RHODODENDRONS, ditto	9s. to 18s.	,,
KALMIA LATIFOLIA...	12s. to 18s.	,,
HARDY AZALEAS, including fine Belgian varieties	9s. to 18s.	,,
MOSS AND PROVENCE ROSES ...	12s.	,,
LILACS, GUELDRE ROSES, DEUTZIAS, WEIGELA ROSEA, &c. ...	12s.	,,

The above are all beautifully grown, and well established in pots, and are fit for immediate forcing. Remittances respectfully requested from unknown correspondents.

CUTHILL'S "BLACK SPINE" and SNOW'S PRIZE CUCUMBERS at 1s. each packet; also his early Scarlet-flesh Melon, 1s. CUTHILL'S Pamphlet of 56 pages, containing the Belgian Prize Essay on the best way of producing Potatoes; with 12 more articles on fruits and vegetables, among which are Asparagus, Rhuburb, and Sea-kale. The pamphlet has been very favourably reviewed by Dr. Lindley and others. Price 2s., or by post, 2s. 4d. The trade supplied with the Cucumbers.—JAMES CUTHILL, Denmark-hill, Camberwell, London.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 9, 1850.

WE read in the *Athenæum*, that "At length the inhabitants of the south side of London are to have their PUBLIC PARK. The shooting grounds and premises, so well known as the Red House, nearly opposite to Chelsea Hospital, have been purchased by Government for, it is said, 11,000*l.*,—subject to the possession by the occupier of the grounds until the end of next year. Of the new bridge to be erected across the Thames in connexion with this park, the works are to be commenced immediately. The arches are to be of iron, like Vauxhall Bridge. By this way the distance from Kensington Gardens to Battersea Park will be little more than a mile and a half; and the densely populated district of Chelsea will lie between two of the amplest green spaces in London. The location of the new park on the river is a novelty and an advantage. The bank will no doubt be planted; and we shall thus secure at least one sylvan view from the decks of ascending and descending vessels in the midst of our thousand wharves and piers and warehouses of goods, as an inheritance of beauty to the people for ever." We wish it may not turn out an inheritance of ugliness, for we cannot but remember that similar expectations were entertained some years since, when Victoria Park was created; and we now perceive how they have been fulfilled.

Although well known to the inhabitants of Bethnal Green and Spitalfields, we suspect that few persons not living in those districts or their neighbourhood, have ever seen this Victoria Park. Had it been in the West-end of London, the manner in which it has been executed would have excited universal indignation; for although it has cost a very large sum of money, yet, as a specimen of English taste, it is a national disgrace. But the poor people, for whose use it is intended, are too thankful for an open space of any kind in which they can breathe freely, to be critical about its appearance. A few hundred acres of land, unencumbered by building, are in themselves a blessing, even though not a tree nor a blade of Grass be there.

We learn from the reports of the Commissioners of Woods and Forests, that the cost of Victoria-park, up to the end of last June, had been as under:

	Purchase of Site, &c.	Works of Formation.
Up to 1847... ...	£87,298 3 1	£30,521 0 0
In 1848... ...	——	10,034 13 0
In 1849... ...	——	3,194 3 5
In 1850... ...	577 9 1	319 1 0
	£87,875 12 2	£44,068 17 5

In round numbers the purchase of the ground has amounted to 88,000*l.*, and the cost of forming it into a park has been 44,000*l.* Upon the former we have no remarks to offer; but the latter calls for very serious comment. Forty-four thousand pounds is a large sum to expend upon 290 naked acres of land, and, under the most unfavourable circumstances, is capable of producing beautiful results. With such a fund the most level surface may be broken into picturesque forms, charming vistas may be produced, water may be lavishly introduced, even in Spitalfields thriving plantations may be rapidly established, and beautiful vegetation may in a few years be made to decorate the scene.

This is what the public expected when Victoria Park was formed, and ample means were voted by Parliament for the purpose; for it was intended that such an opportunity of showing what taste and skill can effect, in providing recreation and enjoyment for the poor, should be turned to the best account. It would appear, however, that anything was considered good enough for the east of London; and, accordingly, an image of deformity has been set up there to which, we suspect, there is no parallel in Europe. A park bearing the name of the QUEEN might surely have been expected to be an example of all that is graceful and exalted in landscape gardening; the persons employed by the Woods and Forests have spared no pains to render it mean and despicable, and they have succeeded perfectly.

Let the reader conceive an undulating space of 290 acres, entered by a lodge which can be compared to nothing better than a modern ruin built in some Cockney garden, of half vitrified bricks, and then made habitable by a country bricklayer. Having entered, let him imagine a road bending through the place till it finds its exit at the opposite side, another unfinished road, overgrown with Grass leading to the left, a few others curving in different directions; unmeaning masses of little miserable trees and shrubs, evidently the sweepings of some neglected nursery ground, and a great piece of water on the right, having in its middle an island looking more like an old naval cocked hat than anything we can call to mind, and he will have as good an idea of Victoria Park as we have the skill to convey. Beyond this there is nothing, except a frightful pagoda perched at one end of the frightful island, and the beginning of a foot bridge to connect that paradise with the mainland, which bridge consists of three or four rotten planks resting on struts, and impassable by anybody less surefooted than an Irish hodman. That is Victoria Park, that is what the country has paid 44,000*l.* for; that is what the inventive genius of the agents of the Woods and Forests has last offered to the public, as a sample of English landscape gardening. Ye shades of BROWN, of GILPIN, of REPTON, arise and denounce the perpetrators of this national offence!

With whom the blame may really rest, we know not; nor do we desire to inquire. The mischief is done, the money is spent, and, we suppose, we must rest content with our bargain. But if Victoria-park is ruined, there is still time to save that of Battersea. If Victoria-park has cost five times as much as would have been required to create a little paradise, the votes for Battersea have still to undergo the scrutiny of the House of Commons. As to the new cemeteries which are about to be formed, there is time also to rescue them from the fate of Victoria-park; and we most earnestly hope that Government will never again intrust these important works to persons who are not only wholly destitute of good taste, and profoundly ignorant of the nature of trees, or the soils to which they are adapted, or of the effects which they may be made to produce, but are even unacquainted with the mode of selecting them in nurseries, and of putting them into the ground; who seem, in short, to understand nothing except the art of obtaining the worst possible result at the largest possible expense.

THE French have obtained what they call a double bearing Elton Strawberry, concerning which we find the following account.

"Considerable interest has lately been excited amongst gardeners with respect to a new Strawberry, discovered by M. CRÉMONT, in the neighbourhood of Paris, and which, in addition to the other qualities which distinguish it from the form to which it belongs, possesses the property of bearing twice a year. It was discovered by M. CRÉMONT in a bed of seedling Elton Strawberries in the year 1847. The large quantity, beauty, and excellent quality of the fruit of this variety, induced the National Horticultural Society, to which it had been sent for inspection, to name a committee for the purpose of examining the plant with greater attention, and of ascertaining whether the advantages attributed to it by M. CRÉMONT had or had not any real existence.

"The committee, consisting of MM. CHÉREAU, ANGRAND, JAMIN, BARBOT, MILLERET, and ANDRY, accordingly proceeded to M. CRÉMONT's garden on the 4th of April last, and after seeing nearly 800 plants in pots, some in a Pine stove, others in the open ground under hand-glasses, unanimously declared that M. CRÉMONT's variety ought, for its early ripeness, beauty, and excellence, to be placed at the head of American Strawberries. The committee not having at that time any opportunity of confirming its double-bearing quality, revisited M. CRÉMONT's garden early in the following July, when they found the Strawberry still in full fructification. Several plants which had in April produced an abundant crop of fruit in the Pine stove had been placed out in borders, that their runners might be developed. Not only were these plants covered with fine ripe fruit and numerous flowers, but many of their early runners were bearing, and showed by their flowers and buds that they would do so for some time to come.

"The committee reported favourably of the Strawberry, and thought its discovery important enough to merit a special medal, which they have recommended to be awarded to M. CRÉMONT. In order, however, that all doubt may be removed as to the double-bearing property of this variety of the Elton Strawberry, 2 or 3 years of observation and experiment are still required. Those who wish to examine this subject for themselves can obtain plants from M. CRÉMONT, at Sarcelles, in the department of Seine et Oise, or more easily from M. COURTAIS-GERARD, seed merchant, 34, Quai de la Mégisserie, Paris."

Now the acquisition of a Strawberry of this kind is in itself worthy of notice; but what we more particularly desire to draw attention to is the manner in which our neighbours set about ascertaining whether a new fruit really deserves recommendation. The specimens, when exhibited, having attracted attention, what was done? a medal, or warranty of excellence, for it may be so called, immediately given them? Not at all; a committee is appointed to visit the Strawberry ground and verify the statements of the grower. The committee go to the ground, not once, but twice, and then again report in favour of the grower. Nevertheless French scruples are not satisfied, and it is declared that two or three years of observation and experiment are required to settle the true value of this fruit. All that the committee do, after all, amounts to a recommendation, not a declaration, in favour of the grower.

Is nothing of this sort practicable in Great Britain? Cannot we find some guard against the impositions which are daily practised under the name of novelty? We suspect that the countenances of some of our ingenious brethren would undergo rather con-

siderable change, if their seedlings, and inventions, and new things had to pass through such an ordeal. Circumstances and social habits would render some modification of the French Committee system necessary; but an approach might be made to it near enough to answer the more essential purposes.

GARDENS IN THE NORTH OF ENGLAND, SCOTLAND, AND IRELAND.

I SEND you a few observations on gardens, during a short excursion I made to the north of England, Scotland, and Ireland. At Derby I went to the Arboretum, which I had seen when it was first laid out. How singular that such a magnificent and wise example as that afforded by the donation of Mr. Strutt, has not been followed! I think the late Lord Holland (always first when the liberty or happiness of the people was concerned), dedicated his Alameda at Ampthill to the inhabitants, before Mr. Strutt gave his garden to Derby. Since the original plan was completed, some parties (a committee, I believe), have made a handsome addition of some six acres to the original arboretum, and there is a good house erected at one end where parties have tea, &c. Loudon, I think, laid out the grounds, if heaping up little irregular wavy banks all of one sameness, and planting them higgledy-piggledy with trees, together with two straight walks, and one wavy walk, be called laying out. Even the gardens at Chiswick appear creditable, when compared with those at Derby; but there is one principal fault; the trees are planted much too close to each other; there are some splendid specimens of Oaks and Thorns, already growing one into another, and in a year or two the whole will be a mass of confusion. The planter seems to have had no notion as to what 10 or 15 years would do, and to have planted his trees, not with any idea that he was planting an arboretum which was to show each specimen tree, but to have grouped the trees together, as in a shrubbery, or a cockney garden, to make an immediate effect; however, there is plenty of room in the additional 6 acres; and it is not too late; with Mr. Barron's (Elvaston Castle) skill and knowledge, trees three times the size of those in the Arboretum might be safely moved, and it will be well to take out every other one of the large trees and plant them elsewhere, otherwise the Arboretum will be a mass of confusion, or half the trees must be cut down. The smoke of the town appears to affect the growth of the trees, and I should think the climate is prejudicial; many shrubs seem to have died, and except in the coarser-growing and hardier trees, I saw little luxuriant growth. Indeed, the climate did not appear so favourable to vegetation as much further north, where I now write (Crief).

I was glad to find that the gift was duly appreciated, and that the gardens are often thronged. It is entirely an arboretum, for with the exception of a clump or two of Roses there were no flowers, and yet there are printed exhortations not to pluck flowers, in different parts of the grounds, just as if the flowers were in existence. I think this want made the garden dull; and if it is too expensive to have flowers, this might be managed as is done at Frankfort, where the public gardens are given up to a seedsman, on condition that he grows, in well arranged beds, fine annuals, such as Sweet Peas, Stocks, Asters, &c., he having the seeds for his pains; and thus a succession of flowers is kept at no cost—an arrangement worthy of a town of merchants.

From Derby I made an attempt to see Elvaston Castle, but in vain; and yet I tried more than one way. The gardens are hermetically closed against all comers; this was mortifying, as the description given in the *Gardeners' Chronicle* had made all amateurs anxious to inspect the large trees transplanted by Mr. Barron, and also to see the grounds, with the wildernesses of evergreens. It was almost unfair to put such a tempting description in your Paper, seeing that there is no means of obtaining admission to the reality. The story goes that even the Duke of Devonshire went as a gardener; however, be that as it may, my application (though very humble) was refused in more than one quarter. I really think Mr. Barron should, in some outworks (accessible to all) transplant some four or five large trees, so that one might see how far the marvels told of his success are realised.

At Chatsworth the gardens are shown at all times, but the great conservatory only on a special application to Mr. Paxton or his Grace. My principal object was to see the Orchidaceous plants, the collection containing some magnificent specimens; perhaps the finest are a very large plant of Ansellia africana and one of Dendrobium chrysanthum, but I had not much time to make any very minute observations. The collection is very large, and on the whole the plants appeared well grown and clean, but still I did not think the style of culture approached those in the collections of Mr. Rucker, Mr. Warner, and Mr. Hanbury, being those I have principally been in the habit of seeing. There are some fine Pitcher-plants, but these I understood have been recently purchased. The Palms looked well, and produced a grand effect in the great conservatory, soon, however, to be rivalled by Mr. Paxton's still grander building in Hyde-park. With the exception of the Palms, the house was rather disappointing; the borders are filled with not very interesting plants, which cluster up and prevent one from seeing the whole effect of the Palms. I cannot help thinking that, either the undergrowth should be entirely cleared away, or that the space should be filled up with smaller and more gay flowering shrubs; the house is deficient in large creepers; a Bougainvillea and Mandevilla suaveolens, and some of the grand Bignonias, would tell well, festooning from the lofty gallery, which at present is only partially covered. I should mention a magnificent specimen of Renanthera coccinea, which had two large flower spikes, and two or three others coming on; it flowers here, I was told, every year, being kept dry and well exposed to the light and sun. *Dodman.*

(To be continued.)

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND;

OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]—No. III.

CULTURE OF THE MIND.

ON SOIL.—A light sandy loam, on a bottom of stone or gravel, is the most suitable naturally to its growth. If this is not to be had, perhaps we are better without it, for we can easily supply what probably will do better. In such a case, therefore, I would advise that a border, about 8 feet quare and 2 feet deep, should be dug, and paved, if possible, or, in a stiff clay, puddled. But if you cannot do this, place a few large flat stones or bricks, closely fitted, immediately under the Vine, to give its roots a lateral or sidling direction. A pipe-drain should then be put in the whole length: the greater the fall the better. This border should be filled up with dry rubbish of every description—of tiles, stones, broken bricks, old mortar, pottery, oyster-shells, road-scrapings, and earth burnt with wood. When the water from the roof is not carried off by pipes, I think it would be highly advantageous that the top of the border should be paved as far at least as 3 feet from the wall; as I have little doubt that the constant dropping of water in one place tends to injure the larger roots which are not feeders, but only channels of food; since I have known branches to be completely rotted through from this cause. I have also observed Vines to flourish remarkably well under pavements, which I am inclined to believe is owing to their retaining the heat so well, and to the dryness thus afforded to the roots, which, on removing the pavement, will be found to be clinging to it.

Nothing, if possible, should be planted on the border; at any rate, it should be kept perfectly free from weeds and fallen leaves, and as much sun and air be allowed to get to it as possible.

EXPERIMENTS.—Perhaps if either a trench of manure were made on the outside of the border (though I do not recommend this when close to your dwelling, for, if it brought health and vigour to your Vine, it would certainly bring sickness to you and your family), it would increase the temperature of it, or a channel of water from whence the small roots might always get a supply, without the soil becoming damp and close.

MANURES.—To be mixed with the soil when made for the border; the best are whole bones, charcoal, hoofs of cattle; also cuttings of leather, woollen rags, feathers, hair, &c.

LIQUID.—If the goodwife does any washing, apply the soap-suds on a summer's evening in drills, and rake the soil over. If the goodman kill a pig, do the same with the blood. Soot-water also; one quart of soot to 12 of water; drainings of dung-heaps, &c.

TOP-DRESSING.—All prunings, leaves, weeds, &c., should be put into a heap to rot, or, what is better, charred in a fire which is kept slowly burning, by being smothered with soil, by which means all seeds, insects, &c., are got rid of, and is in such a state as to afford immediate food to the plant. Apply it as a top-dressing in November.

Never waste any vegetable matter, for what has once been vegetable is ready to become so again, and a person might as well expect abundance of water, after no rain, in a well which he is constantly exhausting, as plants to flourish when the vegetable matter, of which so large a part is formed, has been extracted and never given back to the soil. *C. A., October* 15.

Riches, like muck, are of no use unless spread.

A wise man scorneth nothing be it never so small or homely.

Every little makes a mickle; every mickle makes a muckle.

Manure, like money, must be heaped little by little before it can be used to any effect.

Always taking out of the meal-tub, and never putting in, soon comes to the bottom—as poor Richard says.

As self-evident an axiom as the nose is part of the face, or that knowledge is not practice.

BRITISH SONG BIRDS.

No. IV.—Having given good and sufficient reasons why we do not advocate "Mechanical Aviaries," which, at best, are but toys; we will now turn our attention to the erection of a substantial and proper Palatial residence—fit, in every respect, for the reception of Birds of Song.

As many amateurs may be situated precisely as I was, as regards the position of their house, I will describe, as accurately as may be, the manner in which I proceeded. My aviary, first erected at Kennington, was a substantial building of wood, and at the rear of the house. From the limited size of my garden, as to width, I so contrived that the back-door on the ground-floor opened immediately from the house into the aviary; so that, in wet weather, constant access might be had, to and fro, without incurring the risk of taking cold.

Immediately between the back door and the aviary, was a small room, or recess,* with a covered roof, wherein was fixed the stove intended to warm the bird-rooms in the winter. I could thus have entrance to the back garden, either through the side door of the small room (opening on the left into the garden), or I could walk through the entire length of the aviary, if necessary, making my exit through the door at the extreme end.

Since I removed from Kennington to Hammersmith, the original aviary has been partly re-constructed, and placed in quite a different position. It is now at the bottom of the garden (which is 120 feet long and 34 feet wide); and the front windows face my dwelling-house. This is a remarkable improvement every way. It has also been divided into two distinct portions, each complete in itself.

The second portion, for warmth in winter (there being no convenience for a chimney at the bottom of the garden), has been erected immediately contiguous to my house; whilst the other, assigned to the hardy birds only, who require no fire during the winter, remains exposed, like any other building.

The proper length of a detached aviary is 15 feet; width, 9 feet; height, 11 or 12 feet. Of course, if two aviaries united in one be required, the proportions will be just, or nearly, double, as regards the length; with a glass door, and a latticed-wire partition across the centre.

In the winter, the lattice-wire should be covered over with green baize, and all draught excluded, as far as is practicable. The ceiling should, of course, be flat, and the roof shelving from the front backwards. The latter should be covered with zinc, and a gutter of the same material should be made to convey the water from one corner of the roof, at the back, downwards into the ground.

The building should be entirely of wood. There should be three windows in the centre of the front, equally divided, and boarded above and below; also two windows at one end of the aviary, equally divided, and boarded above and below: at the opposite end, a glass door of entrance; immediately over which there should be a double window, opening outwards on hinges. To protect it, and to prevent the escape of the birds, a moderately close net work of galvanised wire should be nailed on, from the inside. The birds will then get plenty of fresh air, and be able to introduce themselves to their brethren in a state of freedom, who will assemble in numbers on the adjoining trees and branches to join them in their song. My garden has always been the resort of multitudes of these song birds; and the harmony during the seasons of spring and summer, not excepting the piping of the thrushes and blackbirds in the winter months, has been delightful.

One of the panes at the opposite end of the aviary should also be made to open outwards, with hinges; and the interior lined with wire-work, whereby free ventilation will be secured. This is important. The back of the aviary should be entirely of wood, by which means it will be more readily kept warm and snug. The front should be painted white, with at least three coats. It should afterwards be ornamented with double cross-barred lattice-work, painted green; not too close, but arranged with a due regard to relief or effect.

Between each window, and at the extreme ends of the windows, should be upright fluted pillars of wood, which, though really hollow, appear when viewed from a distance, perfectly solid, and important withal. These pillars should be strongly painted in green, excepting the plinths, which should be white; the facia, of stone colour; and the ornaments running round the top of the building, of a Vandyke pattern, painted green. Thus much as regards the general directions for the erection of the building. The internal arrangements we shall discuss anon.

With respect to the "look-out" of the little musicians; this requires some judgment. There can be no doubt that they are most in their element (during confinement) when in the immediate neighbourhood of trees, shrubs, flowers, and plants. It will be desirable, therefore, to render the aviary as umbrageous as possible; and to have it overarched, at all events in the summer season, with drooping foliage. An Ivy plant would greatly assist in this matter, and a Honeysuckle; also some fine Cubas, which would soon grow bushy, and look very handsome on either side. A Palm and a Sycamore tree would also be of rapid growth. The more secluded—except at the front, which must be kept more open—the better, on every account. It attracts the wild birds, and tempts them to take up their quarters with you; thus strengthening your own or-

* I erected this little ante-room for the express purpose of placing a stove in it, inasmuch as there was no other place where I could have broken into a chimney; nor could I have had a chimney elsewhere, without occasioning a nuisance to my neighbours, in the matter of smoke.

chestra, and improving the taste of the respective performers; for we must ever concede, after all, that Nature is the best teacher.

Round all the windows, on the outside, a miniature balcony should be affixed, in which might be placed pots of Geraniums, Calceolarias, Sweet Williams, Pinks, Sweet Peas, and other varieties. These, when properly bestowed (not too crowded), show off your birds to great advantage; for while they sit singing on their perches at the window, their plumage and action will be distinctly visible between the flowers, from one extremity of the garden to the other. *William Kidd, New-road, Hammersmith.*

HINTS FOR THE CULTIVATION OF BABIANAS, GLADIOLI, IXIAS, SPARAXIS, TRITONIAS, &c., &c.

In the Open Borders.—In September, or at the latest in October, prepare your beds or borders by well digging them a spit deep, burying a stratum of good rotten manure at the bottom. The surface soil should be rendered open by mixing sand with it, and being well broken in the digging; plant the bulbs in clumps or rows, from 2½ to 6 inches deep (depending on size of root and sort), taking care to cover them 1 inch deep with sand previous to recovering with the mould. After the roots are planted rake the ground well, giving it a southern inclination if possible, keep it free from weeds and stir it occasionally with a small fork, which accelerates their growth; in case of very severe frost, cover the surface of the ground 2 or 3 inches deep with dry litter or sea sand. The different varieties will flower from May till August.

Pot Culture, either for Flowering in the Pots or turning out in the Borders early in the Spring.—In the month of October examine the roots and separate the offsets from them, put them in light turfy loam and sand with good drainage, putting a layer of well rotted cow-dung at the bottom of the pots, the strong growing varieties of Gladioli are to be planted in. Prepare a bed of dry old tan and litter from the stable, and place a frame on it, in which plunge the pots, the Gladioli at the back, and Ixias, Sparaxis, Tritonias, Babianas, Oxalis, and Lachenalias, &c., in gradation to the front; give plenty of air in fine weather, and withhold water until the bulbs have made root and the leaves appear, and it must then be carefully given when there is no danger of frost. Should the winter prove very severe, bank the frame up well with dung or litter, and cover the lights with straw or bass mats. Under this management the Sparaxis will flower in April, the Ixias, Babianas, Gladioli and Tritonias succeeding one another. After the flowering is past continue the watering, to perfect the growth of the bulbs, and gradually withhold it as the leaves die away and they ripen. Bag the roots, place them on a dry shelf, and they will be ready to replant the following season. *B. Saunders, St. Heliers, Jersey.*

VILLA AND SUBURBAN GARDENING.

After having followed implicitly the instructions I have occasionally given, some of my amateur friends, who cultivate plants in pots, have been much puzzled and disheartened from their want of success. The best peat that Wimbledon affords has been carefully selected. The most approved sand of Surrey has been obtained. Every attention to drainage has been paid; and the system of potting, which has appeared in these columns, has been adopted; but the plants looked sickly and stunted, and no apparent reason for such an unhealthy hue could be adduced: air and water being regularly supplied, when circumstances permitted. Nevertheless, Heaths and New Holland plants existed only as miserable objects of compassion. In one the interest attaching to such pursuits became diminished, another got disheartened, and a third began to cultivate such plants only as required little skill or attention. New supplies of plants had been from time to time obtained, but the same appearance presented itself. Their healthy vigour was replaced by the sickly complexion of the old stocks. When by accident I called upon one of my friends just in the midst of his gardening amusements, in truth, watering his plants, and lamenting his hospital of invalids, with a mournful countenance and a perplexed mind, I was instantly appealed to, with a view to unravel the mystery. "Proceed," I observed, "with your operations, while I look over your plants;" when presently my ears, not my eyes, discovered the evil genius which presided over his favourites. This was the action of a pump at the end of his little greenhouse. Here he was drawing water from the bowels of the earth, hard and cold, and pouring it immediately on the roots of his plants. Now, I have no doubt, that although this has been frequently discussed, the vile practice is still in active operation in other places, besides my friend's. Plants, like animals, require care in feeding. It does not follow that because a man in a harvest field may drop down dead from the effects of drinking cold water, that a plant so treated will do the same; but its death, although slower, is, perhaps, as certain to arrive. Now, it may be laid down as a rule to be adhered to strictly, that water, or liquid manure, when given to plants, under every condition, should be a few degrees warmer than the temperature of the soil in which they are growing. The roots are thereby in some measure cherished and stimulated, not chilled and checked.

With regard to the hardness of the water, I shall offer no opinion founded upon other analysis than that of the feel of the hand, by which most people can readily detect it. Having the care of a large collection of plants, and suffering to some extent from the want of rain-water, I was induced to follow the recommendation of an authority who maintained that if such water was warmed no injury would result from its use. I instituted several experiments on the matter; some was warmed, some boiled, and partially cooled again. These were applied to some Heaths, in the same house, with those to which rain-water was exclusively administered. In the course of three months the effect was quite apparent. The surface of the soil, where the hard water was applied, became, when wet, slimy, and when dry, covered with a cake; while no such effect was produced with pure rain-water, which the plants appeared to enjoy, and under which they grew away vigorously. *Pharo.*

Home Correspondence.

Gleanings about Water Lilies.—To those who may be about to erect structures for the growth of the magnificent Victoria Regia, any scrap of information will be acceptable. Calling some time since at the gardens of — Spode, Esq., Augmering Park, Staffordshire, I found a newly erected house occupied by a plant of this queen of the waters in perfect health. It had, as I was informed by Mr. Bolus, the gardener, been planted only 10 weeks; even then its gigantic leaves were exhibiting the rim, which is only perfected in plants of good health, and the first flower-bud was approaching the surface.* Mr. Bolus very obligingly gave me the following particulars, relative to its culture. In deference to the prevailing opinion, that bottom-heat was necessary, provision for a good command of it was provided, by running several pipes through the bottom of the tank, in addition to a small one resting on a ledge about 6 inches below the surface of the water, and passing quite round the reservoir. When the Lily was fresh planted, the means of supplying bottom-heat was brought into play, but the plant refused to make any satisfactory progress, the leaves rotting before they had attained any considerable size. Pondering upon the probable cause, Mr. Bolus, by way of ascertaining what an opposite mode of treatment would effect, discontinued the use of the bottom pipes, using only the small one on the top, before alluded to. In a few days a perceptible change for the better was apparent, and so rapidly did the plant progress that bottom-heat has never since been applied. By the use of the small surface pipe the water, at 1 foot below the surface, can be kept at 80°, and by the aid of solar influence, as was the case on the occasion of my visit, a thermometer at the depth mentioned indicated 86°. There is much to hope that from this magnificent flower and some of its hardier allies, many beautiful hardy hybrids will be produced. Calling, I think in August, at the gardens of — Drummond, Esq., Aubrey-park, near Dorking, in Surrey, Mr. Morse, the gardener, pointed out to me, in a tank in the open air, a plant of Nymphæa cœrulea in excellent health, where it stood the winter. I believe he also mentioned that it had bloomed. By its side, growing luxuriantly, was Limnocharis Humboldtii. That these plants, usually grown in the stove, should exist satisfactorily in the open air, subjected to our winters, affords much matter for speculation and experiment. In hardy water plants our collections are but scantily supplied. A wide and untrodden field is opened to the hybridiser. It is hoped that those who have the opportunity will make the most of it. Those who take an interest in plants when strolling through the garden of Hampton Court, may have noticed in the water there a large plant of Water Lily protected by a wire net. I learned from Mr. Johnson, the gardener, that he discovered the plant growing in the Thames, and struck with its beauty removed it to its present situation. Its leaves are very much larger than the common white Water Lily of our ponds, and its flowers, which are twice as large, are produced in abundance quite down to the autumn. Would not this hybridise with the Victoria regia? *G. L.*

Vine Borders.—I am surprised to find so many gardens still adopting the old-fashioned plan of covering Vine borders with stable manure at this season of the year. Such treatment wastes the manure, sours the borders, and induces shanking. I fork up my borders, in the latter end of October, in fine dry fresh weather, although the roots are close to the surface; still I like three inches of the soil to be forked up, which obviates sourness, and refreshes the ground. It is a mistake to imagine that frost will injure the roots of Vines, when there are two inches of earth on the top of them. When I begin to force, I cover the borders with warm dung, in order to assist the roots. This is absolutely necessary (although very seldom done in Scotland), or the Vines will break weakly, and will be long in regaining their strength. My Vines are in the very best of health; and at the present time I am cutting bunches of Black Hamburgh, from three to four pounds weight, and with berries four inches in circumference. I am of opinion, that if gardeners generally adopted my system of forking up their Vine borders, there would be fewer unsightly Vines in the country. *T. W., Motherwell.*

Stent's Kidney Potato is not a seedling. I and many of my neighbours have grown it for six years, both in Lincolnshire and Yorkshire; it is called the Lapstone Kidney. I believe it was raised by the late James Carr Cottingham, about seven or eight years ago; it is one of the best second early Potatoes grown. I hope that Mr. Stent, as a professional agriculturist, will see the utility of calling things by their right names; for rechristenings always tend to produce a confused nomenclature. I agree with you with respect to the removing the haulm from Potatoes as soon as disease appears. I have done so for the last three years, but instead of cutting it off I pull it up, at the same time placing one foot on each side of the row, which prevents the Potatoes from being pulled up with the haulm, and I then roll them with a light roller. I left some without removing the haulm, and when they were taken up about one-fourth of them were diseased, while those from which the haulm was removed were hardly diseased at all, and the crop was equally productive. *S. Lapstone, Nov. 2.*

Silkworms and Home Production of Silk.—Allow me to offer a public tribute of grateful respect to the memory of a lady lately deceased, whose letter to the Agricultural Society, published in your Paper of August 17, 1844, induced me to attempt the growth of silk in this country. Few may be aware of the untiring energy with which Mrs. Whitby prosecuted her industrial project. Few may have given the subject more than a transient thought, but from some years' experience, I find the only difficulty is in raising a sufficient supply of food, which time and good cultivation may overcome. If, however, the late frosts and variable climate of England generally should prove an obstacle to the profitable cultivation of the Morus multicaulis, and other varieties of Mulberry, which thrive so well in South Hants, none such presents itself in our eastern colonies. Already a company is formed in Guernsey, and many private individuals are trying to carry out the growth of silk. May their success do honour to the memory of the Christian spirit, which devoted itself in the cause of national industry. *A Subscriber.*

Premature Decay in Growing Larch Trees.—A friend having occasion to cut down a few Larch trees in an old plantation, was surprised at finding several of them more or less rotten at the core. Utterly unable to account for this, he proceeded to try if the defect extended to other trees in different parts of the plantation, and the result was, that out of every six trees he felled one was diseased at the heart. The plantation in question is on a declivity; the soil is sandy, admirably adapted to the growth of Larch, as well as most trees, particularly evergreens. The Larch trees in this wood are 50 years old and upwards—fine, well-grown trees; they do not seem to stand too thickly together; for, notwithstanding the loss of their lower branches, they are many of them 2 feet through, some feet from the butt. Can you give me any idea of the cause of this disease? The specimen I have enclosed is remarkable as being from a tree which is the only one in which, apparently, the disease has not commenced at the core, which was perfectly sound, at least to the superficial observer. In all others the core was evidently the first part affected. I shall be glad to have your opinion on this curious circumstance, which has completely baffled the woodmen of this neighbourhood. *Henry Cooper Royle.* [This is a case of what is called the rot in Larch. The mischief is done by a dry-rot fungus. The cause has not been satisfactorily explained.]

Seedling Russian Violets.—A gardener named Schakell, in the immediate neighbourhood of this city, has been fortunate in raising a seedling from the old favourite, the Russian Violet, which is a decided improvement on the parent; of much more robust growth, equally hardy, a profuse bloomer, larger and deeper coloured flowers, on very long footstalks. He requested me some little time ago to bring it to your notice, that a favourable report from you might make it generally known, and obtain for it a widely extended sale; I forebore, however, until I saw it in cultivation, which I have now had an opportunity, in comparison with the old variety and with the same cultivation; have found it infinitely superior on all the points I specified in the commencement of my note, and have no doubt that it will entirely supersede its parent, and that your recommendation of it will prove very satisfactory to the lovers of that fragrant flower, and ensure to the grower a full remuneration. I enclose two or three blossoms, which will show you the size of the flower and the length of the footstalk, though I fear they will arrive too dry to form any judgment of its other merits. They were gathered in the dark from a plant in my garden, and a more unlikely spot for good cultivation can scarcely be imagined. *N. U. N., Bath.* [These are certainly very fine Violets, and we must add, that our correspondent, a gentleman of fortune, is as good an authority as could be taken]

Monstrous Pine-apple.—In cutting a black Jamaica Pine-apple the other day, I found to my astonishment that the crown, which was a fine one, was showing fruit. Is this a common occurrence? [No.] *F. Ward, Stratford-on-Avon, Warwickshire.*

Galvanised Wire for Fruit Trees.—I have been recommended to adopt galvanised iron wire for training fruit trees on, and would deem it a favour if any one would give me the following information: 1st. Has it been generally approved of? 2d. Is there any objection to it? 3d. Is it better than nailing the trees to the walls? 4th. What would be the average duration of it, if properly put up. *J. H., Dunglass.*

Bird's Water Purifier.—I shall feel obliged to any readers of your Paper, who can give me any information as to the merits of Bird's Syphon Water Purifier; also

* The readers of the *Chronicle* are aware that it has since flowered.

for any remarks on the advantages and disadvantages of the syphon, as a raiser of water, the material it should be made of, &c. *M. J.* [We must refer our correspondent to our own experience, as recorded at p. 696, col. *b*.]

Foreign Correspondence.

Churra Poonji, Khasiah Hills, *Aug.* 28, 1850.—I was greatly pleased with your remarks on the influence of hot-house growth, &c., on the colours &c., of plants in the *Gard. Chron.*, but do not quite follow them in nature. I am sure that we not only spoil colours but organs by a choking system of cultivation; and yet both here and in Sikkim our richest coloured flowers are produced in the deepest woods, expand and die, though the sun often does not appear for one minute for 10, 15, and even 26 days in succession! Free air, of course, they have plenty, and a moderate temperature. The colours of the Dendrobia and Cœlogynes and Vandas are as bright at home as here, from the sunless climate common to both localities: whereas I suppose your South-American, Mexican, &c., Orchids, are far better supplied with sun-light in their native woods than in England, and hence degenerate. Here 500 inches (41 feet and more) of rain fall annually; 130 fell last month alone, 35 have fallen in 24 hours, and 10 a-day for 16 days in succession. I have compared the rain gauges, and used both my own, too, (a 2-inch and a 5-inch), and it is a true bill. The temperature of Churra is very uniform during the summer months; 60° to 80°, and for days together, 64° to 70° have been the extremes of this month. Often, however, when the mists clear, the temperature rises to 82° in a few minutes; and in some parts of the station (altitude 4000 feet), hot gusts of air from the gulleys and plains below are driven across the station, and raise the thermometer 6° or 8° in a few seconds. Hence here, as in all hill stations, I find the mean always too high, if taken from the maximum and minimum thermometers. Very transient strong heat in the day (of 10° above the average), and lasting but for a few minutes, is a common phenomenon; but there is no check to this by a temporary extreme of cold in the night; for the 12 hours of day the thermometer will range between 68° and 70° for 11 of them, and rise to 82° during the 12th. At night it is invariably between 64° and 66°. The maximum and minimum thermometers give the mean of 64° and 82° for that of the 24 hours; the mean of the whole 24 hours is, of course, widely different. I quite agree with you that we have no known means of ascertaining either the amount of heat a plant requires or gets. I bury a thermometer 2 feet deep wherever I go; its fluctuations are never diurnal; one-tenth, or so, every three days, is perhaps the average extreme. I thus get very closely the decrements of temperature for small elevations, and some data for bottom-heat. The mean temperature of the air I have never attained at any depth down to 11 feet; and the idea that it is to be had at a few feet in the tropics is quite erroneous. The temperature of the plant (*i. e.*, of its juices) is, I find, materially dependent on that of the soil at its spongioles; and a good large unripe Shaddock on the tree will maintain the same temperature (in the plains of India) with the thermometer in the air at mid-day at 110° and at midnight at 68°; the black bulb in the sun at 150°, and radiating thermometer at night at 58°, with plants and fruits, I need not say, fully exposed to all their vicissitudes. I wish I could say that I could detect the smallest influence on vegetation in diminished atmospheric pressure. I know that Baron Humboldt assumes it, and you I think assent, if not consent; but a comparison of Arctic vegetation with that of elevations of 17,000 feet, where literally 15 inches of pressure are removed, shows no difference in the characters or habits of such plants as are common to both regions; it certainly induces no peculiarity of vegetation, or there would be a character common to the Alpines of India and of America which the temperate and Arctic regions should not share; but though the Alpine floras of these tropical regions widely differ from each other, they are both Arctic floras in the greatest degree, generically. Again, the Cardamine hirsuta, or Capsella, or other plain plants of the cold weather in India, are identical with the same species of the Alpine summer. What variations are due to elevation appear in no way amenable to any laws of diminished pressure; and I could illustrate this I think far more satisfactorily by examples taken from the temporary effects of diminished pressure on man, which are of so very short a duration, and from those of domestic and wild animals. I have failed to appreciate the slightest effect of diminished pressure on vegetation, direct, of course, I mean. Heat, evaporation, &c., are the active causes dependent on pressure in a great degree, and the mechanical composition of the soil is another—not the chemical, that I can discover, except in a few notorious instances. *J. D. Hooker.*

Societies.

Horticultural, *Nov.* 5.—E. Brande, Esq., in the chair. J. Knowles, Esq., of Trafford Bank House, near Manchester, sent a great rarity, in the shape of a Burlingtonia, from Demerara. It was in a rustic basket, whose sides were covered by its numerous pendent, dense spikes of beautiful white blossoms. A Banksian Medal was awarded it.—Messrs. Veitch produced a small example of a new Cœlogyne, called maculata, one of those charming terrestrial Orchids, which inhabit the mountains of India; also a handsome specimen of the true Calanthe vestita, for which a worthless variety, without the red eye, is sometimes sold, and a small bit of a Leschenaultia, from Swan River. A certificate of merit was awarded for the Calanthe.—Mr. Hamp, gr. to J. Thorne, Esq., sent Hippeastrum aulicum, and a nice exhibition of Epiphyllum truncatum, and its varieties, for which a Banksian Medal was awarded.—The great headed Pimelea (P. macrocephala), a robust stiff-growing kind, was exhibited in a small state, by Messrs. Henderson, of Pine Apple Place; and a seedling Pentstemon, white streaked with pink, called Salteri, by Mr. Salter, of Hammersmith.

Some good Fruit was exhibited. Mr. Bray, gr. to E. Lousada, Esq., Sidmouth, Devonshire, received a Banksian Medal for a handsome Providence Pine-apple, weighing 11 lbs. A similar award was also made to Mr. Ingram, gr. to her Majesty at Frogmore, for two finely-swelled fruit of the smooth-leaved Cayenne Pine, weighing respectively 7 lbs. 8 oz. and 7 lbs. 3 oz.—Queens, for which a Certificate of Merit was awarded, were furnished by Mr. Watson, gr. to Mrs. Tredwell, of Norwood; their weights were respectively 4 lbs. 14 oz., 4 lbs. 4 oz., and 3 lbs. 12 oz.—Mr. Slowe, gr. to R. W. Baker, Esq., had a Providence weighing 9 lbs., and a bunch of Red Hamburgh (or possibly Black Hamburgh badly coloured) weighing 4 lbs. 4 oz. This enormous bunch was perfectly formed in all respects, quite ripe, and well deserved the Certificate of Merit which was awarded it.—Three admirable bunches of West's St. Peter's Grape, weighing 1 lb. 14 oz., 1 lb. 8 oz., and 1 lb. 5 oz., were furnished by Mr. Martin, gr. to Sir H. Fleetwood, Bart., of Hill-house, Windsor Forest; the same grower also sent three unripe bunches of Muscat of Alexandria, weighing respectively 1 lb. 15 oz., 1 lb. 7 oz., and 1 lb. 5 oz. A Banksian Medal was awarded for the West's St. Peter's.—Mr. Forsyth, gr. to Viscount Barrington, exhibited three bunches of Muscat of Alexandria, the peculiarity about which was that they had been ripened in the temperature of a greenhouse. The heaviest bunch weighed 1 lb. 3 oz.; though not so fine as if they had been ripened under more advantageous circumstances: they were, nevertheless, fair eatable Grapes. A large basketful of the same variety of Grape, possessing a colour like that of Coe's Golden Drop Plum, came from Mr. Davis, of Oak Hill, East Barnet, to whom a certificate of merit was awarded; and Mr. Turner, gr. to W. Blake, Esq., of Danesbury, sent examples of Black Hamburgh Grapes, ripe and sweet from the open wall. It was stated that they were part of 156 bunches ripened by the same Vine this year. Specimens of Marie Louise, and of Van Mons Leon le Clerc Pears were furnished by Mr. Davis, of Oak Hill. The latter is a large handsome Pear, said to be equal in flavour to the Marie Louise. Nothing is known as yet of its capabilities as a standard; but it was stated that it will not grow on the Quince stock. A certificate of merit was awarded for the last named fruit. French Crab Apples, the produce of 1849, were exhibited, in good condition, by Mr. Milne, gr. to the Earl of Clare, Mount Shannon, Ireland. A dish of Matchless Marrow Peas, sent as a proof of the power of sulphur in destroying mildew, was shown by Mr. Fry, gr. to Mrs. Dent, of Manor House, Lee, Kent. Mr. Fry stated, that at one period of their growth they were seriously attacked with mildew; sulphur was then applied, which arrested its progress, and the Peas have since grown most luxuriantly, producing a fair crop, considering the badness of the season, and the low temperature to which they have been subjected, 3° of frost having been endured by them. Among miscellaneous subjects was a number of drawings of various kinds of flowers and fruit executed on rice paper, from Mrs. Dickens of Hereford-square, Old Brompton. These were satisfactory examples of the style of art to which they belong, and attracted the attention of the ladies present. From the Garden of the Society came the handsome Dendrobium Gibsoni, Stanhopea graveolens, Epidendrum fragrans, the Musk-scented Angelonia (A. moschata), Ipomœa ficifolia, a gay plant at this season of the year, the greenish white trumpet-flowered Solandra lævis, the old-fashioned Salvia pulchella, which has lately been sold under the false name of S. elegans, three Cape Heaths, the charming pale violet blossomed Lyperia pinnatifida, a plant which is nearly always in flower; the handsome and very curious hybrid Veronica Andersonii, some Chrysanthemums, and other plants, together with fruit of the Marie Louise Pear from a wall, and the following vegetables: Oxalis Deppei, one of those Mexican Wood-Sorrels, whose large fleshy fangs or roots form an inferior, but, under some circumstances, a useful accessory to the table. It was mentioned that the French use the leaves as Sorrel, which they say have "a mild flavour, and are easily cooked." Green Winter Roman Lettuce (Laitue Romaine Verte d'Hiver), a new variety of Cos Lettuce received from M. Vilmorin, of Paris. Its chief merit consists in its hardiness, which is stated to be about equal to that of the brown Cos, which is objectionable on account of its colour.

After the meeting had commenced, some very fine Muscat Grapes were produced by the gardener of a gentleman living, we believe, near Chertsey; but as no entry had been made of them, and no memorandum was left by the exhibitor, we can report no further respecting them.

Linnean, *Nov.* 5.—The President in the chair. The Secretary read a list of works and specimens that had been presented since the last meeting in June. Amongst the last was a collection of fruits from the East Indies, by J. S. Ralfs Esq., consisting of some rare and very fine specimens. A collection of plants from the herbarium of the late Mr. Griffith, from the Honourable East India Company. A small collection of plants from the river Clarence, collected by Mr. Epps, and presented by Mr. Henry Sowerby. A single specimen of Primula imperialis, also of a rare species of Viola from Java, collected by M. Junghuhns, and presented by M. de Vriese. A bust of the Baron Benjamin Delessert, from his brother M. François Delessert. W. Saunders exhibited specimens of Cyclamen hederifolium, found near Hastings. A paper was read from Captain Champion, on some new species of the family Ternströmiaceæ, found at Hong Kong. Amongst these he described three new species of Camellia, a new species of Eurya, and some species belonging to two new genera, Pentaphyla, and Ixioanthes; also a new species of the genus Cleyera. Some of these plants possessed very beautiful flowers, and gave out a delicious fragrance, and were well adapted for culture in England. Mr. Westwood described two new species of Cerapterus, belonging to the family of Paussidæ from New South Wales. Robert Ellis Esq., and W. H. Hallett, Esq., were elected Fellows.

Entomological, *November* 4. — The President in the chair. Mr. Stevens exhibited several cocoons of a species of Bombyx, from Columbia, some of which contained two perfect chrysalids. Mr. Shepherd exhibited a curious specimen of Nonagria crassicornis, the wings on one side being male and on the opposite side female, and the body and antennæ being male. Mr. Stevens also exhibited a very interesting box of specimens illustrating the natural history of numerous species of Australian insects, and several interesting Coleoptera, including the Agasma semicrudum, recently described by Mr. Newman as of doubtful affinities, but which Mr. Westwood stated to be nearly allied to such Heteromerous genera as Cistela, Ditylus, Dryops, &c.—Mr. J. F. Stephens exhibited a unique British specimen of Lycus aurora, taken in Perthshire by Mr. Weaver; also specimens of a new British Tinea (T. ochracea of Tengstrom), found in ants' nests.—The President read a series of queries on the habits of various British insects, forwarded to the Society by M. Blisson, and exhibited a specimen of the rare Sphinx Celerio, from Ipswich, communicated by Mr. Geo. Ransome. Mr. F. Bond read a notice of various Lepidoptera, the larvæ of which feed on the common Ivy, including Triphœna orbona and Ianthina, Mormo maura, Ourapteryx sambucaria, Alcis repandaria, Tortrix Rosana, &c.; and also exhibited specimens of various moths from Ventnor, Isle of Wight, including Agrotis lunigera and Depressaria cuprella. Mr. W. F. Evans presented some specimens of musquitoes from Great Slave Lake, captured on the 28th June last, by one of the expeditions in search of Sir John Franklin. An article by Mr. James Eames was read on a black-headed maggot, which destroys crops of Clover by eating the hearts of the plants. A paper was also read by W. W. Saunders, Esq., F.L.S., containing descriptions of various remarkable large corn beetles from Australasia, accompanied by two plates, presented to the Society by the author. Also a memoir by Mr. C. Hewitson, Esq., on some beautiful new species of exotic butterflies, accompanied by a plate, also presented to the Society by the author; and, likewise, a paper by Mr. Westwood, containing descriptions of new species of Evaniidæ, being a supplement to his memoir on that family, published in the Society's Transactions.

Review.

The Sugar Planter's Manual, being a Treatise on the Art of obtaining Sugar from the Sugar-cane. By W. J. Evans, M.D., 8vo, pp. 244. London, 1847.

The Practical Sugar Planter; a complete Account of the Cultivation and Manufacture of the Sugar Cane. By Leonard Wray. 8vo, pp. 415. London, 1848.

The Manufacture of Sugar in the Colonies and at Home, chemically considered. By John Scoffern, M.B., 8vo, pp. 160. London, 1849.

Copies of Report and Correspondence on the subject of Dr. John Scoffern's Patent for Refining Sugar, presented to Parliament, 14th August, 1850. Folio, pp. 18.

From what has been said respecting the cultivation of the Sugar-cane, it is plain that great loss is occasioned by want of due attention to the time and mode of cutting; instead of endeavouring to obtain the largest quantity of pure saccharine juice, the planter has his attention drawn aside to other objects, and has to make that, which should be his first care, dependent on other considerations, such as weather, fuel, manure, &c.

By employing the dried megass or crushed canes as fuel, two very serious evils are occasioned, not merely, as we have already stated, does the Sugar manufacturer lose from one-quarter to nearly half the Sugar which his canes contain, because he crushes them imperfectly, fearing to injure their value as fuel if he thoroughly presses them; but he likewise becomes dependent on the weather in a manner that one would hardly, at first, have thought of. As soon as the cane juice is obtained it must be at once heated, and evaporation commenced, or fermentation will take place and the Sugar will be lost; hence the mill is not set at work for the extraction of the juice, when the weather is showery, because then the megass could not be dried, and there would not be fuel to heat the juice! This arrangement can only be

carried on in fine dry weather, when a few hours' exposure to the hot sun is sufficient to render the megass dry enough to burn. Speaking of this most wasteful practice, Mr. Wray says, "Often from 50 to 80 acres of canes are fit to cut, and even a portion spoiling, when rain sets in, and effectually prevents the cane trash being dried; consequently the mill must be stopped, however disastrous the delay may be. Sometimes the planter keeps a number of men working near the mill-yard on purpose to house the trash in case of a sudden shower. A bright sun is shining, of which he takes advantage to spread out his trash; a cloud threatens, and in a moment all hands are called; a few drops fall, and the cloud passes off; it is a false alarm, and the people retire to their employments. Again another cloud, and another gathering, only to disperse as before, for the cloud has passed. But once again it threatens; a few drops fall; all hands are called in haste; they run from every point, but, alas! too late. Every sugar-boiler, every domestic even is pressed into service, but all in vain; the rain comes down in torrents, and in a few moments the trash is as thoroughly soaked as if it had been steeped in a pond. As a few days' sun are required to repair this mischief, the mill stops; the cane-cutters are put to other work, the manufacture is suspended, and injury in many respects done to the estate." It seems hardly possible to imagine a more ill-arranged system of things than this; but, if it is almost surprising that the manufacture of sugar can be profitably carried on in such a slovenly and imperfect manner, our surprise must be increased when we remember that all this may be easily prevented by the importation of fuel, and by adopting such other expedients as may render the sugar-manufacturer independent of megass as fuel. The real obstacle would appear to be, not the difficulty of providing him with cheap and abundant fuel, but rather the prejudice in favour of old custom, which makes him regard the method of his predecessors, however inconvenient and expensive, as incapable of improvement, and leads him to consider all alterations as necessarily leading to loss and ruin.

Though, generally speaking, a large quantity of the sweet juice of the cane is lost in the manner above mentioned, the pressers sometimes, anxious to obtain as much fluid as they can from the cane, press the lower part as well as the green tops, together with the ripe part of the cane. This, which appears to be chiefly done in the case of contract work, is a most mischievous custom; it is even worse than pressing together ripe and unripe canes, but it leads to the same evil consequences. The lower part of the cane contains a good deal of sap, it is true, but it is generally more or less decayed and worm-eaten, contains very little sugar, and is usually sour; the juice, therefore, which it yields in the mill, so far from being of any value, or adding to the produce of sugar, serves merely to adulterate it, and increase the labour of purifying it, rendering it even more prone to change and spoil than it naturally is. The juice of the green tops, though perhaps not already in a state of incipient decomposition, like that of the lower part of the canes, contains very little sugar, and a large quantity of impurity. It may be laid down as a general rule that the purer the cane juice is, and the more sugar it contains, the easier will be the manufacture of sugar from it, and the less loss will it sustain in the process of evaporation and concentration. It has been already stated that the average quantity of sugar in cane juice is about 18 per cent., but in mills where only ripe cane is crushed, and where some care is bestowed in its selection and management, juice containing fully 22 per cent. of sugar is obtained, and it has occasionally been procured containing as much as 25 per cent., or one quarter of its weight, of sugar.

In the ordinary mode of manufacturing sugar, those physiological principles on which the formation and secretion of sugar depend are often recklessly set aside; a result of prejudice, ignorance, and the want of a little consideration. It is doubtless true that a great many of the evils which tend to depress this very important branch of colonial manufacture, arise out of the manner in which the sugar estates are too often managed, or rather mismanaged; the arbitrary power of the agent or attorney being quite independent of the real interest of the estate, and indeed very often leading him to do the worst possible things; a fact which is rendered still more fatal in its results, because it is no one's interest to point out the evils, or suggest a remedy to those most concerned, and best able to correct such abuses. Some of these effects are well exposed by Dr. Evans and Mr. Wray.

The juice of the sugar cane is a solution of sugar, in water, containing a small and variable quantity of other organic substances, which usually does not amount to more than about one hundredth part of the weight of the sugar itself. These substances are necessarily regarded as impurities by the sugar manufacturer, their rapid and complete separation is the chief object which he has in view; and, in fact, the whole operation of sugar-boiling may be said chiefly to depend on the separation of the azotised matters which the cane juice naturally contains. Remembering the object for which sugar is formed by the cane, namely, to assist in the future growth of the plant, and bearing in mind that before cane sugar can contribute to the growth of a plant, it must undergo a certain chemical change and pass into the state of grape or uncrystallisable sugar, it is not difficult to perceive the office of the azotised matters which the cane juice contains. Referring again to the composition of a seed, we see that in it a quantity of starch is deposited, to serve as food for the future embryo plant; but as a plant is unable to feed upon that substance in its ordinary and insoluble form, means must also be provided to ensure the conversion of this insoluble starch into soluble grape sugar, &c., at the proper time, when the seed begins to germinate. These kinds of changes are always effected in plants by the presence and agency of azotised matter. It is the peculiar office of those singular substances, gluten and albumen, to cause the conversion of the various forms of organic matter into each other; and it is always found that when any substance is elaborated and stored up by a plant for future use, if the matter so deposited is in an insoluble or inactive state, a portion of either gluten or albumen is formed at the same time, ready to act as a ferment whenever it may be required, and able with facility to bring the non-azotised substances with which it is associated, into a soluble and active condition.

The chemical nature of gluten and albumen, for they closely resemble each other in some respects, is very remarkable; it may be very well studied in the germination of a seed. The starch which the seed contains is brought into a soluble state by the action of the diastase or decomposing azotised matter which is associated with it. So long as the seed is dry, and the ingress of air is prevented, the azotised matters remain perfectly quiescent, and are unable to act on the starch; when, however, the seed is placed in those conditions which are favourable to germination, the seed becomes softened, air gets admitted, the azotised matter is oxidised and begins to change, and then acquires the power in turn of acting on the starch, in the manner of a ferment, and causing its conversion into soluble matters fit for the nourishment of the young plant. In all cases, however, where azotised and non-azotised organic matters are associated together, no change can take place, without the influence of atmospheric oxygen. The formation of Raisins and similar dried fruits illustrates this fact well. Grapes contains sugar and azotised matter, but so long as the latter is protected from the action of the air, it undergoes no change; when the Grapes are crushed, and thin juice comes in contact with the air, the azotised matter immediately begins to decompose, and the whole juice is soon in a state of fermentation. So long as the skin remains entire, the azotised matter is inactive; the fruit may be dried, but no chemical change takes place. Fruits of all kinds are injured and begin to decompose, as soon as they are bruised, or their skin punctured. This effect is mainly caused by the influence of atmospheric oxygen on the gluten and albumen which they contain.

Now precisely similar effects may be observed in the juice of the Sugar-cane; so long as the azotised matters which the cane contains are protected from the action of the air, they remain inactive, and undergo no change. As soon as the juice is expressed, by passing through the mill, the soluble azotised matters which exist in the cane, are brought in contact with the air, oxidation commences, and they are directly able to act on the sugar, inducing a kind of fermentation, and, consequently, causing the destruction of a portion of the sugar which the juice contains. In speaking of the composition of cane-juice, and the quantity of sugar obtained from it, we sometimes find it stated that it yields so much crystallisable sugar, and so much molasses, or uncrystallisable sugar; it is important to bear in mind, however, that the whole of the sugar formed by the cane, and which exists in fresh cane-juice, as it runs from the mill, is in the state of pure cane or crystallisable sugar; the molasses obtained during the evaporation of the juice, is not uncrystallisable sugar which originally existed in the cane-juice, but is entirely formed during that process, and results from the destruction of a proportionate quantity of crystallisable sugar, consequent on the presence of "ferment," exposure to too high a temperature, and other defects in the manufacture.

It is obvious, then, that the sugar-boiler should be well acquainted with the nature and properties of the azotised matters of the Sugar-cane, and should know the manner in which different substances act upon them, especially in increasing or diminishing their tendency to change. It is to be regretted that upon this very important point, the information placed before them is for the most part very defective. Mr. Wray, for instance, who has entered into considerable details respecting the concentration of its syrup, has evidently but a very imperfect knowledge of the chemical nature of these substances; and this renders all his subsequent reasonings and theoretical deductions of comparatively little value. Thus he confounds together under one name, gluten and albumen, observing that the planter will be pleased to learn that they are "one and the same substance;" a statement which necessarily leads him into a variety of difficulties, as he has subsequently to explain the coagulation of vegetable albumen by heat, which is a very simple and intelligible effect, as being the precipitation of gluten, in consequence of the expulsion by heat of some volatile acid which previously held it in solution. It is enough to mention this error, and to add that the author speaks throughout of gluten containing nitrogen in the form of ammonia, which may be expelled from it in various ways, to show that we must not expect much chemical assistance from him, in explaining the operations or removing the difficulties of the sugar manufacturer. When gluten, or albumen either, decomposes, ammonia is formed as one of the products of its decomposition; nitrogen is a necessary constituent of both these substances, but they cannot contain ammonia. When scientific terms are incorrectly employed in the explanation of any subject, their use does more harm than good.

The fresh juice of the Sugar-cane is, as may readily be supposed, extremely liable to undergo chemical decomposition, and there are several distinct changes or modifications which may take place; all in the first instance depending on the presence of decomposing azotised matter. The first of these changes is the viscous fermentation, a portion of the sugar passing into a kind of gum, the juice becoming turbid and ropy, whilst at the same time it loses its sweetness. This change seldom proceeds long alone, before a second fermentation is also brought on; this is either the lactic, or the vinous and acetous fermentation; the one resulting in the formation of lactic acid, the other in that of vinegar or acetic acid; but in either case the resulting acid is formed at the expense of the sugar of the juice. The cane juice is either allowed to run from the mill into a cistern or cold receiver to settle, or as is, in fact, generally the case, it is at once run into the clarifier, a large flat circular copper, holding from 300 to 500 gallons of juice. In this the juice is rapidly heated to about 140°, when a small quantity of slaked lime, or milk of lime, is added. The exact time of adding it, the mode in which it is added, and the quantity used, is very variable; it depends in part on the quality of the juice, and the sugar-boiler judges for each operation how much lime will be required. The whole is then well stirred up, brought nearly to the boiling point, when the fire is extinguished; a thick scum forms on the surface, a quantity of impurities subsides, the liquid becomes clear, and is then drawn off into the principal copper or boiler.

In these preliminary purifying operations, a number of different objects have to be attained; not merely are various insoluble substances which the juice always contains to be separated, but at the same time various other vegetable principles, previously in a soluble form, are to be rendered insoluble and precipitated. As may be expected, from the mode in which the juice is obtained, it always has a small portion of the woody fibre and cellular tissue of the cane diffused throughout it; a portion of this subsides when it is allowed to remain in the cold receiver, previously to being run into the clarifiers; but the juice can never be wholly cleared by standing; and, besides, it is desirable to bring it to the clarifiers as quickly as possible, so as to prevent the chance of loss from the commencement of fermentation. If these substances were the only impurities contained in the juice, they might certainly be removed by filtration, but they are in fact only of secondary importance, as compared with the azotised matters which are in a soluble form, and the decomposition of which would be considerably accelerated by any operation that would cause the juice to be more fully exposed to the atmosphere. It is of the first importance to proceed with the purification and evaporation of the cane juice as rapidly as possible, not merely because the longer the juice is suffered to remain exposed to the air the greater danger is there of its being injured; but also because, as the crushing of the canes goes on, the mill continues to supply a large quantity of juice, and it is therefore necessary that the receiver and clarifier should be quickly emptied, in order to make room for the fresh juice as fast as it is pressed out. The sugar-boiler in the first place endeavours to separate the azotised substances, because they are the most important impurity of the juice, and because their precipitation causes the immediate separation of all the other impurities, which are mechanically suspended in the cane juice; they act in fact like the clarifying liquid, or finings, used in the manufacture of wine.

Miscellaneous.

Locusts in Savoy.—On the 25th of June in the present year some locusts appeared in Savoy; they were at that time without wings, or, in other words, in the larva state, which tends to confirm the observations of certain gentlemen, who assert they saw them in small numbers last year. The larvæ observed towards the end of June covered the right bank of the Isère, about 500 yards from the village of Po, near the town of St. Pierre d'Albigny. They advanced slowly, and spread over the gravel and rugged stones of the bank, swimming across the pools and water-courses which they encountered. They remained here about three weeks; they then underwent their last transformation, and acquired wings; they subsequently dispersed after a severe storm which occurred on the 22d of July. On the 2d of August some were picked up at Chambéry, and on the 4th they were found even at Aix. On the 26th of July, when MM. Génin and Bonjeau first observed them, they were nearly all winged; there were but few larvæ. They were dispersed over the right bank of the Isère, covering a space of from 3000 to 4000 yards long by about 500 wide. The earth passed over by them was strewed with their excrements, which, in form and colour, resembled grains of corn. A chemical analysis of the excrements showed them to be composed of the woody matter of the plants over which the insects had passed. The damage done is fortunately not great; it is estimated by MM. Génin and Bonjeau at one-half of the marsh plants, one-hundredth part of Maize seed, and one-twentieth of the leaves of the same plant; other plants suffered little. The locust appears to be the Œdipoda migratoria; it has not been known to have visited Savoy before. The specimens of it to be found in the Museum of Natural History of Savoy were obtained from Algiers.—*Comptes Rendus.*

Grape Mildew.—With respect to the memoir of Dr. Marie (published in the "Comptes Rendus" for last September, and translated at our p. 613), on the disease which attacks Grapes, M. Guérin-Méneville observes that it is incorrect to suppose that the species of fungus which grows upon several different plants (Pansies, Rose-trees, Sainfoins, Sinapis, Polygonum, Vines, &c.), is in every case one and the same individual. According to the observations of the latter gentleman, made for a period of years in the south of France, the fungi which attack certain plants and mildew them are not in every case identical. He has had occasion to study a disease of Sainfoin, completely analogous to that of the Vine, but it was found to be caused by Oidium erysiphoides (Fries), which is different from O. leuconium and O. Tuckeri. M. Guérin-Méneville never saw O. erysiphoides on Grapes, although some beds of diseased Sainfoin were in contact with rows of Grapes. M. Marie adds to the list of plants attacked by O. leuconium previously given by him, the following: Plantago major, Scandix pecten, Polygonum aviculare, Ranunculus philonotis, Lamium album, L. purpureum, Ballota nigra, Sinapis nigra, Erysimum officinale, Thlaspi Bursa-pastoris, Pisum sativum, Tragopogon porrifolium, Cucurbita Pepo, Cucumis sativus, Acer Pseudo-Platanus.—*Comptes Rendus.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Orchidaceous Plants.—To assist such of these plants as have completed their growth in going quietly to rest, the atmosphere of the house should be kept gradually cooler; or perhaps it will generally be more convenient to remove them to a cooler house. A situation something like that in which Cactuses are wintered will be very suitable, taking care, however, never to allow the temperature to fall below 45° for general species. Some few will endure a lower temperature uninjured, but these are exceptions. At the same time excess of damp must be studiously avoided by carefulness in watering, and by admitting sufficient air to dry up and expel the superabundant moisture. Let the roof-sashes be made perfectly clean, that the rays of light may be impeded as little as possible; but while the house is under cool treatment in winter it is not advisable to allow the tender species to hang too near the glass, as the temperature there is more liable to variation, and the foliage of the evergreen varieties is often injured thereby. Let drip be carefully guarded against, for if it fall upon the roots of the plants, it will injure, if not destroy them; or it will excite them into growth, which is scarcely less objectionable. Dendrobiums, Renantheras, Cœlogynes, &c., should now be removed to a cool dry house, to prepare them for flowering. Any plants which are unfortunately producing young growths out of their natural season should be placed at the warmer end of the house, but the temperature even there must be very moderate, as the object is not to stimulate them, but merely to keep them in such a state of gradual progression as shall prevent their perishing.

FORCING DEPARTMENT.

Pineries.—Furnishing bottom-heat by means of hot water has made the management of Pines during winter so simple a matter, that a very brief space will suffice to give all the necessary directions. The moderate bottom-heat required to keep them in a gentle growing state, and top-heat, laden with any required degree of moisture, and sufficient to allow of the free admission of air, are given with equal facility. The amount of moisture raised within the pit must never be very great at this season, and the slightest excess in this respect must be carefully guarded against during dull or foggy weather. Where dung, leaves, and tan are still the materials employed to furnish the necessary amount of top or bottom-heat, the impossibility of suddenly increasing or decreasing its power, according to the particular requirement of the weather, render it a necessary precaution to keep up a stronger heat than is generally wanted, and to moderate it in warm weather by a freer admission of air, that there may be less difficulty in keeping up the temperature when a sudden change takes place. In pits where such means are used, air, by back ventilation, must at all times be more liberally furnished, to allow the exhalations to escape. When there is evidence of a decline in the bottom temperature, let a little fresh tan be pushed in amongst the pots, and even over their rims. In such cases it is often necessary to remove a portion of the old surfacing material, before the new is put in. These matters must be done by very careful workmen, without going amongst the plants, that the leaves be not damaged; for nothing is more injurious to the health and appearance of the plants than mutilating their foliage.

Forcing Pits.—Insure a sufficient supply of Rhubarb, Seakale, and Asparagus, by introducing successions at regular intervals, according to the supply required, and the quantity of plants to meet it. In selecting Seakale plants, take those first which showed the earliest indication of ripeness, by casting their foliage. If a frame or pit with glass lights can be spared for Asparagus, it is much more tender and delicate than when grown in a dark place; they should, therefore, when their shoots appear above ground, have all the light and air possible. We force this favourite vegetable in frames, which, during summer, are occupied by Melons. The bottom-heat, produced by hot-water pipes, is turned on very moderately at first, and afterwards gradually increased, after the roots are fairly in motion. A portion of the stock of these three vegetables should be mulched over with some decayed litter as soon as possible, that the natural warmth of the earth may be retained, and the roots thus kept in action; and also that they may be lifted at any time, as the mulching will prevent the ground being frozen.

FLOWER GARDEN AND SHRUBBERIES.

All possible advantage should be taken of the few shrubs which flower during winter, such as Laurustinus, Erica carnea, Polygala Chamæbuxus, Menziesia, and others. The display may be materially assisted by a judicious selection of variegated plants, the gold and silver tints of which contrast prettily with the general dark green, and at a short distance they may easily be mistaken for flowering plants. Early flowering herbaceous plants may be planted near the outsides, and still nearer to the edge belts or patches of Hyacinths, Tulips, Crocus, and other bulbs may be planted. We presume the reserve garden contains, amongst other useful stuff, a nice stock of Wallflowers, Primroses of various colours, &c.; these should be made the most of. The bulbs should be planted very near the outside, and when in patches the places should be marked with stout pegs made of Oak lath; these precautions will render them less liable to be disturbed when the operations of digging or forking, planting or removing, are going on. In addition to the above, we make use of a choice selection of hardy evergreen shrubs, such as Rhododendron ponticum, Pernettya mucronata, Gaultheria, Tree Box, &c. These are removed with good balls of earth, and in spring are returned to their places in the reserve garden. In addition, we take care to have a constant succession coming on of various sizes, so that when any of them are grown too large for the purpose they are finally planted out in appropriate clumps.

FLORISTS' FLOWERS.

The florist's labours are now becoming comparatively light. Tulips safely bedded; Dahlias out of the ground, properly labelled; Carnations and Picotees potted off, and in their winter quarters; Auriculas and Polyanthuses taken equal care of; Pansies and Pinks planted in the situations where they are to bloom, with others in pots as a reserve for any casualties which may occur in the winter; all this would be the result of the amateur's labours, if attention has been paid to our repeated cautions. We hope such is the case, and we must further observe that now regular attention must be paid to plants in pots; the labour is not much; it is regularity that is principally required in looking after their necessities. For instance, it is possible that the drainage of an Auricula pot may be defective; this, if not immediately seen to, will endanger the health of the plant. Another may be immediately under "a drip;" this is a serious matter, and must be remedied; whilst Pinks or Carnations may be taken by wireworms, which, if not caught, may make sad havoc. In fact, every day brings with it its cares and attentions. We must not forget to add that the soil should be well manured and trenched where the Dahlias have grown. This will be highly beneficial, and should not be lost sight of. The stakes, as well as the sticks used as supports, both for them and Carnations, should be repainted before stowing away.

KITCHEN GARDEN.

If Cardoons and Celery have made any growth since they were earthed up, they may be gone over again, and a little more soil drawn up round the collars of the plants, to assist in blanching them, and in preserving them more effectually from the frost. In bad weather, the labourers may be usefully employed in manufacturing birch-brooms, baskets, &c., cleaning out seeds, and sorting and storing roots. Give frequent attention to the Potatoes in pits and heaps, and remove immediately any which show symptoms of decay. In fine warm weather, it is well to open the heaps, and allow the pure air to circulate freely amongst them.

HARDY FRUIT GARDEN.

We may reasonably suppose, that there are no very pressing operations in the kitchen garden just now, since the root crops are all gathered, except the Parsnips and Leeks, and there are no crops to be sown or planted, excepting the Potatoes; presuming also that the crops of Celery, Brassicas, &c., are all properly earthed up, it allows of a very considerable force being directed to the important operations, which require performing in the fruit-garden. The wall-trees are generally considered most important, and of these we will speak first. The operation of training is performed with greater ease and comfort, and, consequently, with much saving of time, if commenced early in the season, so that the best weather may be devoted to it. The first operation is to loosen the trees from the walls, and, if it be admissible, the latter should have a coat of colour, that all insects and their embryo may be smothered; otherwise they may, at least, be well washed with clean water from an engine. If nails and shreds are used, let the former be made hot, and dipped into linseed oil, for the double purpose of destroying insects, and preventing rust; and let the best of the old shreds be boiled, washed, and dried, previously to being re-used. Those who intend to apply the method of using fixed studs, and tying the trees to them with bass matting, will of course take this opportunity of doing so. Where the common nails and shreds have been long used, it will be necessary to rake out and re-point all the joints; the studs are then to be fixed in at suitable distances, and the wall is ready for retraining. At the same time, let diseased trees and inferior varieties be removed, and after carefully preparing their stations let better, plants from other parts of the garden, or young trees from the nursery, be planted in their stead. By carrying on these operations together, a larger number of labourers may be usefully employed, thus keeping the force together. The handier men will of course be selected for that part of the work which requires the greatest care and dexterity. Previous to the trees being retrained, they should be washed over with the following mixture, to destroy any insects with which they may be infected. To one gallon of water, add a quarter of a pound of soft soap, and half a pound of sulphur, with sufficient lime and soot to give it the colour and consistence of lead-coloured paint. For Pear trees infected with scales, some tobacco liquid should be added to the mixture, which should be laid on quite hot.

State of the Weather near London, for the week ending Nov. 7, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Arboretum: *G.* We believe that Messrs. Whitley and Osborn, of Fulham, can supply any plant named in your list. Their prices are reasonable.

Books: *J R M.* Bevan on the Honey Bee.

Bulbs: *W F S.* We know no one better able to supply you with bulbs than Mr. Bernard Saunders, of St. Helier's, Jersey. The favourable climate of that island gives him facilities which cannot be found in England.

Dahlias: *J C.* After taking them from the ground, cut the stems rather close in and place the roots crown downwards for a few days, in order to drain the water from them. When dry, put them away in a cellar, or under the stage of a greenhouse. In spring they may be divided into as many parts as there are "breaks." With a view to ascertain the number of eyes, place the roots in heat for ten days or a fortnight before you divide them.‡

Gas: *Z Z.* Do not attempt to use gas in a greenhouse. It is expensive and dangerous, and ruins the plants. Use coke, or coal, or some such fuel.

Gravelling Walks: *A B.* Shell gravel never binds well if laid on thickly. It should be spread thinly, and evenly raked and well rolled. It is better to give two thin dressings in the year than one thick one.‡

Japan Lilies: *Amateur.* You had best plant them in flower-pots. Keep them during winter in a cold frame, and transplant them to the open border in spring.‡

Moss on Lawns: *Reader.* You cannot, perhaps, do better than follow the directions for its extirpation, given at p. 439 of our volume for 1848 ‡

Names of Fruits: *W H I.* 1, Beurré de Capiaumont; 2, Passe Colmar; 3, Ne Plus Meuris; 5, Seckel; 6, Belle et Bonne; 7, Winter Pearmain. Some of the best Plums for standards are the Royale Hâtive, Greengage, Washington, Kirke's, Jefferson, Reine Claude, Violette, and Coe's Golden Drop. Cherries: Mayduke, Knight's Early Black, Elton, Bigarreau, Late Duke, and Florence.‖—*G E.* 1, 8, Passe Colmar, 2, Beurré de Capiaumont; 3, Beurré d'Aremberg; 4, Napoleon; 5, Winter Nelis; 6, Easter Beurré; 7, Glout Morceau; 9, Beurré Rance.‖—*J Everiss.* Your Pear when received was considerably decayed. It is probably some Perry Pear, unknown to us.‖—*G Bennett.* 1, Chaumontel; 2, Beurré Rance; 3, Ne Plus Meuris; 4, 7, 9, Glout Morceau; 5, Marie Louise; 6, 10, Beurré Diel; 8, Easter Beurré; 11, Passe Colmar; 12, Louise Bonne (of Jersey); 16, Brown Beurré; 17, Knight's False Monarch, regraft it; 18, Beurré d'Aremberg; 19, Vicar of Wakefield; 20, St. Germain.‖

Names of Plants: *Henry.* We are sorry to disappoint you, but we really *cannot* undertake to name pieces of leaves, or leaves without flowers. 2 is Cotoneaster microphylla, we suppose.—*Keith.* Clethra alnifolia.—*Vitis.* Lastrea spinulosa. *S.*—We are obliged again to request that correspondents will not send us plants to be named unless they are in flower. We are happy to pay any reasonable attention to the requests that are made to us; but there must be a limit to the time which can be devoted to this or any other department of our office. We therefore beg "U. X.," and a "Young Gardener," to receive this as a reply to their inquiries.—*Chas F P.* We will examine them, and report next week.

Nursery Catalogues: The Editor would be glad to receive these from as many nurserymen as chance to see the present notice, unless they have already forwarded them.

Paulownia Imperialis: *Addio.* Although hardy this does not flower in England—apparently from a deficiency of summer heat. It grows too fast, but as it becomes older may be better behaved.

Pelargonium Leaves: *Lover of Flowers.* They are affected by the "spot," a disease caused by cold and damp.‡

Roses: *H.* We do not perceive anything unusual in the bud with which you have favoured us. It appears to be the same as other double Roses.

Salt Hill Dahlia Show: *S W B.* We confess the oversight. Can you assist us in rectifying the error?

Misc: *J P.* There are no varieties of Humea elegans.‡—*Tamworth.* It is of no consequence whether you pick off the yellow leaves in autumn from Peach and Nectarine trees or not. It is a good plan to paint over the trees in spring with the wash recommended by Mr. Paxton. It is in no way injurious to the trees.‡—*E F L.* Much obliged, but we do not at present want the Numbers. "Paul on the Rose" you can procure through any bookseller.

SEEDLING FLOWERS.

Pansies: *A W W.* It has a good dark eye, and is otherwise promising. It should be grown again.*

Pelargoniums: *X Y Z.* An improvement on Luceum roseum.*

DR. S. NEWINGTON'S IMPLEMENTS OF AGRICULTURE.—These Implements have been invented to introduce an improved system of cultivation, and a more scientific method of depositing the seed. A Prospectus and Lecture on the different methods may be obtained (gratis) by applying to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red Lion-square, London.

SMITHFIELD CATTLE SHOW.

NOTICE.—THE PRINTED FORMS OF CERTIFICATES to be filled up for STOCK and IMPLEMENTS intended to be exhibited at the forthcoming Show in December next can now be obtained of the Honorary Secretary. All such Certificates must be returned, properly filled up, on or before **Saturday, the 16th of November.**

In applying for the Forms for Stock, it is necessary to state the Number of the Class or Classes, as there is a separate Form for each Class.

Prize Sheets and all information can be obtained on application to B. T. BRANDRETH GIBBS, Hon. Sec., corner of Half-Moon-street, Piccadilly, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No."

"Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.

SATURDAY, NOVEMBER 9, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Nov. 14—Agricultural Imp. Society of Ireland.
THURSDAY, — 21—Agricultural Imp. Society of Ireland.

WE have to remind our readers of the two great December AGRICULTURAL MEETINGS—that of the Smithfield Club, which has so long been influential for good upon the breeding and feeding of cattle in this country, and that of Birmingham, which last year entered upon a similar course of usefulness for the Midland Counties. The former exhibition will take place, as usual, in the Baker-street Bazaar; the latter, in the new Bingley Exhibition Hall, a permanent building erected for this and other similar public purposes. Those who intend to exhibit must, before this day week, have furnished the secretaries of the two societies with certificates regarding the age and nature of their stock, forms for which are to be had on application to MR. GIBBS, at the corner of Half-moon-street, Piccadilly, for the Smithfield Club, and of MR. WRIGHT, Union-street, Birmingham, for the Birmingham show. Those who desire that their stock should compete only with others of a similar breed, will prefer the latter; those who are disposed to support the only opportunity which remains for competition between the breeds, may prefer the former. There is, however, little need that we should claim for so time-honoured an institution as the Smithfield Club the support of agriculturists; its popularity is not likely to fail; and we would therefore the more anxiously impress upon them the usefulness of helping to establish the Midland Counties Exhibition at Birmingham. It is much to be desired that those who have the means of adding to its attractiveness, will not fail to apply to MR. WRIGHT for forms of certificates for Cattle, Sheep, Pigs, or Poultry, during the ensuing week.

IN a late Number of our Paper we took occasion to remark on the failure of the attempts hitherto made to apply the LIQUID MANURE OF THE FARM in an economical and beneficial manner. We have since had occasion to inspect a large farm, provided with a manure tank, thus giving an excellent opportunity of observing the practical value of this and other schemes, which were to work such a revolution in modern farming.

The farm-buildings, to which we refer, have been erected at the cost of 8000*l.*, and are, we believe, some of the handsomest and most complete in Great Britain. A steam threshing-machine, with stones for crushing corn, was at full work when we visited the farm. The fold-yards and cattle-sheds were the picture of comfort and cleanliness; plenty of clean straw and a good supply of water in each. Indeed, the only objectionable part of the whole arrangement, according to the tenant, was the stable for the cart-horses. It was slate-roofed, without loft or ceiling, and we were informed by the farmer that he found it impossible to keep his horses in health, the stable was so chilly, notwithstanding it contained nearly 20 horses. The first winter the stables were used, 12 horses went blind, and we remarked that the whole of them had very rough, staring coats.*

We observed also that, though provided with a boiler, &c., the Turnips for the cattle were not steamed—they were not even cut. That the tenant was amply provided with capital and means, as well as intelligence, enough to have adopted these modern improvements, if they had been found profitable, we are perfectly certain. Are we then to conclude from their non-adoption that, in this respect also, the improved arrangements for cattle-feeding are more expensive, but not more effectual than those commonly used? Or are we to believe that here, also, habit has been more powerful than reason?

Another thing that struck us particularly was the method adopted of draining the farm buildings. Each fold-yard *sloped* to one corner, where there was a drain, leading to a main conduit, connected with small drains from all the stables and cow-houses, and terminating in a manure tank, capable of containing some thousand gallons. We found, upon inquiry, that the manure tank, as far as its original construction was concerned, was useless. After careful and anxious trial the carriage of the liquid manure on to the land was found to be so costly, and the benefits produced so small, that *it was now carted on to the nearest dunghill.* We have far more faith in such a result, as deduced from the extensive practice of a farmer, than we have in the theories of men who are more ready to teach others than capable of practising what they teach. Nothing can be further from our intention than to undervalue the importance of saving the liquid manure of our farms; and the common plan of allowing the liquid excrement to run into the pond where the animals drink, must be held to be an abomination and a disgrace. But is there no medium between the wastefulness of the one plan, and the costly saving of the other? In certain situations, where a great number of cows are kept, producing more liquid than can be absorbed in boxes, a manure tank may be useful.

But the farmer was also provided with a hay cutter, worked by the steam-engine. This also we found had been disused since the first year; the tenant informing us, greatly to our surprise, that when he used it, an additional man, costing 30*l.* per annum, was required, an outlay which more than counterbalanced any saving that might be effected.

The tenant reported favourably of the plan of crushing the Oats for the horses, a smaller quantity being required.

Our visit afforded matter for serious reflection. The multitude of suggestions for the advancement of agriculture which have made their appearance within the last few years, show that public opinion on these matters is in a very unsettled, as well as in a very anxious state. The greediness with which nearly all these suggestions have been more or less adopted into practice, is perhaps the most striking part of the subject; it shows either that farmers are improving in intelligence, or that they are moved by a pressure unknown in previous times, or perhaps both these causes are in action. Whether or not, in no previous portion of the history of agriculture has there been such a straining after improvements as we have witnessed within the last few years. It is therefore to be regretted that either many of these so-called improvements have turned out upon trial to be the reverse of what they promised to be, and the disappointment resulting from their failure will consequently render many less willing to adopt what may hereafter be discovered to be really valuable; or that tenants have not yet given them that full and perfect trial which might be claimed for them.

To a certain extent there is no doubt but that a manure tank, an apparatus for cooking food for cattle, and a hay-cutter may be useful. It is the over-estimate which their advocates have formed of their value that we complain of—it is their abuse and not their use that we find fault with.

In many instances the persons who urge the immediate adoption of these improvements resemble a child with a toy; they are everything for the moment, to be at once flung aside at the suggestion of something new. In this way more than one matter has passed from the recollection of these agricultural improvers. For instance, we never hear the subsoil plough spoken of now, though we entertain the highest opinion of its value when judiciously used. In like manner many really useful suggestions have been forgotten, through the disappointment which followed the extravagant idea of their value entertained by those who originated them.

The latest form which this search after novelties has taken, is the cover for the manure heaps. It would certainly be useful to provide such accommodation, but is a cover for the dungheap the first requisite of the present day? For instance, before providing such a building, would it not be advisable to provide permanent sheds for corn and hay? The plain practical utility of such a suggestion has, we fear, little charms for the advocates of covered dunghills. Plans of farm buildings have already been published with the latter duly marked, but we have never yet seen a hint of the former, though we certainly think that shelter for corn ricks is a much more important matter than a cover for the dunghill. *C*

* The result may have been owing to the previous habit of treatment to which the cattle had been accustomed. Our stable is pantiled "without loft or ceiling," and we have had 11 horses in perfect health for many years in it.

THE WARP LANDS OF LINCOLNSHIRE.

SOME years ago the public regarded this county as a foggy, flat expanse of wet marshes and miry fens; a land of cramps and agues, tenanted by wild ducks and decoy-men, and for ever discordantly vocal with the cries of plucked geese. Latterly, however, by reason of railways and the press, both the travelling and reading portions of the agricultural world have discovered that Lincolnshire has Heath and Wold hills as well as damp and dead-level lowlands; that it is also healthy and well cultivated; light has dispersed the thick cloud which hung over this part. Its farmers have risen into the first class for the magnitude and diversity of their enterprises, having defended so large a portion of their county from the sea, which is on a higher level, and executed stupendous works of drainage; having converted the very stone of the bleak hill ranges into rich corn-bearing earth, and hid the barrenness of their northern plains under a coating of most fruitful soil. But though they have subdued so much that was aggressive, and tamed so much that was intractable and profitless, there are still some districts of land in North Lincolnshire lying almost beyond their powers of amelioration, utterly worthless and incapable of production. To the north of Gainsborough, several miles east of the river Trent, may still be found wild "commons" and "warrens," in some localities so barren as to produce nothing but white Moss, in others partially belted with plantations and surrounded by patches of Turnips and Barley. Light-blowing yellow sand may be seen drifted into heaps after a gale; and hundreds of acres of this dry loose soil now lie in bare heaps or Fern-clad patches. Sometimes the higher portions of such a moorland will be completely matted by Mosses and Heath, rough with larger vegetation, such as tufts of black Rushes and bunches of Furze, the lower parts boggy, with water-courses and stagnant plashes. The few half-starved beasts and sheep which graze on it in summer must have great difficulty, both in traversing its tangled heath and boggy rivulets, and in finding provender. It is a sudden blow to the feelings of an agriculturist when he enters upon one of these dreary moors, lying, as they mostly do, between the well-tilled limestone, &c., on the east and the fertile warp land on the west, the sudden contrast from either approach is between prolific exuberant cultivation and a blasted scene of blankness and sterility. I crossed one of the warrens on my way to the warp district. It

was a wide bleak flat waste (though on a much higher level than the land I was going to view), without trees or bushes, and covered with black Ling. It was in the spring; and I had a far view over many hundreds of acres fed by black rabbits, the surface clad with Ling and dead Fern, the peaty sand hanging over the crests of the cuttings on the road-side like festoons of soot, and the whole region seeming as if scorched and scathed by fire. In the hollows of the low portion of the common were shallow runnels of water discoloured by the red running sand; I wanted only a stork to spread his wings here for flight and "pack up his legs like a fishing-rod," as described by "C. W. H." on his continental tour, to fancy myself out of the far-famed Lincolnshire, and travelling towards Berlin. But reaching the brow of the hill—the lias hill stretching northward from Gainsborough to the Humber—and facing the west, I looked down upon the great warp valley. From the foot of the hill a dull flat extended for a mile or two to the bank of the broad-flowing and sinuous Trent; and beyond this, stretching out for many miles, was the "Isle of Axholme," an immense plain luxuriant with pasture and rows of clustering foliage among its dark arable fields. Long lines of drains intersected the landscape, and bright angular spaces shone here and there where distant warping works were in progress.

The base upon which the warp soil rests is of peat and sand; for the process of warping consists not in running out permanent embankments into the water of the wide river or Humber estuary, and by such encroachments taking possession of soil deposited upon their bed, but in raising temporary embankments far inland from the stream, and abandoning the enclosure for a time to the will of the tides, the alluvium being thrown down upon the surface of land which has generally been already under cultivation. A strong, deep, and fruitful mould is thus imported and self-spread upon the broad level region of weak land. The foundation of sand belongs to the new red sandstone formation—gypseous rock and red marl appearing at Gainsborough, and occurring below the escarpment of the hill which ranges northward hence to the Humber, bounding the flat of sand, &c., at a few miles distance east from the Trent, and a ridge of the same beds rises a few miles on the western side of the river, in the Isle of Axholme. Upon the intermediate level of low sand once flourished a thick forest, now subterranean. Oak, Fir, Yew, and other trees, nuts, Acorns, Fir-apples, &c., are here found in great quantity. The trunks, branches, and stems lie prostrate, but the roots are in the attitude of growth, and the most delicate and intricate fibres of the roots extending from them into the sand forbid the supposition of their having been drifted here. Yet the surface upon which they grew is below the level of low-water mark in the Trent. Inundation appears to have overthrown these woods, and the tides and freshes formed a river channel at about the present course of the Trent. The timber and foliage decayed into peat, and this bed became covered with mud in the vicinity of the river channel, which is now found as a soapy blue clay. A portion of this clay, immediately adjoining the river, has more recently been overspread by alluvium or natural warp deposited by the overflowing waters, which of course became clearer of muddy particles, as they ran further inland, where no sediment has been left. That portion of the peat furthest from the stream, receiving no deposit, had no pressure to consolidate it; and bog plants vegetated in it, accumulating at last into a loose watery quagmire, several yards in depth. It is upon this peat that the warping is principally done. In that part of the plain which lies east of the Trent (about 15 miles in length by two to four in breadth, and to which this description chiefly refers), there is a belt of bare sand separating the peat from the front of the hill range before-mentioned; and this sand has in many localities drifted by the winds, forming hillocks upon the edge of the peat, and hiding beneath them the black trunks and roots of the ancient forest.

Descending into this district I crossed these beds in the following order of succession, on my way to the Trent bank:

EAST.

NORTH.	Hill of lias, limestone, and clay. Springs pouring down upon the flat of sand, peat, &c.
	Sand, light, loose, and either wet or hilly.
	Peat not yet warped. In some places are sand-hills too elevated for the process.
	Artificial warp, on a somewhat higher level than the peat. The stratum is 2, 3, or more feet thick upon peat and sand.
	Strong soil, being the buttery clay cropping out. The land slopes gently up the river.
	Natural warp, apparently on a dead level, but in reality varying several feet in elevation, being lower wherever bends of the river made the current strong, and higher where the flow was feeble.
	River Trent, 150 yards wide. Discharges northward.

WEST.

As respects the state of this tract previous to the warping, the sand land I could judge of by the remaining waste, which in the peaty places was producing nothing but Rushes, while the rest was golden with yellow-flowered Gorse; and of the peat I heard particulars, showing that, from the effects of drainage, the canty patches of it yet left are no adequate criterion of what it formerly was. The surface crust of vegetation was sufficiently solid to bear men walking upon it: this once cut through, a semi-fluid or pulpy mass was found, 6, 8, 10, or 12 feet in depth. Upon this bed of decaying vegetable matter (the plants becoming distinguishable as it was dried), floated the upper stratum of firmer peat, like as on the Irish red bogs, or the quaking Chat-moss, Ling, "Shar," or saw-edged Grass, Sedge, Water-flags, and Reeds many feet high grew upon the rotten soil, which was "graved" for peats—these being dried for fuel on the sand-hills, where waggons and horses could venture. When the work of reclaiming commenced, the moor boiled up along the bottom of the new cut drains; and, when the warping water was admitted from the river, rose up (like the "Floating Island" in Derwent Lake) and formed a dam before it. Men were employed to traverse the flooding tide in boats, and cut the swimming mass to pieces, which subsided when the water beneath was thus let out. It sunk into a thin band under the augmenting soil of mud, and has been found, in some places, compressed quite hard with the weight.

The process consists in admitting the tide at high water to deposit the warp with which it is loaded, and permitting it to run off again as the tide falls. A sluice is first erected in the Trent bank, a canal cut 1, 2, 3, or even 4 miles to the land intended for the improvement, and banks 3 or 4 to 6 or 7 feet high raised round the fields; then by using many tides, and properly directing the in-flowing flood-water over the surface, a mass of new soil is equably laid upon the former ground to the thickness of 2 or 3 feet. The effect is, therefore, very different from that of irrigation, for it is not the water that works the effect, but the mud; the business of warping ceasing in winter and in fresh water floods, as the warp is best and most plentiful during the driest seasons and longest droughts. Arthur Young, the first describer of the system, says, "It is not to manure the soil, but to create it. What the land is, intended to be warped, is not of the smallest consequence; a bog, clay, sand, peat, or a barn floor, all one, as the warp raises it in one summer from 6 to 16 inches thick; and in hollows or low places, 2, 3, or 4 feet, so as to leave the whole piece level. Thus a soil of any depth you please is formed, which consists of mud of a vast fertility, though containing not much besides sand; but a sand unique." He adds a note by a commissioner employed in warping, as follows—"Warp leaves one-eighth of an inch every tide, on an average; and these layers do not mix in an uniform mass, but remain in leaves distinct. The water must run perfectly off, that the surface may incrust; and if the canal is not empty, the tide has not the effect." It has not been customary to warp a whole farm or estate at once; but two or three fields (when the land has been previously under culture), are thrown together and embanked as one "compartment." This process may, therefore, be said to have occupied a place in the course of management until the whole farm has been thus treated. When once done, it is done for ever; but much of the land that was warped at the first onset being too hurriedly finished, is now too low, and is being flooded a second time. Some of the deeper peat has also subsided so considerably as to injure the drainage of the warp upon it, and several feet of soil have to be again floated upon the surface. Young makes the following statement: "Mr. Wilson's idea of warping is very just; to exhaust the low lands in favour of the hills, then to warp 6 inches deep to exhaust that to make the hills; then to warp again; and by thus doing to keep the warp land in the highest order, and at the same time work a great improvement to all the higher grounds." Warping successively was at first practised by some, but experience has shown that it cannot be profitably done. An intelligent warp farmer said to me on the tour being now described, nothing makes Twitch (Couch) grow like letting in the water; hence Mr. ——, mentioned by Young, got his new warp land full of Twitch; then warped a second time, then got more Twitch, &c., and soon made a muddle of it, and lost his money.

As I passed across what had been not long ago a watery morass, everything seemed to indicate a fruitful soil and prosperous cultivation. The sides of the ditches showed in section 2 or 3 feet of rich alluvial loam resting upon compressed peat; and while the upper well-drained soil exhibited its fertility in the bright green rows of healthy thick-set Wheat, which adorned the surface of nearly every second field, the black subsoil manifested its vegetative properties by the rank Reeds that shot thickly up along the ditch bottoms. Whitethorn hedges fenced many of the grounds; and around the comfortable farmsteads were plantations of Poplar, Ash, Birch, Beech, Lime, Chestnut, and Sycamore, as well as the water-loving Willow and Alder. The former presence of abundant moisture was testified only by the sickly or dead Larches and Spruce-Firs, which thrive upon the new earth until their roots strike the underlying moor, and then famish upon the poisonous food that wet mass contains.

Passing through one of the many Dutch-looking hamlets which cluster under the Trent bank—the tidal waters leaning against this barrier, and at intervals of some years occasionally overtopping it—I arrived at the mouth of one of the large warping drains. Here was a sluice, consisting of two flood-gates, pointing to the river so as to exclude the tides, unless held open for the purpose of admitting them. As the drain was then employed in warping a plot, the tides were suffered to play in and out at pleasure; the water is not held forcibly upon the land; for if so, the drain would silt up, and besides this, the back-doors that would be requisite to hold back the water could not be raised up with the head of water against them, and thus alternate tides would be lost. Keeping along the drain bank towards the works, I saw the water returning, as the Trent tide was ebbing; it was not clear, but of a drab muddy colour, having left only a portion of its sediment behind. It was curious to observe the rich clayey lands divided at intervals by small banks of sand like the fences of a rabbit-warren; the soil on one side of the bank being often 1 or 2 feet higher than on the other. A walk of about 2 miles brought me to the warping works, where 50 acres in one compartment were undergoing the process. And here it was still more singular to see horses and labourers at work with ploughs and other implements on one side of a fence, and a muddy-looking inland harbour on the other, whilst a little way off was a field just newly warped, its wet salt surface cut about with grips and glistening brightly in the sunlight through a tall "bullfinch" hedge. Good Wheat crops spread verdantly around; and Beans just "breaking cover" appeared in many fields and on the steep silty sides of the drain embankments. The compartment was not yet completely warped, part still remaining as dingy moor bearing Sedge and Bulrushes, and barren sand clad scantily with Heath and Furze. The greater portion was under water, shoals and flats of slime appearing here and there, clothed in spots with vegetation. A salt-marsh is here formed upon an inland tract of peaty sand, so there being a change of vegetation while it so remains, from arenaceous and bog plants to those that live upon the sea-shore. The spikey light-green "Water-grass" which shows itself upon the wet warp dies directly the water is shut off, so that then (as my informant says), "it may be pulled up easily like wool off the back of a rotten sheep." This new marsh land is then reclaimed by drainage, and good natural herbage and Clovers make their appearance, together with innumerable weeds never known before. As indicative of the *duality* of this region—being both moorland and marsh at one time—the snipe, who quits the marshes in the early spring, and seeks the sandy uplands, was still here; ascending high in the air, and curving downward again with quivering wings, so as to make that melancholy bleat which has here earned him the title of "the moor-lamb." The compartment was rectangular, and the warp water entering at one corner was carried along one side and end by a canal which, at the furthest corner, was connected with the delph out of which the material for the bank was thrown. By this arrangement the ulterior portions become first warped, so that the water should not have to be conducted over the higher ground to the lower. When the distant parts are sufficiently elevated, openings are cut in the side of the canal just mentioned, and by small cuts and guiding crests the whole surface receives an equal deposit. When the neap tides (which are not taken in), commence, the land is looked over, and channels or inlets made to the lowest places. From the methods here employed for insuring an uniform deposition of warp, perhaps much might be gathered respecting the laws of tidal action in forming sand-banks and deltas; great foresight and continual care are required in causing an even surface in a warping-field; might not the means there used be of advantage in more expanded areas while embanking from the ocean? When the operation is perfected, open drains or grips are dug at frequent intervals in the new soil, so that by the assistance of rains the salt may be washed out of it; and the warping-drain now becomes a main outlet for the drainage water, the self-acting sluice-doors at the outfall holding out the Trent tides, and emitting the land water at every ebb. I may here remark that an extraordinary difference in the quality and value of warp land arises from the degree of excellence of its drainage. This may depend in a great measure upon the height to which the land is raised, and the porous or impervious character of the stratum which it covers. This fact is another foot-hold for those who affirm that the tillers of the wide alluvial plains of Britain may vastly augment the productiveness of their soil, even of the most garden-like mould.

How many thousands of acres of alluvium in Lincolnshire, Somersetshire, Lancashire, North Britain, rich though they be, are being equalled, nay surpassed, in bushel produce by the lately waste hostile and flinty downs, mainly because subsoil drainage and aeration, so marvellously fecundatory on sloping lands, has not been well carried out in these low-lying and dead-level districts. The outfall is inefficient; but a good outfall is within reach. There are hardly any of the alluvial flats but might gain a fall of three or more feet by a better system of district drainage, by an improvement of the main arteries, inland and chief rivers to seaward. High-country farmers visiting the lowlands are invariably surprised and disappointed when they learn the actual yield of the crop; their reason calculating that the produce here will be as much greater than their own as the mellow loam they behold excels in apparent fertility the dry sand or brick clay they have left. Will not a completer drainage still further warm and fructify these moist lands? If speedy drying and stagnant soaking, though only to a small extent, make most important variations in the producing power of different spots of the same soil, may not these conditions cause the same inequalities in different districts of the like soil?

The first crop on the warp is Clover and other Grass

seeds; then Beans, then Wheat, yielding from 30 to 36 bushels per acre; then "line" or Flax, followed by Wheat, by which time the land being foul will need fallowing. Near to the Trent side Potatoes are grown; on the richest grounds alternating with Wheat. The cost price of the land now spoken of was from 2*l.* to 2*l.* 10*s.* per acre; and the expense of warping, including the digging of the main canal, building of the sluice, throwing up ramparts round the lands, conducting the process, &c., was about 18*l.* per acre. The owner and occupier, whose extensive artificially-improved estate I viewed, is of opinion that the warp lands are much overvalued; and that when Wheat is at 60*s.* per qr. the rental here ought to be 2*l.* per acre. Closer to the river, where Potatoes are planted because of ready shipment, and on the natural warps where Wheat and Potatoes (8 to 10 tons per acre), are the common rotation, the rent of course is very much higher.

How many fortunes have been realised by landlords? how many tenant farmers have reaped a comfortable livelihood? how many labourers have been nurtured and fed? how large a proportion of the community have shared the teeming products? how much disease has been cleansed faom the atmosphere? how many acres by the margin of the Severn, Thames, and other streams, may yet be benefited—by means of warping? With these interrogations I close a somewhat desultory paper. *I. A. C., Oct.* 21.

Home Correspondence.

Allotments.—With respect to allotments, I wish to state that I let, on the part of my father, about 18½ acres of land in allotments to labourers and others in the parish. The rent varies from 1*l.* to 3*l.* an acre free of tax. The allotments are anxiously sought after. Many, I believe, find it worth their while to hire assistance when pressed for time. Those who work for my father will ask leave occasionally, but very rarely, to be absent for the purpose of devoting a day or two's labour to their allotments. I believe the system works well. The difficulty is to make the men derive the profit they ought to derive from their land. The rents are paid with punctuality. One or two tenants hang fire, as it were, for a few weeks, but usually pay at last. In four years and a half I think I have only once had occasion to seize a crop for rent. On two occasions I have ejected tenants for misconduct. One I have since readmitted. My bailiff receives the rents, and superintends the allotments. I forbid the tenants to put more than half their plot of ground into Wheat or Potatoes. Their mode of culture, with some few exceptions, is slovenly and imperfect, but I think improvement has commenced. It is a great thing when men begin to do their duty by their land, not because they are drilled into it, but because they see it is their own interest so to do. The latter principle of action at least argues the exercise of reflection and foresight. It is something for the mind to be roused into wholesome action. It may then be led to better things than even thrifty industry and perseverance. I think the little sphere of action furnished by an allotment rouses and stimulates the poor man's mind, and I would even say tends to soften his heart. He, too, as he looks upon his little plots of Potatoes, Onions, Carrots, &c., in various stages of growth chequering his humble domain, he too has something he can call his own—something to work for, to watch over, to love—as well as the wealthy farmer, who, mounted on his sleek cob, surveys his 50 acres of ruddy Wheat, and listens to the lowing of his score of oxen in the neighbouring meadow. Too many of our poorer labourers may be said, as regards their inward being, to be in a state of sour stagnation. To them returning morning and night, and the revolving seasons, bring but little hope, but little change. If allotments can be let without loss to the owner of the soil, and this is the fact in my case—if they can be hired by the labourers without damage to those for whom they labour—and this I fully believe—then the considerations just recited must have their weight with the humane and thoughtful. These remarks may be too desultory and too deficient in precision for insertion in your columns, but you are welcome to make any use of them you may think fit. I inclose the rules, from which please to omit my name and parish. The arguments of political economists against allotments are, no doubt, of weight; but, I think, can be rebutted. Remedies are not to be discarded because some evil accompanies the good resulting from them. *E.* [The following are the rules:

1. Each allotment to be let for twelve months, at the expiration of which, possession shall be given up, if required, after three months' notice.
2. The rent to be paid half-yearly, to
on the first after Michaelmas-day, and
the first after Lady-day.
3. No occupier of the allotment to be allowed to exchange, or underlet his allotment, or any portion of it, or to use any other than spade husbandry.
4. No occupier to trespass upon, or injure in any manner, another's land or produce.
5. Each occupier must keep his part of the fence, and drain, and also of the road within the field, in proper order.
6. Any occupier who shall fail to conform strictly to the foregoing regulations, or who shall mismanage his land, or who shall be convicted of any offence against the laws of his country, or who shall be guilty of drunkenness, or other immoral or irregular conduct, shall be subject to have his land taken from him immediately, and to forfeit his crop.]

On Bones of Animals Dying under Mortification.—In the last number of the "Quarterly Review, p. 483," is the following passage, "a pailful of water, suitably impregnated with salts, is speedily sucked up by the root of a growing tree immersed in it. Food or poison may thus be artificially administered to plants, and timber is thus hardened in France, and even stained while living of divers brilliant hues." This sentence confirms me in an opinion I have adopted, that plants may be rendered poisonous from growing on diseased matter. And I bring forward the following case as an illustration of it. A neighbour had two horses die from mortification and three or four sheep, the whole of which he had burned in a large pile of ashes; after the decomposition of the flesh, he had the bones pounded with hammers and all mixed together again and drilled for Turnips. In the part of the field where this compost was used the plant was most luxuriant; at the time of consuming them, the farmer folded his best tegs there, with the view of forcing them forward; first one died, then another, and a third, in three consecutive days: after which the shepherd drove them all to water, where they drank most plentifully; this brought on a violent scouring, and in his opinion saved the whole flock. His sheep were perfectly healthy before; and again after they were removed from these noxious Turnips. He first suspected they were poisoned by some malicious person, as he fancied he observed something like arsenic on opening them: bnt afterwards he came to a decided opinion, from seeing bits of the bones hanging on to the roots of the plants, that the whole mischief arose from their growing on the food of animals dying in a state of mortification. Most of his neighbours ridiculed this conceit, but the writer of this is justly convinced the farmer's opinion is correct, and the passage quoted from the "Quarterly Review," he thinks strengthens his belief. Upon my mentioning these circumstances to a worthy friend, he told me, last year he had the misfortune to lose several cows, and as many as 15 sheep, with two or three horses, and that he had buried their carcases in a large mound of earth, and spread the decomposed mass over a field whereon he had a magnificent crop of Wheat; he was not a little startled at my telling him I should be more grieved than surprised if he, and all his neighbours died of cholera within a year! What is the view taken by the editor of the *Gazette*, or of any competent person who may read this suggestion, and will take the trouble to answer the question? *J. D.*

Peat Charcoal, as manufactured by the Irish Amelioration Society, is now selling in London at 70*s.* per ton, and in Dublin free on board vessels, at 35*s.* These prices, however, are not finally fixed, so that little reliance can be placed upon them. It formerly sold in this capital at 50*s.*, but the Society have advanced it to 70*s.*, and they contemplate a further advance to 1*s.* 6*d.* per bushel, or between 4*l.* and 5*l.* per ton! Which is neither more nor less than extravagance. When every other product of commerce is coming down in price, here we have an Irish thing advancing, and for no other reason than that the Society cannot supply its customers. We have placed ourselves in communication with the Irish Amelioration Society, and have told it this, and it dare not deny it. For what, may we ask, did the Society receive its Charter, bearing date the 26th of January, 1849? "For the purpose of employing the peasantry of Ireland," thousands of whom are now starving for the want of employment, a pest in every province of the kingdom. If the patentee could manufacture peat charcoal 50*s.* when bread was so much higher than at present and confer upon his unhappy country such a blessing, what ought the Society to do now? We do not wish however to expatiate on this head; a hint we hope is sufficient. "It's an ill wind that blows nobody good," and we hope the extravagant prices of the Society will blow the patentee plenty of applications for licences in the United Kingdom, by landlords possessing peat-bog, who have it in their power to correct the evil complained of. A licence has been taken out in Lancashire, peat is being cut in that province, and we hope in the course of a month to hear of success attending the enterprise of the licentiate. *B.* [We should like to understand the necessity of a license to make peat charcoal.]

Mr. Milne's Reports.—I am a constant reader of your Paper, and though I cannot agree to the opinions sometimes expressed by you, on the subject of the present depressed state of agriculture, I have great confidence in your love of fair play. In the agricultural department of your Paper, under date 19th Oct., 1850, I find a very favourable review of a pamphlet, lately published by Mr. Milne, Milnegraden, Berwickshire, and read to a meeting of the East Berwickshire Farmers' Club. As to the diligence and ability displayed in that pamphlet I have never heard but one opinion. But as to the inferences drawn from it by Mr. Milne and you, some have great doubts. The design of the author of that pamphlet is to show that high farming, if not a remedy, is at least a palliative for the present sufferings of the farmer. But you, sir, go further than this, and assert that Mr. Rigden has "furnished an instance of the way in which energy and resolution, when seconded by the ability which ample capital confers, are able to develop the resources of the land so as to balance the evil of adverse circumstances." As regards the case of Mr. Rigden this may be true, but all are not placed in such favourable circumstances. On this side the border we have farms equally well managed, equally highly farmed, equally productive, which will not yield a profit to the farmer; and the reason is perfectly obvious, because the rent and the price of manure are nearly double. But I do not wish to occupy your time in repeating what is so much better stated in the extract of the speeches at the meeting of the East Berwickshire Farmers' Club. That extract is from a respectable Edinburgh paper, and as you have published part of Mr. Milne's observations, I think you are in fairness bound to refer to the remarks made in reply by Mr. Wilson, of which Mr. Milne himself declared that they "were worth more than the document which called them forth." These statements seem to me to show that, as regards Scotland, high farming will not pay at present prices, unless half the rent is thrown off, a sacrifice involving ruin to great part of the landowners, and which must inevitably produce a social revolution, such as Britain has never yet seen. *A Canny Scot.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

The Council resumed their sittings, after the usual autumn recess, on Wednesday last, the 6th of November, when a monthly meeting was held at the house of the Society, in Hanover-square. The chair was occupied by Mr. Raymond Barker, V.P.; and there were also present, Lord Portman, Lord Southampton, Hon. H. W. Wilson, Colonel Austen, Mr. Barnet, Mr. Beasley, Mr. Burke, Colonel Challoner, Mr. Garrett, Mr. Fisher Hobbs, Mr. Kinder, Mr. Milward, Mr. Shaw (of London), Professor Simonds, Mr. Simpson, Mr. Thompson (of Moat Hall), Professor Way, and Mr. Jonas Webb. The names of 44 candidates for election at the next meeting were read.

Finances.—Colonel Challoner, chairman of the Finance Committee, presented the report on the accounts of the Society to the end of the previous month; from which it appeared, that on the 31st of October, the current cash-balance, in the hands of the Bankers, was 927*l.* Colonel Challoner having reported, on the part of the Committee, the closing of the country meeting account at Exeter, the Council passed a vote of their best thanks to Messrs. Sanders and Co., who had so kindly accepted the appointment of local bankers to the Society, during the period of its Exeter meeting, and who had with so much courtesy and exactness transacted the Society's financial business on that occasion.

Lectures.—The Council decided that it would be advisable this year to postpone the lectures usually delivered to the members, on the occasion of their December meeting, to a more advanced period of the session, when a greater number of the members could more conveniently attend their delivery. Professors Way and Simonds expressed their readiness to obey the call of the Council, whenever it was thought that their services would best tend to promote the objects of the Society, and the convenience of its members.

Pavilion Dinner.—The Hon. R. H. Clive, M.P., and Mr. Shaw, the stewards of the Pavilion dinner, at Exeter, having communicated to the Council, the inconvenience arising from persons being admitted into the Pavilion, at the time the arrangements for the dinner were in progress, it was resolved, on the motion of Lord Portman, "That, at future country meetings of the Society, steps be taken to prevent the admission of any party into the Pavilion, during the preparations for the dinner, without express permission from the stewards of that department."

Judges.—Lord Portman, Mr. Shaw, Col. Challoner, and Mr. Fisher Hobbs, having expressed to the Council their views on the desirableness of a still further improvement on the present mode of nominating, selecting, and appointing the judges for the country meetings of the Society, it was carried, on the motion of Mr. Thompson, that the whole question should be referred to a special committee, consisting of the following gentlemen, who should be requested to report their recommendations to the Council, viz.: Mr. Thompson, Mr. Shaw, Mr. Fisher Hobbs, Mr. Garrett, Col. Challoner, Mr. Jonas Webb, Lord Portman, Hon. Capt. Pelham, M.P., Mr. Hamond, Sir M. W. Ridley, Bart., Mr. Hudson, of Castleacre, and Mr. Jonas.

Cattle-Yard Shedding.—On the motion of Mr. Fisher Hobbs, seconded by the Hon. H. W. Wilson, it was resolved that previously to the conclusion of the contract for the cattle-yard of next year, Mr. Manning, the Society's contractor of works, be requested to furnish estimates of the additional expense that would be incurred by rendering the covering of the cattle-sheds impervious to rain.

Implement Exhibition of 1851.—Mr. W. W. Nicholson, of Newark, transmitted to the Council a copy of the letter he had received from the Executive Committee of the Royal Commission for the Exhibition of 1851, in which he was informed, "that the Agricultural Implement Department would be entrusted to the Agricultural Society of England." The Council instructed the Secretary of the Society to communicate with the Executive Committee on this subject, pointing out to them their misconception of the arrangements under this head, and calling their attention to that portion of the Report of the Council to the General Meeting of the Society in May last, in which the distinct arrangements of the Society with the Royal Commissioners were announced; namely—

"The Council have accepted the invitation of the Royal Commission for the Exhibition of the Works of Industry of all Nations in 1851, to hold a Show of Cattle in Hyde Park in that year; but finding that the Royal Commission have included in the arrangements for their own Exhibition a department for agricultural implements, the Council, with a view of not interfering with this department of the Royal Exhibition, have resolved to omit the implement portion of the Society's Show in 1851, and to confine their exertions entirely to their Show of Cattle, as invited by the

"Royal Commission, and to take every means to render that "Show interesting as an exhibition of Breeding Stock."

FABRICATED REPORTS.—The Secretary laid before the Council his correspondence with the editor of one of the morning papers, who had incautiously, and without authority, given insertion to the fabricated report of a pretended meeting of the Council, assumed to have been held on the 24th of October, which had been extensively copied into other papers throughout the country, and had thus been the means of misrepresenting the Council and its actual proceedings. The editor, in justification, stated that the report in question had been received from one of the class of persons known as "Penny-a-liners," who were in the habit of supplying miscellaneous information to the public papers.

VETERINARY SCIENCE.—On the motion of Lord PORTMAN, seconded by Mr. Thompson, it was resolved that Mr. Fisher Hobbs, Mr. Jonas Webb, Colonel Challoner, Lord Portman, and Mr. Shaw, of London, be appointed a Committee, "to confer with the Governors of the Royal Veterinary College, during the week of the ensuing December meeting, to consider the best arrangements for carrying out their mutual object to to promote the extended application of Veterinary science to cattle, sheep, and pigs."

SMITHFIELD CLUB SHOW.—Mr. BRANDRETH GIBBS reminded those members of Council who intended to be exhibitors at the ensuing Christmas show of the Smithfield Club, that the last day for making the required entries, would be Saturday the 16th of November.

COTTAGES.—The DUKE of BEDFORD presented to the Council, for the library of the Society, a copy of an enlarged publication of the plans for Agricultural Cottages, communicated by His Grace to the Earl of Chichester, and published in the Journal of the Society. The Council accepted this present with a vote of their best thanks.

The best thanks of the Council were ordered for the numerous presents and miscellaneous communications then laid before them, and reserved for further discussion at the weekly meeting on the 11th of December.

The Council then adjourned to their monthly meeting on Wednesday the 4th of December next.

Farmers' Clubs.

EAST OF BERWICKSHIRE, *Oct.* 14: *Mr. Milne's Report on English Farming.*—Mr CUNNINGHAM, previous to seeing Mr. Milne's printed report, had visited the farms of Myremill and Auchness, in Ayrshire. At Myremill he found all that was at Auchness, and a good deal more. Indeed, the only thing he saw at Auchness worthy of remark, was the large breadth of Potatoes. The Italian Grasses were there very luxuriant, but exceedingly foul. He was led to believe the district was favourable to green crops; but the Turnips which he saw were not superior to those in our own district. It was the preservation and application of the manure, and the feeding of the stock, which principally attracted his attention. In reference to these particulars we make the following extracts from Mr. Cunningham's report. "Having, in June last, seen the system of stall-feeding as carried out at Auchness and Myremill, and believing this to be the leading feature and foundation of the whole improved mode of culture, I have prepared some plans and probable estimates of the expense of obtaining the necessary accommodation, which I now beg to submit to the consideration of the meeting.

1. As regards the extent of accommodation, I believe that as a general rule for feeding off alone, there should be a stall for every 4 acres of the farm. This would require for a farm of 400 acres 100 stalls; and, supposing that the system adopted at Myremill and other places were followed out, of feeding off two casts in the year, this gives accommodation for feeding off 200 cattle per annum. In building a new set of farm offices for this system, the arrangement would be different from the present, and perhaps much improved; but we proceed upon the idea that there exists a certain amount of accommodation, and not more than is actually required for the manufacturing of the crop, and the housing of the stock and implements of husbandry usually required—and if farmers are to breed and rear cattle until ready to be fed off, they will require all the courts, sheds, &c., they at present possess, and the feeding houses must be a new appendage altogether. The plans produced are made out with this view, and to build and finish these in a substantial and satisfactory manner, will cost at the rate of 5*l.* for each animal, exclusive of cartage, which, in ordinary situations, will cost 1*l.* 10*s.* additional. These erections are supposed to consist of stone walls, foreign timbers, roofs, &c., and slated. The floor laid with square flooring tiles, upon a bed of concrete, and having suitable channels for conveying off the urine, &c. The roof lathed, and this as also the walls to be plastered. A close and uniform floor and smooth surfaces throughout the building is considered essential for the thorough ventilation, purity of the air, and health of the animals within; and when it is considered that the number of 60 or 70 are located under one roof, it appears prudent to take every precaution to insure the thorough ventilation of the building. As yet, I have not seen any of these places so thoroughly ventilated as could be wished, and great variety of opinion exists as to the best mode of accomplishing it. One leading feature, however, must be the admission of an abundant supply of pure air from without, and the abstraction of the vitiated air from within. I propose, in the plans shown, to admit the air by pipes and gratings in the feeding passages, with additional pipes in the walls, and to place a trough or box along the apex of the ceiling, pierced with small holes, and this to terminate in a chimney within the flue of the boiler, thereby rarifying the air, and assisting materially in keeping up the circulation required.

"2. The collection of the liquid manure in tanks is indispensable, and these I would recommend to be built of a circular form, instead of an oblong square, as at Myremill, and lined with brick, and coated with cement. This form gives the largest area at least expense of walls; and further, should the new mode of distributing the liquid manure be adopted by means of forcing pumps and pipes, it is indispensable that an apparatus be applied to stir up the more solid parts, so as to send forth, in an equal form, the entire contents through the pipes, and the circular form is the most suitable for effecting this by the aid of machinery. A supply of water is also required to give the animals, washing out troughs, and flushing the gutters, and to dilute the manure, all of which should be conducted by pipes into the troughs and tanks. The question of converting the whole manure of the farm into a liquid state, may not receive the sanction and approval of many agriculturists; of its efficiency, applied in this form, I cannot give an opinion; and as the mode has only recently been adopted in this country, it would be hazardous to pronounce upon its utility. I have made a calculation of the expense, and if other points are as satisfactory, I doubt not but it will one day be generally adopted. In order to bring the matter of expense to a test, we shall suppose a farm of 400 acres, and 100 acres of this in root crops, and supposing 70 acres of these consumed in the offices, and 25 tons per acre as a medium crop, gives ... 1750 tons.
50 acres of Italian Rye-grass, cut thrice, 20 tons per acre ... ... 1000 ,,
200 acres of corn, straw of do., 1½ ton per acre ... 300 ,,
And an addition of one-third at least of water equal to 1000 ,,
Say ... ... 4000 ,,

Now this may be all sent through pipes by means of the steam-engine working five hours in the week upon an average for 52 weeks—260 hours.

The engine power I estimate at 2*s.* per hour	£26
Four men employed, say 3*d.* per hour	13
Interest on pipes and tear and wear	30
Do. on tanks, say	6
	£75

Compare this with the filling, carting to the fields, turning, filling, and carting out again, and spreading of say 3000 tons—1000 tons may be assumed to be lost by evaporation—I think it would not be over-estimating if I put it down at 1*s.* per ton. This is exactly double—150*l.* There is another consideration, and not the least important. By getting the manure applied in this manner, it lessens the amount of labour in May and June, when the Turnip crops are being got in, and which is generally the season of greatest exertion to get finished in time. Any arrangement that can tend to equalise the labour of the farm would unquestionably be a decided advantage. Mr. Cunningham then entered at considerable length into the details of estimates and plans which he had made of the expenses and accommodation required for carrying out the new systems of feeding cattle, and collecting and distributing liquid manure. He estimated the expense of the whole apparatus for collecting and distributing the manure over a 400 acre farm at 1*l.* 10*s.* per acre; and the expense of building feeding byres on the new system, reduced to the standard of acres at 1*l.* 5*s.* per acre, or 300*l.* for 60 head of cattle. The expense of building feeding-boxes he estimated at nearly 10*l.* per animal, and the expense of altering and fitting up present sheds and stalls at 1*l.* 13*s.* per animal. Mr. Cunningham had also visited the farm of Mr. Littledale in Cheshire, whose cattle are constantly fed in the house, summer and winter. The principal features of his system were the size and airiness of the buildings, and his mode of feeding, which was nearly the same as at the Ayrshire farms.

Mr. NISBET, of Rumbleton, upon being called upon by the Chairman, said he had tried the liquid manure system, not by means of pipes, but by casks mounted on carts, and had found himself amply repaid. He generally did his hay crop with about 4 tons per acre, and as soon as cut, he went over it again for a second crop, which was of immense advantage. He had also tried it on lea after two years Grass, with a like favourable result. His tank for collecting the manure contained 45 tons, and was 20 feet by 10 and by 8, the cost of it having been 25*l.* In reply to a question from the Chairman, Mr. Nisbet said he had tried Garrett's horse-hoe, for two years, and had by its use effected a considerable saving in seed, had an early harvest, saved a little land, and had immense advantage in having his land kept clean. Last year, out of 60 acres he had left 10 acres unhoed, and the quickens taken off these 10 acres were six times the quantity taken off the 50 which had been hoed. The cost of the hoe was 19*l.* By using two sets of horses, Mr. Nisbet could hoe 20 acres a-day, at a cost of 10*d.* an acre. His drills were 10 inches, and he drilled along the furrow. He found no difficulty in using the machine, but the fore-steerage could not be dispensed with. The person guiding it had only to direct this, and it kept it all right.—Mr. WILSON, of Edington Mains, was then called on by the Chairman, and spoke as follows:

Mr. Chairman and Gentlemen,—The report which we are now met to discuss bears upon the face of it, that it was upon my motion, seconded by our esteemed president (whose absence to-day is, on every account, so deeply to be regretted), that it was printed and circulated among us for our mature consideration. On that occasion, I expressed it as my opinion that we were much indebted to Mr. Milne for the great pains he had been at in preparing such a statement for our use; and now that I have considered it with care, I am glad to say it is still my opinion, that it is fitted, in several respects, to be useful to us, though there are many of its conclusions from which I entirely dissent. I see a good many mistakes, which, if they had been committed by a practical farmer, would have deserved to be pointedly animadverted upon; but knowing as I do that Mr. Milne is not, and does not profess to be, a practical farmer, it would be unreasonable and unfair not to make ample allowance for the disadvantage under which his observations and inquiries have been conducted. The report bears to be a description of three cases of successful farming in the south of England. Now, as it is stated upon the authority of the persons referred to, that they obtain a fair return from the business as severally conducted by them, I do not mean in the least to call in question the matter of fact, but simply to ascertain, if I can, to what it is that their success is mainly owing. Let us then consider a little the first instance of successful farming submitted to our notice. Now it is evident that this is most strictly a suburban farm, and that its management must of necessity differ essentially from that of land in rural districts. If it is to be compared with Scottish husbandry at all, it must be with farms similarly situated. Now, it so happens that I have by me a detailed statement of the whole expenditure on the one side, and of the whole produce upon the other, upon a farm of 400 imperial acres, situated five miles from Edinburgh. I refer to the farm of Woolmet, and quote from a statement published in "Blackwood's Magazine," for January last. I have here nothing to do with the purpose for which the statement was then published, but simply avail myself of it now, as affording me an opportunity of comparing an example of farming in the vicinity of Edinburgh with that described to us by Mr. Milne in the vicinity of Brighton. A glance at these two statements, while showing that the system of management pursued is in fact substantially the same, affords at the same time some most startling discrepancies. The Lothian farmer pays for his land 72*s.*, while the Sussex tenant has his, apparently of as good a quality, for 35*s.*; the price of manure in Edinburgh seems to be just about double what it is in Brighton—Mr. Gibson's gross outlay for foreign manure being 610*l.* for his 400 acres, against Mr. Rigden's 686*l.* for 740 acres; the prices paid for labour by the former are higher than by the latter; the distance which manure and produce have to be carted is five miles in the one case, and but one in the other. They both have the advantage of a lease, but Mr. Rigden's is greatly more favourable for the tenant, allowing him more discretion in the cropping of his farm than is almost ever the case in Scotland, although it seems amply sufficient to secure the landlord against deterioration of the land; and then by the usage of the district, Mr. Rigden has, under the name of "Mendments," security for the realising of a considerable portion of his capital at the termination of his lease, which is unknown with us. It appears further that Mr. Gibson employs fewer horses in proportion to his carriage and mileage than Mr. Rigden; that his general expenses are less than Mr. Rigden's by nearly 20*s.* per acre; that the capital with which he carries on his business is also smaller by no less than 7*l.* 10*s.* per acre; and yet that his gross produce is greater by 1*l.* per acre. Let it be observed further, that the comparison now instituted is betwixt farms situated respectively five miles and one mile from a city. If I had taken farms within one mile of Edinburgh, where the average rent is 5*l.* 12*s.* per imperial acre, it is evident that this single item of additional rent paid by the Scotch farmer (amounting, on 740 acres, to some 2800*l.*), greatly more than absorbs the whole surplus in Mr. Rigden's statements; and that, upon the whole, if it be deemed proper that we should take a lesson from suburban farmers, it would be greatly more advantageous to pay a visit to Woolmet than to Hove. The next case cited is that of the Rev. Mr. Huxtable, Sutton Waldron, Dorsetshire. Now, whatever may be thought of the propriety of a minister of the gospel entangling himself with secular business to the extent which Mr. Huxtable has done, I cannot but admire the motive which seems mainly to have influenced him in the outset of his agricultural career, viz., to furnish employment to the farm-labourers of his own parish. Though this case is a very different one from that just mentioned, it is evident that here also the business of farming is carried on under advantages not possessed by us. For, though situated in a rural district, we see that those things which constitute what may be called the raw material of our business, viz., land and labour, are there obtained at a rate very different from those paid by ourselves. It appears that Mr. Huxtable's land costs him from 15*s.* to 18*s.* per acre, and that the ordinary wages of able-bodied labourers, in Dorsetshire, range from 6*s.* 6*d.* to 8*s.* per week. Now, though we are told that this land is of a very inferior description, it appears that, under Mr. Huxtable's management, it yields crops not, in the main, inferior to the two others; for in comparing the statements given in the report of the average produce of the three farms, it appears that Mr. Huxtable's average of Wheat exceeds Mr. Morton's, and equals Mr. Rigden's; that his Barley exceeds Mr. Rigden's by 10 bushels per acre; and that his root crops are not greatly inferior to either of the others. Now, I would just like to ask, where in all Scotland can you get land at 15*s.* per acre, capable, *under any management*, of yielding from 30 to 36 bushels of Wheat, or 25 tons of Mangolds per acre? Indeed, in reading the report, I have been very greatly struck with the difference of the rent in England and amongst ourselves, and still more with the excessive disproportion betwixt the rent of land and the value of its produce over the arable lands of Scotland. I must also beg leave to express my deliberate conviction, that until this disproportion is fairly adjusted, it is vain to talk of further outlay and improvements, or to expect that things can long continue as they are. In regard to the farm of Whitfield, which is the third one alluded to in the report, the statement is so meagre that we have not materials for comparing it properly either with the two former, or with the modes practised by ourselves. It appears that Mr. Morton conducts his business in a more economical manner than the two others, particularly as regards the number of men and horses with which he works his farm. His produce of Wheat per acre is less than that of either of the others, viz., 30 bushels, and his root crops being given in the lump, cannot be exactly compared with theirs. His rent, however, is much greater, being (public burdens included), 50*s.* per acre. Indeed, it appears, that when a Scotchman strays into England, his capabilities of paying rent are reckoned upon, and he is amerced accordingly. In comparing our own practice with that described to us in this report, one of the prominent things wherein it would appear that we are greatly deficient is the almost universal absence amongst us of any provision for preserving and applying the liquid manure of our homesteads, &c. Whatever may be done by individuals, I am quite aware of the fact, that generally over this district, this valuable portion of the manure produced upon our farms, is almost entirely lost. While I make this admission, let it be understood that this waste does not arise either from disbelief in the value of the article itself, or from ignorance of the expedients which have been tried or suggested for its application, but simply from the persuasion that they are either too cumbrous or costly to be safely adopted. And so, notwithstanding all that I have seen or heard upon this subject, I am still of opinion that that important problem of the profitable application of liquid manure has yet to be solved. It is urged by the advocates of box-feeding, that the end is secured by this system, as the whole urine is said to be absorbed by the litter. Others have recently spoken strongly of the advantages of using peat charcoal for the same purpose, and then carting it upon the land. We have heard also, to-day, a most interesting account of the plan adopted at Myremill for accomplishing the same end, by means of pipes and a powerful force-pump, worked by a steam-engine. This process I have had an opportunity of witnessing myself in August last, and, like Mr. Cunningham and his friends, I was certainly most intensely interested and gratified by what I saw at Myremill. Mr. Nisbet, too, has told us, that for several years he has applied this manure in the way he has described, and, as he believes, with a profit. Be it observed, however, that while he states expressly that his Oats and Grass appeared to be better when thus manured, that he has not had recourse to weighing or measuring, so as to be able to set the cost and the profit against each other. I can understand, too, how, on such a scale as Mr. Nisbet describes, when all that is attempted is just to save the liquid manure not absorbed by the litter, it may be possible to get such an amount of liquid applied to the land near a homestead, by taking advantage of chance times of the odd horse and boy usually employed for carting Turnips and similar work; and so, without seriously interfering with the regular labour of the farm. So that, while I do not presume to say that any or all of these plans will not succeed, I just repeat that they have not yet been so accurately and fully tested, as to warrant any prudent farmer in asking his landlord to enable him to try them on a large scale. Even Mr. Kennedy (of Myremill), who has gone into his peculiar plan on such an extensive scale, spoke of it with a modesty and caution which I greatly admired. He, of course, thinks that he will succeed; but does not pretend that this is yet conclusively established. The management of the live stock upon these farms has appeared to Mr. Milne superior to ours in several respects, which he has particularised. In part, I admit this to be true. The system of fattening cattle in boxes, rather than in open yards is, I believe, worthy of trial, and has, indeed, been already tried to some extent among ourselves. My own experiments have hitherto been on a small scale, but still I was so satisfied with the result as to have asked and obtained from my landlord the means of trying it more fully. Last winter I had two bullocks put up in this way, and certainly the progress was decidedly more rapid than that of their fellows kept in the open yard. I am also now convinced that Mr. Huxtable's statement of the small quantity of Turnips on which he can fatten a bullock is strictly correct. Had I met with it a year ago, I must say that it would have appeared to me incredible, and I do not wonder that others so regard it still. I shall, however tell you my reasons for believing that his plan of inducing his cattle to eat a large daily allowance of chopped straw promotes their growth, and yet makes fewer Turnips suffice. Last spring

being apprehensive that my Turnips were to be done before my cattle were fit for the market, I was induced to purchase a straw cutter, and after trying my cattle with a daily mess of chopped straw, moistened with cold water, in which a little Linseed-meal was steeped, I was gratified by finding that half the quantity of Turnips which they formerly consumed quite satisfied their appetite, and that their improvement was rather more rapid than before. After seeing this, I was able by reflecting on past observation, to account for this in a way quite satisfactory to myself. I have observed, for example, that when beasts, especially if they are in rather poor condition, are put upon full Turnips, they will consume a greater quantity without any proportionate increase; and that even for months, their bowels will be so relaxed as to amount to something like constant diarrhœa,—the explanation of which seems to be that when they eat a larger quantity of food, such as Turnips, than their system can assimilate, that the surplus does positive harm, and is worse than wasted. On the other hand, I have several times noticed that when I have reserved a heifer or two for breeding, and kept them in the straw yard with only a single daily feed of Turnips, that they have for a considerable time made greater progress than those that were on full Turnips. Indeed, Sir, I look upon this as the most important point brought before us in this report, and that we shall all find it for our advantage to copy Mr. Huxtable's practice in this particular. The sheep husbandry here described, I cannot regard as better than our own. It seems to me that Mr. Rigden keeps his flock at greater expense and trouble than we do, and yet if you set aside what arises from his ram-breeding, his results are inferior to those obtained by many persons around me. His wedder lambs are sold in August at 20*s.* each, and the wool of his ewes averages 4*s.* a head, while from a flock of 350 ewes he only weans 400 lambs, which we all should consider a very poor crop indeed. In regard to fattening sheep, I can quite believe that their absolute increase is greater when fed in covered pens than in the open field, but then it is done at a greatly increased expense In fact, the enormous cartage implied in first bringing the whole Turnips on our farms to the homestead, and then re-carrying the manure a-field, would dislocate our whole existing arrangements, and involve a complete revolution in our management. The expense of all this, as compared with our present plan of sending our shepherd with his flock, nets, and stakes, into a field of Turnips, and consuming such a portion as we deem suitable on the ground where they grow, must be very great indeed. By the plan of folding, too, the manure is as equally distributed as by any other, and on light soils the treading of the sheep consolidates the land better and cheaper than any roller yet invented. A good deal is said in the report about the manner in which we keep our farm horses, which is alleged to be more expensive than in various instances quoted both in England and Scotland. Now, I am satisfied that there is a double fallacy here. In the first place, it is assumed that, after deducting the wages of the ploughman from 100*l.* (the sum stated as the annual expense consequent upon the keeping of each pair of horses), the whole balance is expended in their food. Now, I have always understood that, when this estimate is referred to, it is meant to cover not these two items merely, but also the interest upon the price of the horses, harness, and implements, their annual tear and wear, and the risk of loss. When these are taken into account, and allowance made for the altered price of corn and hay, I believe it will be found that our horses are kept very economically. I admit, however, that it is decidedly better to keep our horses on cut Clover, or similar food in summer, than to pasture them, as is very usually done. And then, in the second place, even though it be true that our horses consume more corn than is given in other districts, we get through our work with fewer of them. There is one part of Mr. Rigden's practice which I consider worthy of our imitation. It is stated that he applies the greater part of the manure in autumn to his crops which are to be sown in spring. I have recently been trying this myself, and know that others have done the same, and think that it may be extended with advantage. In connection with this, I wish to notice an error into which Mr. Milne has fallen, in contrasting the quantity of manure applied on these farms, which he describes, with the allowance usually given here. After stating that the manure is applied directly for every crop, and in quantities amounting in the aggregate to 12 tons per acre per annum on the whole farm, it is estimated that our gross allowance is only from 4 to 5 tons, and that we usually manure for the Turnip crop only. Now Mr. Milne has overlooked the fact, that, while we cart our manure only for the Turnip crop, yet as a large portion of that crop is usually consumed on the ground, and as our Grass is depastured, we in reality manure directly for at least three crops in each rotation. Besides, I believe that the quantity applied to the Turnip crop is on our best managed farms greater than is stated. As select farms are used for comparison on the one side, it is but fair that the same thing be done on the other. I had almost omitted to notice that part of the report where a strong statement is made in connection with the total removal of subdivision fences on these English farms. Now, when the smallness of the fields in some parts of England is considered, and the enormous mounds, with all their accompaniments of large timber, brushwood, and weeds, by which they are surrounded, I can quite understand that a wholesale removal of these is a most necessary preliminary to profitable culture; but when fields range from 20 to 50 acres, and the fences consist of a simple line of Thorns, I am not prepared to recommend their removal. While our present system of husbandry is continued, I believe them to be positively beneficial to our live stock, and not injurious to crops, unless where hedegrow trees are present. And now I think I have gone over what appeared most important in this report of Mr. Milne's. I had intended to allude to some other points, but I feel that I have already occupied too much of the time of the meeting, and I am almost ashamed at the undue length of my observations, when I see around me so many of my neighbours, to whom I frankly and cheerfully confess myself inferior both in judgment and experience. (Mr. Wilson then sat down amid great applause.)

Mr. Milne said: The admirable statements made by Mr. Wilson were worth far more than the document which had called them forth.

If his report had done nothing more than elicit these remarks, he thought he had done the Club good service in having been the means of putting them in the possession of so much valuable information. The first part of Mr. Wilson's address had reference to a comparison of the farming of England with the farming of Scotland. It never was his (Mr. Milne's) object to say that the farming of England was superior to that of Scotland in its general results. On the contrary, it would be found that he bore testimony to the superiority of Scotch husbandry, and had suggested some reasons for the higher rents and greater produce obtained by Scotch farmers. While fully concurring with Mr. Wilson that the results of the farm management he had reported on were, in these respects, not greater than had been produced by many Scotch farms, he was yet certain that there were practices pursued on them different from those in common use in Scotland; he had merely described these practices, and he left it for the Berwickshire farmers to determine whether or not they were superior. Mr. Milne then alluded to such parts of these practices as had received the approval of Mr. Wilson in his comments on the report, viz., the mixture of food (by chopping straw to mix with Turnips), autumn manuring, the house-feeding of horses in summer as well as winter, and the box-feeding of cattle. He also referred to those points on which Mr. Wilson had expressed a doubtful or unfavourable opinion. Mr. Wilson's objection to the feeding of sheep in the homestead all the year round, on account of the expense of carting food to them, and manure from them to the fields, applied with equal force to the feeding at the homestead of horses and cattle, in regard to which Mr. Wilson had expressed a favourable opinion. With regard to the removal of the fences from Berwickshire farms, it was a mistake to suppose he had recommended it. With reference to the feeding of cattle, he might mention, that an experienced and intelligent farmer in this district, a member of the Club, had told him a few days ago, that he had fed six oxen in his sheds last summer on cut Clover, and other six of the same age and breed on pasture; and that he was satisfied, notwithstanding the greater expense of the first mentioned plan, that it was much more profitable. It was proper also that it should be known, with reference to Mr. Nisbet's testimony, on the subject of liquid manuring, that he had commenced the practice at first on a small scale; and that having become convinced of its expediency, he had, at his own expense without any assistance from his landlord, erected a stone and lime reservoir, arched over with bricks, and procured all the apparatus connected with it. This showed the strength of his conviction. In conclusion, he was glad to find that the general opinion was, that his pamphlet contained suggestions not altogether without value, and it would give him still further pleasure to find that these suggestions were improved upon and adopted. Having expressed a wish that the chairman would embody his idea of the discussion in a practical resolution, and having again returned thanks for the favourable hearing which he had obtained, Mr. Milne sat down amid great applause.

The following were adopted as the resolutions of the meeting:—"After hearing the above discussion, the meeting are of opinion, that there are several parts of the systems mentioned in Mr. Milne's report which appear to be deserving of a careful but cautious trial, or to be more extensively carried out than they have hitherto been in this district, but that it would not be expedient, or generally practicable, to follow the whole system of high farming therein reported, particularly as it has been shown that equal results have been brought out by the application of much less capital than is stated to be employed in the cases reported. One of the most important of the points contained in the report is the feeding of cattle. The meeting would approve of the more general adoption of feeding in boxes, the trials that have already been made in this district having proved successful, and also because the practice can be adopted with facility and at moderate expense by converting the present buildings into proper accommodation for that purpose. This system has been gradually coming into operation for some years, by the diminishing of the size of the yards, and increasing the size, warmth, and comfort of the sheds, and covering the feeding troughs in the yards. This plan appears to the meeting to be more worthy of adoption, as the cheapest and best means of preserving the manure, both liquid and solid. In the feeding of cattle it seems desirable to induce them to eat a larger quantity of straw than their inclination would lead them to, when it is newly given to them in racks in the usual way; and this can be effectually done by chopping the straw and moistening it with a mucilage prepared by steeping Linseed-meal in cold water, and not to give the full quantity of Turnips the animals would be inclined to eat; by this means they feed more readily, and of course a greater number may be kept. The soiling of cattle in the house in summer, to a certain extent, may also be desirable. It is the opinion of the meeting that nothing has been shown to warrant any essential departure from the present mode of the management of sheep followed in this district. In the feeding of horses, it appears to the meeting that soiling in the house or yards in summer, is preferable to grazing in the field. In reference to the statement in Mr. Milne's report, that horses are kept at a greater expense here than elsewhere, it is the opinion of the meeting that this is not the case, particularly when it is considered that in this district the work of the farm is performed with fewer horses in proportion to the acreage than those instances with which it has been contrasted. The sum of 100*l.* referred to by Mr. Milne as the common estimate of the expense of keeping a pair of horses in Berwickshire, includes not only the wages of the ploughmen and food for the horses, but also the interest of the money expended in the purchase of them, the harness and other implements, which they are to work, the annual cost of keeping them in repairs, and the deterioration in value of the horses, from increase of age, &c. When these items are taken into account, and allowance made for the diminished price of provender, the estimate will be found to be as moderate as any of these cases described by Mr. Milne. A favourable opinion is entertained by the meeting of Mr. Rigden's practice of autumn manuring to a certain extent. The meeting cannot approve of the substitution of wattles for fences of the large and open fields of this district; but in an agricultural point of view, would recommend the diminution of hedgerow trees. The meeting again acknowledge the obligation the Club owes to Mr. Milne for the trouble he has taken in drawing up his report, and for the zeal he has shown in bringing before it the most recent systems for discussion." Dr. Hood, of Whitecross, then proposed a vote of thanks to the Chairman for his conduct in the chair, which was carried with much applause, and the meeting separated.

Newcastle, *Oct.* 5: *The Steam Engine in its Application to Agriculture.*—Mr. Laws alluded to the application of steam-power to the drainage of the soil (whereby, in the more southern counties of the island, thousands of acres have been reclaimed), and to the purposes of irrigation. He then treated of ploughing by steam, and came to the conclusion that team labour was not in any danger of being set aside by the steam-engine. He thought, however, that with light engines and carriages, cheap branch lines, running through our agricultural districts, carrying coal, lime, and manure to the farmer, and transporting corn, green crops, milk, &c., to the towns, would prove remunerative. We give the latter part of the paper in full:—

"Threshing is the principal farming purpose to which steam power is applied in this neighbourhood; and it fortunately happens that its application to barn-work is very simple, and easily accomplished. The steam-engine for such purposes differs but little or none from the usual construction; although certainly what is called the overhead crank engine is the one most generally employed, as it costs less, is simpler in its parts and fittings, and is easier managed than the beam engine, all of which advantages are of consequence to the farmer. The non-condensing is generally preferred to the condensing engine, on account of requiring less water, and for the reasons I have already given in favour of the crank engine. The non-condensing certainly consumes a little more fuel than the condensing engine; yet, upon the whole, it is the most suitable for farm purposes; and if well made and managed, a four-horse power engine will not consume more than 1 cwt. of common coals in the hour; and, during that time [Qu. day,] it will thresh from 25 to 30 bolls of Wheat, according to the yield, and Oats and Barley in proportion. I am of opinion that where steam power has been applied in this district, in the majority of cases the steam-engine and machinery has been erected upon too extensive a scale; for, in its present form and proportions, it is only upon the largest farms that it can be beneficially employed. Here I think our millwrights are wrong; because a well made horse-machine is quite competent to thresh the crop, even upon a moderately large farm; and to erect an engine of six or seven horse-power upon any farm not employing more than three draughts, and not fattening cattle, is preposterous in the extreme. In such a case, even setting aside the expense, the boiler requires as much fuel to raise the steam as to thresh the crop, besides demanding more hands to attend the machinery than can generally be spared upon such a farm. Indeed, the advantage of steam power is very questionable upon any farm not working more than three pairs of horses, unless fattening stock are kept upon it. In such a case a steam-engine is a most valuable acquisition, as it not only threshes the crop, but affords the means of crushing and grinding inferior grain, pulse, &c., and, if required, cutting hay and straw for fodder. The spare steam may also, when needed, be used for cooking or preparing the food for horses and cattle. I am quite aware many of you will consider the latter operations as not of much consequence, but I must also recollect that there are many agriculturists who do attach much value to them, and my object is merely to point out the most suitable means of performing such operations, leaving the adoption of them to such as have the means and will to carry them out. But to proceed—I will pass over a large farm, because, if situated in this cold district, no doubt exists of the superiority of steam in preference to horse-power for threshing; and take the case of one working three pairs of horses, and feeding off in the house a dozen cattle or so, besides dairy stock and pigs. We will also take it for granted that a considerable quantity of inferior and refuse grain, Peas, &c., is used for the fattening of cattle and pigs, besides cut hay and straw for the remainder of the stock. Upon such a farm the engine need not be more than three-horse power. Indeed, if well managed it may be less, and yet perfectly sufficient for the purposes to which we wish to apply it. The threshing machine ought to be simple, and as lightly constructed as is consistent with durability. One rake is sufficient, and is less liable to entangle the straw than when two are used. It ought also to be furnished with elevators for carrying away the threshed corn into a chamber apart from the barn, and immediately above the dressing machine, which ought also to be driven by the engine, along with or separate from the threshing mill, at the pleasure of the manager. The threshing mill is generally driven by gearing, and the subordinate machines by means of straps running on fast and loose pulleys, so as to be set in motion or stopped while the engine is at work. The engine will have a 6-inch cylinder and 18-inch stroke, making about 70 strokes per minute. The boiler will be about 2 feet 9 inches diameter, and 12 feet long; or if used for steaming food for cattle, it may be preferable to use two boilers, each about 9 or 10 feet long, and 2 feet in diameter. They ought to be constructed so as to be used independently of each other; and although they will cost a little more than a single large one, will, in the end, effect a considerable saving in fuel, by obviating the necessity of using the large boiler when wanted for steaming, or when little work is to be done. The engine ought to have what is technically called lap and lead of the slide, so as to use the steam expansively and effect a still further economy in fuel, and the full working pressure ought never to exceed 45 lbs. per square inch. Such a machine will thresh from 16 to 24 bushels in the hour, according to the yield, and will thoroughly separate the corn from the straw, and carry the threshed corn into the clean chamber, there to lie until the threshing is finished. The dressing may then commence, which is better than carrying them on simultaneously, as a better sample can be thus obtained, owing to the greater regularity of the feed and blast. The cost of such a machine and engine, including dressing machine and elevators, ought not to exceed 120*l.* at the outside; the interest upon which, together with the wear and tear, may be taken as amounting to 7*l.* 10*s.* The hands required will be as follows: A man to attend the engine and machinery, another to feed the machine, two girls to hand up the sheaves, and two women to take away the straw; in all, six hands. The expense will be as under: Beginning at 6 o'clock in the morning, allowing half an hour at 8 o'clock for breakfast, and a quarter at 10, finishing at noon; in all five hours and a quarter. The expense will be as under, setting aside interest upon the prime cost:

	s.	*d.*
Man attending engine and machine, at 2*s.* per day ...	1	0
Man feeding machine	1	0
Two girls handing the sheaves, &c., at 6*d.*	0	6
Two women taking away the straw, at 10*d.*	0	10
Fuel for the engine (cwt. per hour), including raising the steam, 7 cwt., and carriage, at 3*s.* 6*d.* per ton	1	3
Oil, tallow, &c., for engine and machinery	0	3
	4	10

The quantity threshed in the above time would be about 90 bushels, costing in round numbers rather more than a half-penny per bushel. The dressing of the corn fit for market, requiring a man and a boy to attend the machinery, take away the sacks, &c. (time required about two hours or two hours and a half, according to circumstances), would stand as under. The engine might be grinding or crushing grain at the same time and with the same hands.

	s.	*d.*
Wages of man attending machinery	0	6
Wages of boy assisting ditto	0	1½
Fuel required for the engine, oil, &c., about	0	3½
	0	11

Or less than a farthing per bushel. Stated cost of threshing and dressing 90 bushels of Wheat, 5*s.* 9*d.*; or under 1*d.* per bushel. Now let us see what the above would cost by horse-power. To thresh the above quantity would require four good horses and driver, besides an extra hand to clear away the threshed corn. The cost of the machinery would be about 60*l.*; the interest upon which, together with the wear and tear, would amount to about 4*l.* 10*s.* in the year. The cost of threshing 100 bushels of Wheat would be as under:

	s.	*d.*
Man to feed in the threshing mill, at 2*s.* per day ...	1	0
Boy to drive, at 8*d.* per day	0	4
Two girls to hand up the sheaves, at 6*d.* per day ...	0	6
Two women to take away the straw, at 10*d.* per day	0	10
Four horses, at 1*s.* 3*d.* each	5	0
Oil, &c.	0	1½
Per 100 bushels	7	9½

To dress this corn as it is generally done, putting it once slowly through the machine, as in the former case, will require as follows:

	s.	*d.*
Man to measure up the corn	0	6
Two women to turn the machine...	0	2½
Woman to hold the sacks	0	2½
Girl to feed in	0	1½
Total cost of threshing and dressing 100 bushels ...	8	10

Showing a balance in favour of steam power of 3*s.* 1*d.*, or in other words effecting a saving of 35 per cent. But, as I have already said, it is not from the threshing that the full benefit of steam power is to be derived; inasmuch as, when applied to crushing and grinding grain for home use, it is found immeasurably superior to horse-power, affording, as it does, the means of using up the whole of the farmer's inferior corn. In fact, since such corn can now scarcely meet with a buyer in the market, the farmer is almost necessitated to use it at home, and afterwards sell it in the form of beef or pork. It may not be amiss to mention that common millstones answer best for the above purpose, when all things are taken into consideration. The same saving in favour of steam *versus* horse power applies equally to the chaff cutter. Whether cutting hay or straw is of real service, would be presumptuous in me to say—as even amongst the gentlemen here assembled scarcely two opinions will be found alike; all that I can do is simply to point out the best and cheapest method of performing such an operation—and I again say the steam-engine will effect it much cheaper than either horse-power or human labour. Amongst

the miscellaneous purposes to which steam can be applied, I have already mentioned the conveyance of liquid manure and the prepsring of food for cattle. In addition to those there are many subordinate machines to which it may form the motive power, such as pumps for supplying the homestead with water, churns, and such like; and, however trivial these may appear to people who have not seen and do not heed them, still they are useful in their proper station, and I am accordingly bound to give them a place in the present paper. I must not omit to state that the spare steam from the engine can be most economically used for heating purposes, and for drying corn.—Mr. William Stephenson gave the Club the benefit of his experience. It was 18 years, he said, since he first put up his steam engine, which is of eight horse-power; and all its power was required to thresh his corn. He put up a steam-engine because his horses were so fatigued after threshing that they could do no more work that day. He found no difficulty in the working of the engine; for any farm-servant of ordinary intelligence could learn how to manage it in a week. The cost of keeping it in order had not exceeded 20*s.* a year during all the time that it had been in use. The original cost was 150*l.* The saving effected he estimated at 50 per cent. He was, he believed, from 80*l.* to 100*l.* annually into pocket by his engine. The difference between a horse threshing-machine and steam, he estimated at one-half in favour of the latter. He used it also for various other purposes, such as crushing corn, &c. But no farmer, not having more than three pair of horses, would be justified in putting up an engine, but if a tenant had 200 acres in tillage it would answer his purpose to have an engine; although, certainly, these were not tempting times, the prospects of agriculture being gloomy; but it was to be hoped that they would improve. His friend Mr. Burnett, who had used an engine for 20 years, applying it to all purposes, could speak to the value of steam power.—Mr. Nicholas Burnett said he found great benefit from the use of his engine. He applied it to various purposes. When going it was employed to turn the winnowing machine. It did everything, in fact, that it could be made to do. It did not plough, certainly; but notwithstanding what his young friend had said, he hoped the time was coming when the land would partly be ploughed by steam. He remembered, 14 years ago, going to see a steam-engine plough Lucker Moss. It did not answer, certainly; and the engine was there yet, sticking in the bog, and, while all the world was on the move, it was making no progress; being bound to the soil, he supposed, by some sort of mortgage. It was, however, an unfortunate locality for such an experiment, the land being mid-leg deep in moss.

Miscellaneous.

The Birmingham Cattle Show.—The second annual exhibition of fat cattle, sheep, pigs, and poultry, will be held at Birmingham on the 10th, 11th, 12th, and 13th of December next. It is announced by advertisement in another column that the entries for the several classes close on the 16th of November, and intending exhibitors are invited to make immediate application for the necessary certificates, stating, at the same time, the nature and number of the stock for which they are required. The show will, this year, be held in the Bingley Exhibition Hall—a large and handsome building, now nearly completed, in Broad-street, and which will also be available for other exhibitions. The building covers upwards of an acre of land, and will afford very complete accommodation for the stock. In this respect, indeed, the promoters of the Birmingham Show will probably now possess unequalled advantages. His Royal Highness the Prince Albert is the patron, and a most liberal supporter of the Exhibition, having last year forwarded a donation of 50*l.*, and entered stock for competition in several classes. Lord Hatherton is the president, the mayor of Birmingham being vice-president; and the co-operation of the principal landowners in the Midland Counties has been obtained. We are informed that the show of stock this year will exceed that of 1849, both in number and quality. The poultry show is also attracting very great attention, and will, it is expected, be the largest and most interesting ever held in England.

Farming without Ploughing or Fallowing.—Within the last few days I made a small tour through a portion of Essex, and on my way passed the Colnes. The Wheats were looking pretty well, and I doubt not will produce an average crop, although the late weather has considerably laid some of the heavier sorts. I was, however, Sir, much pleased with a piece of experimental farming that has now been carried on for seven years by Mr. J. D. Piper, of Colne Engaine. This gentleman long since had a conviction that Wheat would flourish best in solid soils, and that on ground which was comparatively undisturbed, this crop might be grown for many successive years without fallowing. He determined to try the experiment, and has now grown on the same piece of land six *successive* crops of *Wheat* without on any occasion allowing a plough to turn over a single sod. The soil, in fact, has not been disturbed by plough, spade, or any other implement; the only thing used has been a hoe, and this has not been employed to loosen the soil, but merely to remove the surface weeds. The course has been to reap the Wheat with a short stubble, and to let them remain in the ground; to hoe off the surface weeds and burn them; and then to dibble in seed between the old stubbles to the extent of a peck and a half per acre, the rows being one foot apart. The average product of the last five years' Wheat crops under this system of farming has been *ten coombs and two bushels per acre.* At the present moment there is standing upon this same piece of undisturbed land, the sixth successive crop of Wheat, and truly it is a noble piece of corn, the straw being remarkably good, and the ears very large, full, and heavy—the crop will be at least 11 coombs per acre. [There was only 10 coombs and one bushel this year. J. D. Piper.] Many farmers would suppose that the land must be very foul; this, however, is not the case—there is scarcely a weed to be seen. I ascertained that Mr. Piper expended in labour about 4*l.* 10*s.* per acre, but notwithstanding this heavy outlay, and all other charges of rent, tithe, a top dressing of 60 bushels of soot per acre, &c., &c., the clear profit on an acre amounted to *six guineas*—not a bad return, considering that the corn was sold in free trade times, for I am now alluding to the crop of 1849. These facts may seem strange; they are, however, true, and any one who doubts them may visit the spot and have them abundantly demonstrated.—*Agricola, in the Ipswich Express.*

Notices to Correspondents.

Agricultural Engineering: *R Abbott.* Probably as good a way as you can adopt would be to write to some of those gentlemen whose papers on the subject of agricultural buildings have been considered worthy of publication in their journal by the English Agricultural Society.

Analysis: *J N M.* We do not know the "Manual of Qualitative Analysis" by R. Galloway.

Capital: *E T.* We have no doubt that the "10*l.*" authorities are right, and that those who would spend 500*l.* only on 110 acres of land—90 acres being arable—would be likely to lose their money. If a specification of the capital be required, you must be content to wait for a week or two.

Chicory: *Innishannon.* On a deeply-tilled, well manured, and clean, adhesive loam,, with a good surface tilth, sow 4 lbs. of seed per acre, in rows 12 inches apart, about the third week of May. Clean and hoe the land in summer. Pull in October; clean the roots, chop them up into dice, dry them in a malt kiln, and sell them.

Mr. Neilson's Railway: *X Y Z.* We have made inquiries.

Poultry Disease: *S X* should read the "Miscellanies" and "Notices to Correspondents," which have been lately given on this subject. We can add nothing further. We have administered a teaspoon-full of cod-liver oil, with a pinch of Cayenne in it, with apparent benefit; but cannot prescribe it as an infallible specific. *Combs: X X X.* By "flat" is meant *single,* in contradistinction to double, or *rose* combs—a difference which cannot long perplex our correspondent. Sketch No. 1 sent is an upright single; No. 2 is a drooping single comb. Sometimes when a bird is moulting, or out of health, an upright single comb will for a time become drooping and flaccid. In Spanish fowls, the cocks mostly have it upright, and the hens drooping; both have what we call flat combs. *Turkeys: L B S.* The best food for fattening them is Barley-meal mixed stiff with *milk,* if it can be spared; if not, with water. Last year's birds are excellent for table, if properly fed, kept, and cooked. If the calves' house is very dark and close, it will not do to fat turkeys in; their pen should be airy, as well as dry and quiet. What a pity it is that ladies and gentlemen making these inquiries do not confide their real names, instead of bewildering us in a medley alphabet of initials or foolish pseudonyms. *D.*

Straw: *J B H.* An ox will eat 8 or 10 lbs. of straw chaff daily, supposing him to have abundance of Turnips.—A pig of 12 score will eat 6 or 7 lbs. of meal daily, in addition to boiled Turnips.

Misc.: *Samuel Woolfield.* Will you favour us with your address. It was omitted in the letter.

Markets.

COVENT GARDEN, Nov. 9.

Vegetables are abundantly supplied, and Hothouse Grapes and Pine-apples are plentiful. Peaches are over. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. Mushrooms are dearer. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Fuchsias, Mignonette, Verbenas, Dahlias, Bignonia venusta, Stephanotis floribunda, Heliotropes, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Lemons, per doz., 1s to 2s

SMITHFIELD, Monday, Nov. 4.

Good Beasts are very scarce, and consequently readily disposed of, in some instances rather above our top quotations; but the trade generally is very bad, and inferior qualities are sold as low as ever. The number of Sheep is not large, but it far exceeds the demand; several remain unsold, and many realise very low prices. Trade is a little more brisk for Calves, the number being small. Our foreign supply consists of 1109 Beasts, 5710 Sheep, 88 Calves, and 40 Pigs.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	6 to 3	8	
Best Short-horns	3	4 — 3	6	
2d quality Beasts	2	4 — 2	10	
Best Downs and Half-breds ...	3	8 — 4	0	
Ditto Shorn	—	...

Best Long-wools .	3	2 to 3	4	
Ditto Shorn	—	...		
Ewes & 2d quality	2	8 — 3	0	
Ditto Shorn	—	...		
Lambs	—	...		
Calves	2	8 — 3	8	
Pigs	2	8 — 4	0	

Beasts, 4304; Sheep and Lambs, 28,080; Calves, 118; Pigs, 350.

Friday, Nov. 8.

The number of Beasts is a fair average, but the qualities continue middling. There is a demand for the choicest kinds, but only very few of other kinds are disposed of. Our quotations remain unaltered from Monday. The supply of Sheep is very small, the demand is equally so, consequently prices are no better. Trade is cheerful for Calves. We have from Germany and Holland 332 Beasts, 490 Sheep, 110 Calves, and 85 Pigs. 300 Beasts from the midland, and 86 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3	6 to 3	8
Best Short-horns	3	4 — 3	6
2d quality Beasts	2	4 — 2	10

Calves	2	8 — 3	8
Pigs	2	8 — 3	8

COAL MARKET.—Friday, Nov. 8.

Holywell, 15s. 6d.; Eden Main, 15s.; Tanfield Moor, 12s. 9d.; Wallsend Riddell, 14s. 6d.; Wallsend Haswell, 16s. 3d.; Wallsend Stewart's, 16s.: Wallsend Tees, 16s.—Ships at market, 171.

POTATOES.—Southwark, Nov. 4.

The Committee report that the arrivals from Yorkshire and Scotland, though not large are equal to the demand, which is dull, and it is with difficulty last week's prices are maintained. We have had very few foreign Potatoes this season, and none the last week. Present prices:—York Regents, per ton, 70s. to 80s.; Perth and Montrose do., 60s. to 65s; Fife do., 50s. to 60s.; Wisbeach and Lincolnshire do., 60s. to 65s.

MARK LANE.

Monday, Nov. 4.—The supply of English Wheat by landcarriage samples from Essex, Kent, and Suffolk, this morning was small, and the condition much worse than of late; the whole, however, was disposed of on the terms of this day se'nnight. Foreign, of which the arrivals continue considerable, met with a retail inquiry at our quotations.—Barley of all kinds fully supports the rates of last week.—In the value of Beans we observe no alteration.—Foreign white Peas must be written 2s. per qr. lower; other descriptions are unaltered in price.—The Oat trade is firm, with the exception of New Irish, which are difficult of disposal.—Foreign and country Flour continues to be held at late rates, but the sale is rather heavy.

day have been moderate, but we continue well supplied with

Friday, Nov. 8.—The arrivals of grain and Flour since Monday have been small, but this morning's market being badly attended, business in Wheat was exceedingly limited, prices of either English or foreign are consequently nominal. Barley, Beans, and Peas maintain our quotations.—Oats, particularly fine old, are the turn dearer.—Flour is held firmly, but sales are restricted. Some business has been done in floating cargoes of Odessa Wheat, at a decline of 1s. per qr., say 35s. 6d. to 36s. per pr. Galatz Maize brought 31s. per qr.

Liverpool, Friday, Nov. 1.—At our market this morning there was a very thin attendance, and we had a slow demand for Wheat, but there was no alteration made in the value of old and new; the latter is still scarce. Flour finds buyers in quantity, and prices are supported; any pressing seller is quickly relieved at a fair value. Oats and Oatmeal were each rather dearer. Barley, Beans, and Peas supported late rates. Indian Corn was quiet to-day, but it would be difficult to buy at less money than on Tuesday; the top value of the best American yellow is 30s. per 480 lbs.——Tuesday, Nov. 5.—Having an abundant show of Wheat at this day's market, and the millers extremely inactive, we experienced a very slow sale for all descriptions of English, Irish, and foreign, and if anything varied prices are slightly easier; sellers in general, however, refusing to accept lower terms, we are scarcely justified in reducing our quotations below the currency of Tuesday last. Flour continued to command a lively and extensive sale, at the rates of this day se'nnight. Malting Barley and Malt receded 1s. per qr., grinding Barley remained unvaried, Beans and Peas, meeting little inquiry, were rather lower in value, and Oats and Oatmeal, upon a moderate demand, fully supported previous rates. Indian Corn, attracting less attention than of late, has declined 6d. per qr.

GLASS FOR CONSERVATORIES, GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS AND Co., 116, Bishopsgate-street Without, are supplying SHEET GLASS, packed in 100 feet boxes, at the following *Reduced Prices*. A reduction on 1000 feet.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½ an inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

A LARGE STOCK OF SILVERED PLATE GLASS

for Mirrors, also Crown and Sheet Glass in Crates and Squares for Dwelling and Hothouse Glazing, at WILLIAM PERKS Junior, and Co.'s, Glass and Lead Warehouse, 52, Dale-end, Birmingham.

DEPOT FOR HARTLEY'S PATENT ROUGH PLATE GLASS.

MITCHELL'S MINERAL BLACK PAINT.

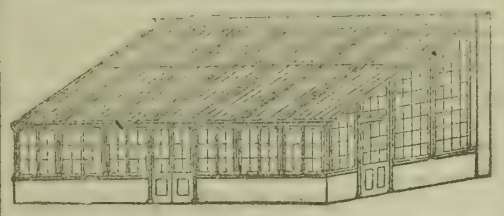
—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street Without, London.

DIXON'S NEW (REGISTERED) VENTILATOR.

—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street, Without.

Dixon v. *Bessell.—Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant 60l., and 10l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.



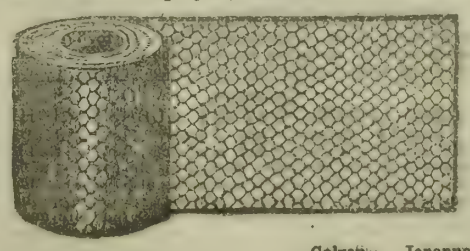
GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash: Good substantial built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l.*: 21 feet long, 13 feet wide, 50*l.*; 12½ feet long, 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, iron Handlights, Summer-houses, Seats, &c. Estimates for any branch in the above line, either in wood or iron, or for park fencing.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.



J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

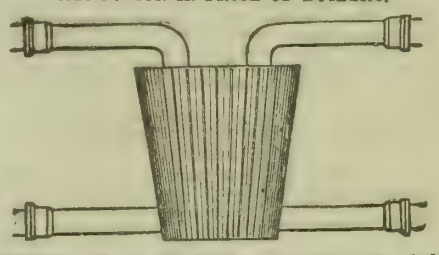
GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1½-inch „ light „ ...	8 „	6 „
1½-inch „ strong „ ...	10 „	8 „
1½-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.	30 inches wide	7½*d.* per yard.
18 „ „	4½*d.* „	36 „ „	9*d.* „
14 „ „	6*d.* „	48 „ „	1*s.* „

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

REDUCTION IN PRICE OF BOILERS.

BURBIDGE AND HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now:

All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above the same price.

130, Fleet-street, London, Nov. 9.

PURE CHINA PIGS.

—A few of these beautiful and prolific animals to be sold Cheap. Immediate application necessary, to E. S., Fair Mead Lodge, High Beech, near Woodford, Essex. To save trouble, price 1*l.* 1*s.* each.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, November 15th, 1850, at 12 o'clock, a First-Class Collection of DUTCH BULBS, consisting of the finest double and single Hyacinths, Narcissus, Jonquils, Crocus, Tulips, Ranunculus, Anemones, &c.; also Standard and Dwarf ROSES, comprising Hybrids, Perpetuals, Bourbons, Chinas, &c., together with a selected assortment of fine American Plants, and Ornamental Trees.—On view the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

IMPORTANT TO SEEDSMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. HAY, ANDERSON, and SANGSTER, to offer to public competition, by Auction, on the premises, Nursery Warehouse, Bird-street, West-square, Lambeth (in consequence of one of the partners retiring from the business), on THURSDAY, November 21st, 1850, at 11 o'clock, a large portion of their valuable Stock of SEEDS, viz., Peas, Turnip, Cabbage, Onion, Mangold Wurzel, &c.; also a large Timber erection, Tile-roof, &c.; a capital 6-inch wheel Cart.—May be viewed, and Catalogues had of Messrs. HAY, SANGSTER, and Co., Newington Butts; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

PLANTING SEASON.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith to offer to public Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, November 11th, and three following days, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of very fine Evergreens; Fruit Trees, comprising all the acknowledged and approved varieties, Ornamental and Forest Trees, Deciduous Shrubs, &c.—May be viewed prior to the sale. Catalogues may be had (6*d.* each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORNSEY ROAD.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. W. J. Pamplin to submit to public competition by Auction, on the premises, Paradise Nursery, Hornsey-road, Islington, on MONDAY, November 18th, and following day, a part of the valuable NURSERY STOCK, comprising fine Evergreens, &c.; also choice Greenhouse Plants, consisting of Double Camellias, beautifully set with bloom buds, 18 inches to 6 feet, Azalea indica, Epacris, Ericas of all the leading varieties, Chrysanthemums, &c.—May be viewed prior to the sale; Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The Nursery to be Let, with immediate possession. The remaining Stock may be taken at valuation, if required.

FULHAM ROAD.

MR. D. A. RAMSAY has received instructions from Mr. J. Shearman to submit to public competition on the premises, opposite Chelsea Park, Fulham-road, Brompton, on MONDAY, November 18, at 11 o'clock, on account of the number of lots (his lease having nearly expired), a further portion of the VALUABLE NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, and other Fruit Trees, Evergreens, Deciduous Shrubs, Ornamental Trees, Standard and Dwarf Roses, &c.—May be viewed prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneer, Brompton Auction Ground, Fulham road, Brompton, near London.

KING'S-ROAD, CHELSEA.—IMPORTANT SALE. TO NURSERYMEN, BUILDERS, AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, on the premises, King's-road, Chelsea (opposite Cremorne Gardens), on TUESDAY, November 26, and following day, at 12 o'clock, without reserve (by order of Messrs. W. Dennis and Co.), to clear about 5 acres of ground, required for building purposes, the SECOND PORTION of the NURSERY STOCK, including some uncleared Lots, consisting of about 1500 fine bushy and extra large Aucuba, Hollies, Laurels, Box, Laurestinus, &c.; the collection of Prize Gooseberries, fine Fruit-bearing and other Mulberries, Standard, Dwarf, and Pillar Roses, fine specimen Rhododendrons, Ficus, and Hoyas, extra large Ivies, Jasmines, and other climbing plants, &c.—May be viewed prior to sale. Catalogues had on the premises; of the principal Seedsmen; at the White Horse, Covent-garden Market; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

MR. HASLAM begs to inform the Public, that his first annual sale of ROSES is unavoidably postponed till TUESDAY, November 12, and two following days, when he will offer at the Auction Mart, an extensive Collection of Standard, Dwarf, Climbing, and Weeping Roses, in about 100 varieties. Also a choice assortment of Double Hollyhocks, selected from the stock of Messrs. Chater and Son; Camellias, and Dutch Bulbs, &c. Mr. H. will sell the following week, November 19, and following day, an extensive importation of Camellias, Orange Trees, &c., at the above place.—Particulars in future advertisements.

FARMS TO BE LET, WITH IMMEDIATE POSSESSION.

MR. HURLEY, FARM AGENT, &c., begs to solicit Farmers and others requiring really good FARMS, to make early application to him, as he has upwards of Fifty Farms, of every kind and size, arable and meadow, and rents to meet the times. Mr. HURLEY also begs the favour of those proprietors having such to let, to insert the same upon his Register, gratis. All applications, accompanied with four stamps, addressed to the Agricultural Agency Offices, 62, Nelson-square, Blackfriars-road, London, will meet prompt attention.

The following additional Farms are submitted, since Mr. HURLEY'S last published list of October 26, to which attention is referred—a capital Farm of 550 acres, good sound heavy land, with a fair proportion of Turnip Land, situate in Essex, three miles from water carriage, excellent dwelling-house and buildings. Rent, &c., very moderate. To be let solely from the death of the tenant.—Two Farms in Surrey, of 400 and 170 acres respectively; good houses, &c. Rents low; the latter tithe-free.—A Farm in Kent, of 220 acres, chiefly arable. Rent 135*l.*; tithe 30*l.*—An excellent Farm, of 600 acres, in Surrey. Rent 370*l.*; rates and tithes low.—Two good Farms, near Windsor, of 160 and 90 acres respectively.—A superior Farm in Essex, 18 miles from town, and four from the Harlow station, of 100 acres, equally divided, most excellent residence and buildings, and Land not to be surpassed for growing Wheat, &c.—An excellent Stock and Turnip Farm in Herts, 26 miles from London, of 526 acres; excellent residence and buildings. Rent 18*s.* per acre.

This day is published, price 5*s.*, Third Edition,

DEAFNESS PRACTICALLY ILLUSTRATED; being an Exposition of original Views as to the Nature, Causes, and Treatment of Diseases of the Ear. By JAMES YEARSLEY, Esq., Surgeon to the Metropolitan Ear Infirmary, Sackville-street. This Edition contains two new chapters:—1st, on the Pathological Connexions of the Throat and Ear (Throat Deafness); 2nd, on the Author's discovery of treating Deafness by the application of the Hydrated Cotton or Artificial Tympanum.—JOHN CHURCHILL, Princes-street, Soho: SAMUEL HIGHLEY, 32, Fleet-street, and all Booksellers.

DUTCH FLOWERING BULBS.

J. CARTER, SEEDSMAN AND FLORIST, No. 238, High Holborn, London, begs to recommend the following choice Bulbs for planting in November and December, but the earlier the better.—12 or 25 roots may be had at the rate per 100, &c.

BEES.—Wanted, in the neighbourhood of London, a Taylor's Double-bar Hive, and an improved Nutt's Hive, with strong well stored Stocks.—Address, with particulars and price, J. H., at the Office of this Paper.

FARM IN SUFFOLK.

MESSRS. HUMPHREYS AND WALLEN are instructed to LET ON LEASE a capital FARM of 480 Acres, of which 180 are Pasture, and the remainder good Corn and Turnip Land, together with excellent House and Homestead. The situation is six miles from Ipswich, with a Wharf on the Orwell, whereby corn can be delivered in London at 1*s* a quarter, and Manures, &c., obtained at little cost.—Apply to Messrs. HUMPHREYS and WALLEN, Land Agents, 68, Old Broad-street, London, and Romford, Essex.

TO BE DISPOSED OF, A NURSERY AND SEED BUSINESS, eligibly situated in a highly increasing neighbourhood, with an unexpired Lease of 22 years. Any person commanding a capital between 200*l.* and 300*l* will find this an opportunity seldom to be met with.—For further particulars apply by letter to H. B., at the Office of this Paper.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.

PRICE'S PATENT CANDLE COMPANY, Belmont, Vauxhall.

THE BIRMINGHAM CATTLE SHOW, 1850.—CLOSING OF ENTRIES.

The CERTIFICATES of ENTRY, for CATTLE, SHEEP, PIGS, and POULTRY, and copies of the PRIZE LISTS, may be had on application to the Honorary Secretary. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates. The entries close on SATURDAY NEXT, the 16th of November.

The Show will be held in the BINGLEY EXHIBITION HALL, BROAD-STREET. T. B. WRIGHT, Honorary Secretary.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

NOW SENDING OUT.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but often exhibited in our winning collections. The set may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

RENDLE'S NURSERY, PLYMOUTH, Established 1788.

WILLIAM E. RENDLE AND CO. have this season A LARGE SURPLUS STOCK of many sorts of FOREST TREES and SHRUBS. For prices see the *Gardeners' Chronicle*, November 9, 1850.

Our Autumnal Catalogue of Forest Trees, Shrubs and Fruit Trees, is just published, and can be had for one penny stamp.

Apply to WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

EDWARD DENYER is now prepared to send out his new Descriptive CATALOGUE of Roses, Fruit Trees, Evergreens, Shrubs, Ornamental Trees, &c., which will be forwarded, by enclosing two penny stamps to his Nursery, Loughborough-road, Brixton. E. DENYER informs his friends that he has no Seed-shop in London.

MYATT'S LINNÆUS RHUBARB, strong roots, 12*s.* per dozen; Myatt's Victoria, 9*s.* per dozen; and Mitchell's Royal Albert, 12*s.* per dozen. Extra strong plants of the New Red Currant "Raby Castle," 6*s.* per dozen, or 45*s* per 100; and Fastolff Raspberry, 10*s.* per 100. With the usual allowance to the Trade. Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, near London.—Nov. 16.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, beg's to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

2500 MYATT'S VICTORIA RHUBARB ROOTS.

THE above must be sold, in consequence of the Leeds Main Sewer going through part of the Grounds of JOHN SCHOFIELD AND SON, Knowsthrope, near Leeds. Large roots, 6*s.* per dozen, or 2*l.* 5*s.* per 100, for cash only.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.

A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.

Our Foreign Bulbs have arrived in fine condition.

Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Nov. 16.

DUTCH FLOWERING BULBS.

J. CARTER, SEEDSMAN AND FLORIST, No. 238, High Holborn, London, begs to recommend the following choice Bulbs for planting in November and December, but the earlier the better.—12 or 25 roots may be had at the rate per 100, &c.

*** A Catalogue of all kinds of Kitchen Garden Seeds will be published in due time. Early Peas, Beans, &c., for present sowing, may be had with the Bulbs. CARTER'S Victoria Marrow Pea equal, if not superior, to any other in cultivation for later crops, 1*s.* 6*d.* per quart.

TO BE SOLD IMMEDIATELY, 200 STRONG, HEALTHY, FRUITING PINE PLANTS, about 100 of them now showing Fruit, which will be ripe in May next; also 100 strong Succession Pine Plants, most of them fit to bear Fruit in 1851, from 2 lbs. to 3 lbs. in weight; also some fine strong Pine Suckers, all of them warranted clean, being the entire stock of a gentleman who is giving up Pine growing. They will be sold in lots to suit purchasers.

JOHN REID would be happy to engage with any lady or gentleman in want of a practical and experienced Gardener. The most satisfactory references can be given. For particulars apply to JOHN REID, Rheola, near Neath.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had gratis on application.

HYACINTHS in colours, named, for pots or glasses, 6*s.*, 9*s.*, and 12*s.* per dozen; in mixtures, 3*s.* per dozen. MIXED DUTCH CROCUS, 1*s.* 6*d.* per 100. TULIPS for early forcing, 1*s.* per dozen. SNOWDROPS, 2*s.* 6*d.* per 100. NARCISSUS, 4*d.* to 6*d* each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6*d.* each.

*** Not to be equalled by any now offered to the public.

Address—156 Cheapside, London.

MESSRS. J. AND H. BROWN offer the following desirable plants and Choice Fruit Trees.

Albion Nursery, Stoke Newington, London, Nov. 16.

FORRES NURSERIES.—The Subscribers have for Sale an over-stock of LARCH, Native Highland and Foreign PINE PLANTS, of various ages, healthy, well-topped, and of the best description; also a full stock of FOREST and FRUIT TREES, and SHRUBS, at greatly reduced prices. All the premiums hitherto awarded by the Highland and Agricultural Society of Scotland for the cultivation of the true Native Highland Pine have been received by the Subscribers. Priced Lists will be furnished on application, and the Trade supplied at the wholesale rate.—JOHN GRIGOR & Co., Nurseries, Forres.

ARAUCARIA IMBRICATA.

JAMES CHARTRES, SEEDSMAN, 74, King William-street, City, London, has just received a large quantity of SEED of the above valuable Plant, which he can offer at 5*s.* per lb., averaging about 160 Seeds.

J. C. takes this opportunity to state that at his Establishment will be found a choice Collection of DUTCH FLOWER ROOTS, and Seeds of every description, at the lowest remunerating prices. Catalogues can be had on application.—Nov. 16

RUSSIAN VIOLETS.

R. SHACKELL, in offering his two superior new Violets, "RUSSIAN SUPERB," and "WHITE RUSSIAN" (of which all the Floricultural Publications have spoken in the highest terms), begs to call the attention of Amateur and other Cultivators, to the following reduced prices, at which he can now sell these favourite flowers:—Extra strong blooming plants, "Russian Superb," 12*s.* per doz.; small ditto, such as could be sent by post, 9*s.* per doz.; "White Russian," 6*s.* per doz. Any parties can have a bouquet of each, postage free, by enclosing 12 postage stamps. R. S. has eight other varieties at 3*s.* per doz.

"SIR,—Blooms of your 'Russian Superb,' and a large White Seedling Violet, both seedlings of your raising, were safely received this morning. Having grown a few plants of the 'Russian Superb' myself this season, I have no hesitation in informing you I consider it by far the best hardy Violet cultivated. It blooms most profusely through seven months of the year. The blooms are very large, of a fine blue colour, and most exquisitely fragrant; and as the habit of the plant is strong and good, it must supersede the old varieties. It is well known the Neapolitan requires the shelter of a frame to bloom it in perfection; your present seedlings will enable every one to enjoy the luxury of these charming flowers, without the aid of glass, through the winter months. The 'White Seedling' appears equally in advance of the old kinds, both in size, colour, and fragrance, and is equally to be recommended. As no lover of these flowers ought to be without them, I hope the public will patronise these pets of yours, for they are really good things. — I remain, Sir, yours very truly, JOHN SPENCER, Bowood Park, Nov. 13."

"MR. ROBERT SHACKELL, Locksbrook Nursery, Bath."

Locksbrook Nursery, Bath, Nov. 16.

FRUIT TREES.

R. GLENDINNING possesses a large stock of all the most valuable kinds, which have been proved as such in the Garden of the Horticultural Society of London, in a perfectly healthy condition, fit for immediate planting, adapted either for walls or espaliers, standards and half standards, trained and untrained, all correct to name, the nomenclature of the Horticultural Society being strictly adhered to.—Catalogues may be had on application.—Chiswick Nursery.

MESSRS. KNIGHT AND PERRY feel themselves called upon to offer their most grateful acknowledgments for the confidence with which their numerous Patrons have recurred to them when in want of GARDENERS, and beg most respectfully to state that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable), is, if possible, increased now; and that the steps they take to arrive correctly at the private as well as the professional character of those they send out as Gardeners, Foresters, Bailiffs, &c., induce them to engage, unhesitatingly, to furnish first-rate men in these capacities whenever called on to do so.

Exotic Nursery, King's-road, Chelsea, London.

TO PLANT GROWERS.

GREENHOUSE PLANTS.—The Advertiser would be glad to purchase a few handsome SPECIMENS of moderate size. Any one having plants of this character (New Holland ones preferred), will oblige by forwarding exact description and price to W., Box 60, Post-office, Manchester.

"GEM OF THE GROVE," DAHLIA.

J. SODEN AND SON beg to offer the above New DAHLIA to the trade in fine ground roots, at 3*l.* 10*s.* each. Colour, maroon of the richest and darkest shade, very double, symmetrical, and full; medium size, always true, full centre, and constant in every respect, first-rate habit; height 4 feet. It has been successfully exhibited, and obtained 7 first-class Certificates, including the Royal South London.

Remittances will be required from unknown correspondents. Orders taken at Hurst and M'Mullen's, 6, Leadenhall-street; and at the Grove Nurseries, Middle Barton, near Woodstock.

Nov. 16.

J. HENCHMAN begs to inform the trade that he has a large stock of very healthy Seedling CEDRUS DEODARA in pots, 4 to 5 inches, at from 8*l.* to 10*l.* per 1000.

Edmonton, Nov. 16.

SPECIMEN PLANTS.—The Surplus Stock of an Amateur, about 36 large plants, comprising Azaleas, Ericas, Kalosanthes, New Holland Plants, &c. &c.; the owner not having sufficient room for them, they will be sold at a moderate price.—Apply to R. Hook, 2, South Island Place, Clapham-road, Surrey.

SEED POTATOES FOR SALE.—The undersigned begs to offer the following sorts, warranted free from disease.

True Ash-leaved Kidney, per bushel of 70 lbs.	...	9*s.* 0*d.*
Haigh's Seedling do.	do.	... 9 0
Scotch Seedling Round do.	do.	... 4 6

Sacks included.

Delivered at the nearest railway station, on receipt of post-office order for the amount.

THOMAS SIMPSON, Oak-tree Inn, Leeming-lane, Bedale, York.

HILL'S COURT NURSERY, EXETER, within 3 minutes' walk of the London Inn, and 10 of the Railway station.—The FORD OAK, the hardiest of all evergreens, was originally raised at this Nursery, and there are at present upwards of 500 Plants in pots, from 3 to 10 feet high. Also a very large collection of LUCOMBE OAK, varying from 3 to 15 feet high, and of superior growth. To be sold at a great reduction in price.—All letters to be addressed to Mr. JOHN NOTT, at the Nursery, and Post-office orders payable to him. Dated HILL'S COURT NURSERY, November 10, 1850.

TO BE DISPOSED OF, a Nursery and Seed Business in the neighbourhood of Croydon, about 7 acres of Nursery-ground, with five Greenhouses, three ranges of Pits, and good Dwelling House. The Nursery is stocked with a general collection of Trees, Shrubs, &c. To be taken at a valuation. Apply to R. C., at Messrs. Noble, Cooper, and Bolton's, 152, Fleet-street, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes of various sizes. In all cases, unless the whole box is taken of either size, extra must be charged as specified.

12*s.* 6*d.* per box; or 2*d.* per foot if less than one box be taken:

6 inches	by 4 inches.	6½ inches	by 5 inches
6 ,,	by 4½ ,,	6½ ,,	by 5½ ,,

GLASS TILES AND SLATES made to any size or pattern.

HALLIMAN'S REGISTERED FRUIT PROTECTORS, from 6*d.* to 1*s* each.

MILK PANS, from 2*s.* to 6*s.* each.

PROPAGATING AND BEE GLASSES, from 2*d.* each.

WASP TRAPS, 3*s.* 6*d.* per dozen.

LACTOMETERS, for trying the quality of Milk, 7*s.* 6*d.* each.

STANDS, for Pianofortes, 1*s.* each.

Glass Shades for Ornaments. Parian Marble. Wax and Alabaster Ornaments. Lamp Shades and Glasses. Patent and British Plate. Ornamental and Stained Glass; and every article in the Trade.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street Without.

Dixon v. *Bessell.—Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant 60l., and 10l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

GREEN AND HOTHOUSES made by Machinery, warranted best materials, glazed 16-oz. sheet glass, of a large size, with glass at both ends and one door, painted three coats of best oil-colour, and delivered to any Railway or Wharf in London.

Lean-to.				Unglazed.			Span-roofed, glass all round. Glazed.			Unglazed.			Height in front, 3 feet 6 in., wood and glass; 3 feet 6 in. brickwork.

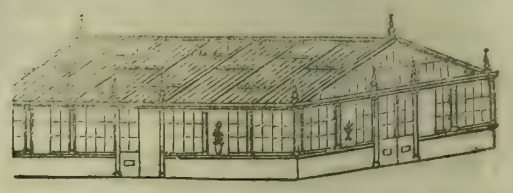
These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.



Estimates for erecting and heating the above, on application. Lists of prices for Sash-doors, &c., post-free on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash: Good substantial built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 20*l.*; 21 feet long, 13 feet wide, 50*l.*; 12½ feet long, 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Handlights, Summer-houses, Seats, &c. Estimates for any branch in the above line, either in wood or iron, or for park fencing.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

RABBIT NETS, SHEEP NETS, FISHING NETS.—Long Hare and Rabbit Nets, on Cords, 50 to 100 yards long, for catching Rabbits, Shooting, &c., dipped in Kyan's Preparation to prevent decay. Strong New Zealand Cord, or Cocoa-nut Fibre, Sheep Nets, 4½*d.* per yard, 4 feet wide. All kinds of Fishing Nets, for Home Use or Exportation, made by Machinery.

A. RICHARDSON, 21, Tonbridge-place, New-road, London.

WATERPROOF CAPES AND COATS.—Large-sized Waterproof Capes to effectually keep a man from wet while stooping down, 3*s.* each; 3000 second-hand London Police Capes, fresh dressed, 18*s.* per dozen, for farm servants; India-rubber Coats, 7*s.* 6*d.* to 10*s.*; large Driving Aprons, with straps, 12*s.* each; Horses' Loin Cloths, with straps, 7*s.* for Shaft Horses, and 9*s.* 6*d.* for Trace Horses. Tarpaulings, dressed with India-rubber, for Carts, Waggons, &c.: 1*l.* for Millers' Carts, and 26*s.* for Waggons, or 2*s.* per square yard when made up. Roofing Felt 1*d.* per square foot. Packing Canvas, &c.—R. RICHARDSON, 21, Tonbridge-place, New-road, London.

SUBSTITUTE FOR GARDEN MATS, TARPAULING, &c.—THICK SHEETING, dressed with a composition, admitting light to Plants and excluding frost, 6*d.* per square yard; or 1*s.* per yard two yards wide. This is recommended for covering Greenhouses, Pits, and Frames; for fumigating Cloth, preserving Blossom of Fruit, and also for shading in summer. It will outlast two Mats, keep out more cold, give light (which is so desirable), and is nearly the same price as Mat. Also Tarpauling, two yards wide, 1*s.* per yard, or half the width 7*d.* per yard.

N.B.—Strong Canvas Frame Cover, 2*s.* per yard two yards wide. Patent Felt, 1*d.* per square foot.

ROBERT RICHARDSON, Net, Tent, and Tarpauling Maker, 21, Tonbridge-place, New-road, London.

WIRE FENCING, painted, an effectual Fence against Hares, Rabbits, Sheep, Cats, Dogs, Deer, &c., also for enclosing Pheasants, Fowls, &c.; for heightening existing walls, fences, &c. and as a protection against petty thieves. 15 inches high, 3*d.* per yard; 18 inches, 3½*d.*; 2 feet, 4½*d*; 3 feet, 6¾*d.*; 4 feet, 9*d.*; and 6 feet, 1*s.* per yard; less than 2 inch mesh. Being worked in oil, it will not rust when painted, and will last twice as long before it requires repainting as any other kind of wirework that is made. Also, Sparrow-proof Wirework, 2*d.* per square foot; Wirework, 4 inch mesh, ½*d.* per square foot. Wirework to order. Numerous testimonials of approval.

R. RICHARDSON, 21, Tonbridge-place, New-road, London.

N.B. As this wire, kept painted, would last 20 years, farmers and others may, at a small expense, preserve their crops from hares and rabbits.

TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES.

C. LODDIGES AND SONS beg most respectfully to inform the above, that in consequence of the land upon which their celebrated Arboretum is planted being required for building purposes, they are determined to offer the STOCK at such a reduction in price (for cash only) as cannot fail to attract the attention of all who are engaged in extensive ornamental planting. The trees are of the finest description, and range from 6 to 10 feet high.

Hackney, Nov. 16.

LATE SEEDLING GOOSEBERRY, "NEGRO BOY."
Two-year plants, 5s. each; one-year do., 3s. 6d.

JOHN WILLISON can supply the above splendid GOOSEBERRY, which has been tested by hundreds with the best varieties. Two dishes were shown at Whitby on the 24th Sept. last, for which an extra prize was awarded. The following extracts are selected from the editors' opinions.

Gardeners' Chronicle, Sept. 15, 1849.—"*J. W.* Late seedling Gooseberry, dark red, rich flavour, and would doubtless be good for preserving. It retained its flavour during carriage better than is generally found to be the case with Gooseberries."

Midland Florist for October.—"Willison's Negro Boy Gooseberry. We have this day (Sept. 18) received specimens of the above fruit; though not large, yet the lateness of its season renders it a valuable acquisition for the dessert. The specimens were perfectly smooth, of fine flavour, and a very dark colour; in fact, as they lay in the box, packed in cotton wool, they looked more like Damsons than Gooseberries."

Gardeners' and Farmers' Journal.—"*J. W.* We pronounce this winter Gooseberry excellent, and, for so late in the season, of an exquisite flavour."

STRAWBERRIES.—A few of the best varieties, viz., Cuthill's Black Prince, 10s. 6d. per 100; Kitley's Goliah, 10s. 6d.; Myatt's Eleanor, 5s.; British Queen, 3s. 6d.; Keens' Seedling, 3s.; Elton Pine, 3s.; Swainston do., 3s.

RHUBARB.—Victoria, 6s. per dozen; Royal Albert and Linnæus, 8s. per dozen.

The usual discount to the trade. All orders made payable to JOHN WILLISON, Flowergate, Whitby.

The Gardeners' Chronicle.

OUR readers will remember the statement lately made concerning the great VINE at Cumberland Lodge; and an allusion then made to concreted borders. By the latter it was not intended to disparage the method, which is excellent in some situations, although needless in others; had it been otherwise we should nevertheless have found no cause to regret having raised the question, seeing that it has produced the following excellent letter from Mr. FLEMING.

"In a leading article, at page 691, allusion is made to concreting Vine borders below, to prevent the roots from going into an unsuitable subsoil, and as this is a favourite plan of mine, and has been extensively adopted here, not only for Vines, but for many other kinds of fruit, on a soil where they did not flourish, I am anxious to say a few words on its merits, lest it should be classed among the 'unnatural and unnecessary' systems, which your correspondent mentions.

"At the conclusion of the article, you correctly state, that the Vine's chief desire is a warm, light, dry, shallow border; in short, similar to the soil in its natural state, in many parts of the country; and particularly in the neighbourhood of the two famous Vines mentioned in the same paper, where the Vine flourishes so well, as in the case of that at Cumberland Lodge, as to render having recourse to artificial borders unnecessary.

"Mr. WILMOT'S Vines grow in a strong, rather clayey mixture, and there are some dung linings near, from which they receive much nutriment; but he has found them do well planted in any part of his grounds. Mr. PATRICK, at Stoke Park, near Slough, gets fine Muscats from a Vine planted in the back path of a house, and that without any other preparation than merely digging or picking a hole, for it is a hard dry bottom, putting the plant in, and watering it. These facts merely prove that a hard clay, as at Cumberland Lodge, is not a bad bottom for Vines, any more than is the compound of flint, chalk, and clay at Stoke Park. But, if the drainage in these cases had not been perfect—how would the matter have stood? The subsoil, although in some cases of a clayey nature, and in others a hard conglomeration of gravel, chalk, and flint, is full of natural fissures, which quickly drain the soil, and admit the roots to their sides, where they cling with their thousands of minute points, ready to absorb the nutriment carried down by rains; under which circumstances, the more rain the more food for the Vines, and without any souring or stagnation of the soil. It is scarcely necessary to say that in other parts of the country, the Vine has to contend with damp retentive soils, which, even when drained, are not favourable to the production of well-coloured or highly flavoured Grapes; and gardeners are compelled to have recourse to various means of remedying such evils, some of which methods, it is true, are both expensive and unnatural. I shall only treat now of the plan which we have adopted here, and with which, after nine years' experience, we are perfectly satisfied. Had the Vines done well on our soil, there would of course have been no necessity for going to the expense of forming a prepared bottom to keep the roots out of the subsoil, but the reverse of this was the case; we adopted the plan of concreting, which we find to be the cheapest and most effectual, and the material can easily be procured in any part of the kingdom. The mode of preparing it, and the quantities of gravel and lime, are stated in former numbers of the *Chronicle*.

"Any of your readers who may be under the necessity of making artificial bottoms for their Vine borders, will do well to consider the following circumstance, which lately came under our notice. In one of our houses which has been planted eight years, the black Grapes have not coloured well this season; and as the border was well made, and rested upon well prepared concrete, having a declivity to throw off the wet quickly, we were much disappointed. We opened the ground in front of the border, and the cause of the Grapes not colouring was immediately discovered; the roots had got into the drain, and across it into the subsoil beyond the concrete. Now if any proof was wanted to show that our subsoil is unfavourable to the production of good Grapes, here was one. The Vine will grow in almost any soil, but it will not produce good Grapes, in some situations, even when drained; and the only thing to do in such cases, is to prevent the roots from going into it, and to make the border of the best material within reach. In making any more new borders, I have determined to allow the Vines only a few feet to grow in the first year, and frequently to break off the points of the leading roots, to cause them to fill the border with fibres as they advance. Additions shall be made by a little at a time, and the result will be shorter-jointed wood, and compact bunches of well swelled fruit. After the border is finished, and the Vines have filled it with roots, we shall assist them when necessary by liquid manure, and top-dressings of light rich mixtures, which should be applied in the autumn; at the same time removing the soil from the front and ends of the border down to the concrete, and shortening back all roots which are going over the edge. The late autumn and winter rains should be kept from penetrating the border; the cheapest way of doing this is to lay a few dry leaves over the surface, and then thatch with straw, or cover with a tar cloth. Concreting the surface has been abandoned, not because the fruit obtained during its use was not equally good, but on account of its appearance in summer, and the effect produced on it by frost in winter, which rendered it necessary to cover it with as much litter as would have protected the roots from cold and wet, without the assistance of concrete.

"I have now, I believe, gone into all the matter of the concreting alluded to by your correspondent; and I hope that the authors of the other systems mentioned by him will come forward and defend the practices they have recommended, wherever they feel they are right, and candidly confess where they were wrong. A little discussion upon Vine culture, after the long silence that has been observed on the subject, will be both entertaining and instructive. With regard to large Vines, they are easily obtained. Give them plenty of room—a house to one Vine to begin with, and enlarge this, and extend the border as required, and they will soon become large enough; but avoid early forcing and heavy cropping for at least the first 10 years. Were this done the large Vines at Hampton Court and Cumberland Lodge, fine as they certainly are, would no longer appear so wonderful. Where a family has to be supplied with a succession of Grapes it would be inconvenient to have very large Vines; but we are beginning to allow only one to a house, instead of one to a rafter. It is natural to a Vine to cover a large space, and the more room that is given to it the stronger and more lasting will it be, and the greater the quantity of fruit which it will bear without injury."

In these observations we entirely concur; and we recommend them to the attentive perusal of all Grape growers, young or old. As to the Cumberland-lodge case, it would not be incorrect to say that the border there rests upon natural concrete; so hard and impenetrable is the subsoil upon which lies the light material in which the roots are found. It is the more necessary to point this out, because we find correspondents inquiring whether Vines may not be planted in borders consisting *entirely of clay*. We had hoped that all gardeners were by this time aware that mere clay is one of the most unfit of materials for any purposes of cultivation whatsoever. When it is largely mixed with friable or porous matter, such as cinders, lime rubbish, charcoal, straw, sticks, stones, broken bricks, and similar materials, it acquires highly valuable qualities, but as mere clay it is perhaps the worst material known to cultivators.

A CORRESPONDENT asked us lately whether WALNUT TREES could be grafted, and how? Two or three similar inquiries having been since made, we are led to suppose that the question is one of general interest; as indeed it well may be, considering the frequent and very general failure of the Walnut crop in this country, owing to the varieties in cultivation not being hardy enough to ripen fruit properly in our cold summers. We, therefore, at once lay before our readers what is known or conjectured upon this subject, instead of delaying till the spring, when it may be forgotten or thrust aside by other topics.

There is a general opinion in this country that the Walnut tree cannot be grafted. English nurserymen sell seedlings only, which vary from plant to plant, in the period of their ripening and in the quality of their fruit; in their timber alone is there any uniformity. Nevertheless there is no great difficulty in performing the operation of grafting; and therefore buyers are justified in expecting varieties of this nut to be offered to their choice in the same way as Apples or stone fruit. There is no sufficient reason why thin-shelled, early, late, large, and small Walnuts should not be propagated with the same certainty as Ribston Pippins and Codlings. In fact, they are so propagated in the Continental nurseries, where they may be bought like other fruit trees. The French distinguish among others the *Mésange*, or Tomtit nut, so called because the shell is so thin that this bird pierces it to get at the kernel; the *Late*, which never flowers till frosts are over; the *Noix de Jauge*, a large coarse sort well known in this country as the French Walnut; the *Long-fruited*, of excellent quality, and a great bearer; and the *Cluster*, so called because its nuts hang in bunches 15 or 20 together; besides which, they have a *prolific* sort which bears in the second year, and which they call *Præparturiens*. This last was produced in 1837 by M. ANDRÉ LEROY, the well-known nurseryman of Angers. We should think it would be a fair speculation to procure from some respectable continental dealer a supply of grafted Walnut trees for sale here. Care however would have to be taken that they are really grafted; for we perceive that seedlings of the *prolific* variety above alluded to are this year offered by M. LEROY himself at 4*l*. per thousand!

We believe that the first person who succeeded in this country in grafting the Walnut was the late Mr. KNIGHT, who described his method in the following manner.

"The fluid which the seeds of the Walnut-tree contain, when that is fully prepared to germinate in the spring, and which was deposited within it for the purpose of affording nutriment to the seminal buds, or plumule, in the preceding autumn, is sweet, as in a great many other kinds of seeds: but during germination this becomes, in the seed of the Walnut-tree, bitter and acrid. Similar changes take place in the sap which is deposited, for analogous purposes, in the bark and wood of the Walnut-tree, during the germination of its buds; and I was led by the discoveries of M. Dutrochet to infer the probability, that the sap during, and subsequent to, its chemical changes, might acquire new and more extensive vital powers. I therefore resolved to suffer the buds of my grafts, and those of the stocks, to which I proposed to apply them, to unfold, and

to grow during a week or ten days; then to destroy all the young shoots and foliage, and to graft at a subsequent period. A very severe frost in the morning of the 7th of May saved me the trouble of destroying the young shoots; but it deranged my experiment, by killing much of the slender annual wood, which I proposed to use for grafts; so that I found some difficulty in choosing proper grafts. The swelling of the small, and previously almost invisible, buds, within a few days enabled me to distinguish the living wood from that which had been killed by the frost, and the stocks were grafted upon the 18th of May. My grafter had more than once been previously employed by me to graft Walnut-trees in various ways, and never having in any degree succeeded, he did not seem at all pleased with the task assigned him, and very confidently foretold that every graft would die: and I subsequently found that he had insured, to some extent, the truth of his prophesy, by having applied grafts which were actually dead. The whole number employed was 28, and out of these 22 grew well; generally very vigorously, many producing shoots of nearly a yard long, and of very great strength; and the length of the longest shoot exceeding a yard and 5 inches. The grafts were attached to the young (annual) wood of stocks, which were between 5 and 8 feet high; and in all cases they were placed to stand astride the stocks, one division being in some instances introduced between the bark and the wood; and both divisions being, in others, fitted to the wood or bark in the ordinary way. Both modes of operating were equally successful. In each of these methods of grafting it is advantageous to pare away almost all the wood of both the divisions of the grafts; and therefore the wide dimensions of the medulla in the young shoots of the Walnut-tree do not present any inconvenience to the grafter.

"No difficulties will henceforth, I conclude, occur in propagating varieties of Walnuts by grafting; and I am much inclined to believe, that different species and varieties of Oaks may be successfully grafted by the same mode of management."

The French graft the Walnut in a variety of ways, especially preferring ring-grafting. They find it necessary, however, that the sap should be in full flow, whatever the method they employ. Their way of ring-grafting is this. When the sap is running freely they remove from the scion a ring of bark on which there is a good bud; and it is immediately transferred to the stock, from which a similar ring has been taken; of course the ring must be divided on the side away from the eye, in order to get it round the stock. When it is properly fitted, the lips of the wound and the edges of the ring being accurately adjusted, the whole is secured with grafting wax, prepared by melting together $\frac{5}{8}$ of pitch, $\frac{1}{8}$ resin, $\frac{1}{8}$ yellow wax, $\frac{1}{8}$ tallow, with the addition of as much fine brick-dust as will give it consistence; it is used as hot as the finger can readily bear it. This sort of graft is never tied. In this way the French succeed in grafting old trees which have been headed back; but they, in such cases, operate upon the shoots which such trees throw up from the pollarded head.

In addition to these modes we would suggest the trial of herbaceous grafting, the best of all in theory, and by far the best in practice also, where circumstances admit of its application. But, perhaps, some of our correspondents have had practical experience in this matter, in which case, we dare say, they will favour us with the result.

GARDENS IN THE NORTH OF ENGLAND, SCOTLAND, AND IRELAND.—No. II.

The new rockwork at Chatsworth is very well executed—perhaps no made rockwork could be better, especially the cascade falling from the highest point. The parterre gardening does not seem to be very choice nor much attended to: this is a defect, I think, in so vast a place, and when so much is spent on the gardens. All which is attempted should be perfect. I observed one bed of a variety of the China Rose (Barclayana), which I believe is little known: it is very handsome and a free bloomer. I remarked also a sort of edging to one of the fountains a kind of hedge of the Turkey Oak, kept low (about 2 feet from the ground.) The foliage was very rich, and it seemed admirably adapted for the purpose; the gardener told me it was renewed every five or six years by planting Acorns to produce young plants.

I say nothing about the house for the Victoria Regia, as it has been so lately described in the *Gardeners' Chronicle*.

Mr. Alcard, whose collection of Orchidaceous plants, near London, was well known, has built, near Chatsworth, a beautiful mansion, attached to which is a handsome conservatory, and permission to see this was very kindly granted. The collection of Orchids has not yet been removed here. The most remarkable thing was a wall or fence at the back of the conservatory, which is very high. There was placed, about 2 inches from the wall, a zinc wire netting, filled up with common moss, and in this were planted various kinds of hothouse Ferns, Lycopodiums, and a few Orchidaceous plants, though it is not probable that it will be possible to cultivate well here the more delicate kinds; yet there were good plants of Stanhopeas, and a Vanda Roxburghii in flower.

I do not think I ever saw a more beautiful and interesting mode of growing Ferns; and, if it were not for the fear that the large mass of wet moss would be a very tempting harbour for various kinds of insects, I should say that no Orchidaceous house should be without the walls so ornamented; that is, where there are such things as back walls and lean-to houses, which I hope will soon cease to exist, in these days of cheap glass and cheap warming.

At Edinburgh I visited the Botanic Garden, which is open to the public; it is well laid out, and surrounded by masses of beautiful evergreen and other trees. When the *Gardeners' Chronicle* first started, I made some observations as to what a botanic garden should consist of, and you promised you would take up the subject, but you have not yet done so. The subject is important, and I am sure there is room for improvement. Hitherto, I never saw one which was of much use, especially as regards the stove and greenhouse department, in which there is never any systematic arrangement, and they generally are little else than a mass of ill-grown plants. And as regards the stove and greenhouses in the Edinburgh Botanic Garden, I do not think these are exceptions. There was a small collection of Orchidaceous plants, not very well grown; these were in a house with I believe a northern aspect; as far as I could judge, they are not much cared for, and I suspect not in all cases rightly named. There was a good plant of Zygopetalon maxillare in flower.

The rules for admission to the houses are not so liberal as at Kew, they being open to the public only one day in a week, and as my visit was not on that day, I flattened my nose for some time at the window of one of the houses, in vain trying to coax one of the men to open the door to take a request to the Curator for permission to see the houses. Luckily meeting a gentleman who appeared acquainted with the garden, I sent in my name, and got leave to go over the houses. Mr. M'Nab should pay a visit to Kew, and then probably he would make more liberal rules for seeing his plants. I should mention that on my way to Edinburgh I stopped at Newcastle for the purpose of seeing the Orchidaceous plants of the indefatigable collector, Mr. Wailes. Although he does not attempt to grow many large specimens, so as to rival the great collections which appear at the Chiswick and Regent's-park Shows, he seems to have one or more specimens of everything that is good, and many rare or new: he is in the receipt of new plants from all quarters. It occurred to me that more heat, light, and air, would be an improvement in his mode of growing his plants; but I am quite aware it is not for me, a mere tyro, to seem to teach so experienced a cultivator, yet, I suspect that the true mode of growth of all, except such as come from a very temperate climate, is from March to grow them in as much light, air, moisture, and heat, as can be managed (guarding against the sun scorching) and so to get the growth of most of the plants completed by the end of August, and thereby to be enabled to give them a long rest. In the different collections I have seen on my tour I think that this is not sufficiently attended to.

Nothing could be more princely than the gardens at Dalkeith, both in the fruit and the flower department. I observed a mode of training the Peaches in the Peach-house which appears excellent as regards economy of space, especially in the growth of trees on the back wall. I had not time to take an accurate note of this, but it would be worth your while to get a description, which will, I think, be useful to your readers. The wood appeared in excellent order; the kitchen and flower gardens extend over about 20 acres. The collection of stove and greenhouse plants was extensive and in excellent order. The collection of Orchidaceous plants is also very large—I believe one of the largest, if not the largest private collection in this country. The plants appeared to be well grown, and to have had plenty of light, though, as I have before observed, I think even these would have been better if they had been grown during the summer in more heat. My observations particularly apply to Saccolabiums, Vandas, and Aerides, but I am aware this is *questio vexata*, and that skilful growers prefer in all cases a low temperature. The gardens here, as at Chatsworth, are shown with the greatest liberality. There appeared on the hot walls a very tolerable crop of Pears, but I did not ascertain what were the kinds which succeeded best in that climate. *Dodman.*

VILLA AND SUBURBAN GARDENING.

Those who garden in a small way, will now be put to great inconvenience in attempting to save those plants from frost that have rendered their gardens gay during the past season. Such as have pits, greenhouses, and other contrivances artificially heated will, doubtless, have better and safer means of protection than those who possess nothing of the kind. It is an error to suppose, however, that the majority of tender ornamental flower-garden plants require heated buildings to protect them from frost—thousands of such plants may be kept perfectly secure without the aid of brick or wood frames and glazed lights. But there are a few particulars regarding this subject, that must be especially explained.

Plants that are intended for next year's decoration in the flower garden, and where no structures exist combining stability accompanied with the means of supplying artificial warmth, require preparation for a state of dormancy, which is the main point to be attended to; growth is not required, indeed such would be highly injurious. The necessary preparation consists in the hardening of the shoots; a perfectly ripened shoot, from which the sap is in a great measure expelled, never suffers from frost like one full of juice and with a superfluity of soft spongy foliage. Specimens which have been growing in the open border will, of course, be in such a condition. The getting rid of the redundant foliage, and maturing the soft stems, are the chief objects to be effected, and in this, as I have already stated, lies the only chance of their being wintered alive. If the pit is constructed merely of turf, in the usual form, with an inclination to the south, the sides being 15 inches thick, the plants, when dug out of the beds, should be dried for a few days in the sun, in order to check their vigour; a ball of soil being retained around the root; it is not necessary that the plants should be potted; when they have undergone this preparation a quantity of dry sandy soil should be in readiness, and this, intermixed with an equal portion of sifted coal ashes, will form a good material in which again to plant them, in the pit. When planting is completed, be careful in exposing them on all dry days, and diligent in protecting them during wet weather, for on this hinges your success. Temporary frames covered with asphalte may be readily removed and replaced over the plants as the nature of the weather demands; during intense frost an additional covering of straw or litter will be required. Should the plants get drenched with wet, and frost succeed, no protection can save them; more particularly, if severe weather continues for any length of time. Getting them in the first place to part with a large portion of their watery nature, partially denuding them of their rank foliage, placing them in the dry material above recommended, and keeping them protected from wet, will secure and fortify them against immediate injury from frost. Under such conditions they may be kept securely covered for weeks together, without receiving serious damage; and by gradual exposure, as the spring advances, they will begin to exhibit signs of growth, so that when the period of planting out arrives, they may be transplanted with safety, and will suffer less from exposure than plants taken from greenhouses. *Pharo.*

BRITISH SONG BIRDS.

No. V.—We have now to consider minutely the essentials necessary for fitting up the interior of an aviary; for on the completeness or otherwise of the internal arrangements, do the comfort and happiness of your birds depend.

First, of the flooring. My flooring was of wood, laid on sleepers, and elevated some considerable distance from the ground. The unsuitableness, however, of a wooden flooring, has recently been rendered apparent by the total destruction of all my feathered family by an army of rats, who, at midnight—assassin-like—made their way through the floor, and conveyed away their innocent victims one by one from off their perches.

For full particulars of this murderous onslaught, reference can be made to the *Gardeners' Chronicle* of January 12 in the present year, p. 22. In the same Paper, bearing date February 9, page 87, will also be found vividly recorded the reception I gave the enemy, ending in their total annihilation. I had a grand cause for quarrel, and I amply revenged myself. If ever revenge was lawfully sweet, it was then.

I should recommend that the flooring be of thick tiles, about 12 inches square each, and made of brick earth.* This would effectually prevent the entrance of vermin. The walls all round the room should be cased with floor-cloth, of a white marble vein, with a black pattern on it, in the form of a large diamond. This looks remarkably well, both in summer and in winter; and it can be readily cleaned with a sponge and warm water.

In each of the four corners of the room, about 12 inches from the windows, a square upright pole, 9 feet long and $1\frac{1}{4}$ inch thick, should be let into the floor, and carefully secured by nailing the feet to the ground. To steady these, at their summit, round perches of sufficient lengths, and of a quarter of an inch in thickness, should be nailed, one upon the top of each. This will form a kind of rail all round the room, leaving the centre open, so as not to interfere with the grand fountain which will be in the middle. On these lofty perches the birds will, for the most part, roost. Indeed, in the winter, they will always use them for roosting on. The cause is evident. Being immediately below the ceiling, and not exposed to draught, they will sit warmly, cosily, snugly—defying the most severe frosts.

Through the four square upright poles, round perches, 4 inches long, and of half an inch calibre, should be inserted, at a distance of 5 inches apart, every alternate perch being let in transversely. This arrangement will prevent the plumage of the birds

* A correspondent under the signature of "X. Y. Z., Hants," says, in the *Gardeners' Chronicle* of February 5, p 70, "Every one who has read Mr. Kidd's lamentable narrative of the destruction, by rats, of his beautiful and unique aviary, will deeply sympathise with him. The loss is not only great to himself but to all who love nature. * * * If Mr. Kidd had laid down a bed of shingle or rough gravel from 6 to 10 inches in depth beneath the floor of his aviary, no rat could have reached him. They cannot burrow in shingle. I have tried it beneath the floor of a barn here, and it has effectually kept this vermin out."

being unnecessarily dirtied by those which are sitting the one immediately over the other, as they will do in the day time, when they are singing. Another rail of round perches, a quarter of an inch thick, should run all round the windows; they should be about 5 ins. from, and immediately level with, the bottom of the lower panes. The birds, by this plan, will be readily and constantly seen from the dwelling-house, and the variety of their colours will be shown to great advantage. The beauty of the latter will be materially enhanced by reflection and refraction in the looking-glasses, of which I shall presently speak.

At the back of the aviary, 5 inches distant from the wall, a long round perch, half an inch thick, must run from end to end. All the perches must be painted over four times at least, in the best green colour, and be thoroughly dry before they are fit for use. Round the ceiling there should be a neat moulded cornice; and a narrow skirting-board, painted stone colour, all round the bottom of the room.

The door of entrance, which should be of glass, must be at one end of the aviary, and must open outwards; over it the double window before spoken of, also opening outwards. Just within the glass door should be constructed a three-sided mahogany frame-work or partition, 14 inches deep, having a painted shelving top of wood. The front should form a door opening inwards. This partition should be faced with closely-meshed galvanised iron wire, and the door of it never opened until after the outer door has been closed, and *vice versa*. By adopting this precaution none of the inmates can escape.

The next thing to be considered is the fountain. This should be of zinc, and its circumference about 18 inches, with a turnover lip, and sides gradually shelving downwards to the depth of about 4 inches. The position of the fountain should be immediately in the centre of the room. To carry off the superfluous water, a waste pipe should pass through the wooden support of the fountain and under the floor; a second pipe, similarly introduced, would carry off the foul water every morning, by the withdrawal of the plug attached to the bottom of the basin.

The same aperture that conveys away the waste-pipe will also admit the pipe which is to supply the water; which last must be forced up by high pressure, and regulated in its ascent by a moveable jet. To accomplish this, a large zinc cistern must be fixed immediately over the aviary, on the outside; and it must be kept constantly filled with spring water.*

To prevent the possibility of any of the birds being accidentally drowned, and to afford them no facilities for acts of "self-destruction," pieces of coral, stone, or crystal rock, should be introduced into the water. On these they will stand in security; and, placing themselves immediately under the descending shower, they will lave themselves in the limpid stream, at least twice every day, retiring from "the bath" in a perfect ecstacy of delight.

The birds having performed their ablutions, which they do in the most perfect order, will now necessarily require to make their toilet; and here let me tell my reader, if he has never yet witnessed this sight, he has a rare treat to come. The "ceremony" observed on such occasions is worthy of royalty itself; but I shall have to dilate on this hereafter, when I speak of the "habits" of the feathered choir.

In furnishing them "Aids for Reflection," I should recommend three looking-glasses, each 3 feet long by 4 inches wide. These should be mounted in narrow frames of flat oak, and nailed to the back of the aviary—just above or nearly level with the long perches. They should be 12 inches apart. The introduction of these glasses will afford a never-ending source of amusement to all parties concerned, and will ensure "respectability of appearance" at least, among all the inhabitants.

The "hoppers," or food troughs, for the seed-birds, are made of mahogany, on the principle of a rack; having a moveable slide of transparent glass in front, and a cover or lid with hinges, lifting up at the top, to receive the seed. All along the front of these "hoppers" is a projecting rail, on which the birds sit while eating, and, underneath, four round holes, through which they put their heads to get their seed. As the latter is being cracked, and eaten, the hull falls to the ground, and a fresh supply descends from above—the apparatus itself being self-supplying.

Four of these "hoppers" should be suspended on the wall, between and on each side of the looking-glasses. They should be regularly emptied and cleaned out twice every month, as a quantity of dust, &c., is apt to collect in them, thereby spoiling the food. If kept half filled only, this will prevent waste. They are procurable, I should add, of almost any London dealer in birds.

The pans for the food of the soft-billed birds must be kept always on the ground. I should advise their being made of glass, or china, and of a square form.

The floor of the room should be cleansed *daily*; and always kept well supplied with small and pebbly gravel (well dried), and old mortar well bruised. *William Kidd, New-road, Hammersmith.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND; OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

No. III.—On Raising and Management of Vines.—If, my friends, you have carefully read, conned, turned over, and digested the contents of the foregoing papers, we will proceed to another branch of our subject. Now, since climate and soil do so much for the cultivator in the countries best suited to the growth of the Vine, we must try and excel them as much in our management.

Culture of the Mind.

As soil and climate are favourable, so does the produce increase. And so does man's wit and energy decrease.

I will first begin with a few general rules.

In pruning always cut upwards, and in a somewhat sloping direction.

Always leave an inch of blank wood above a bud, and let the cut be made on the side opposite the bud.

Sores always smart; and old wounds, if not cut away and smoothed over, are always rankling.

In cutting out an old branch, prune it even with the limb from which it grows, in order that the wound may quickly heal.

A rule extraneous but useful.

Never prune in frosty weather, or when a frost may be expected. Never prune in the months of March, April, or May. Let the general pruning in autumn take place as soon after the beginning of October as the gathering of the fruit will allow. Never prune when in a rage, lest you should cut your finger.

I will here add a scale by which the fruit may be calculated which a Vine ought to bear.

A man who gets into debt may be likened to an over-fruited Vine, or worked-out ground, for he has forestalled the fruit of his labour, and will either cheat his creditors by death, or must retrench to recover his former position. Greediness brings its own punishment.

The quantity of fruit a Vine ought to bear is best calculated by the circumference of the stem. No Vine should bear fruit till its girth near the ground measures three inches, when it may ripen 5 lbs.; and for every half inch increase of size 5 lbs. may be added. Thus, if you raise a Vine from a cutting you must not be impatient or greedy; for every pound's weight of Grapes a Vine is suffered to bear before it attains the size of 3 inches round the stem, 10 lbs. will be lost eventually. Therefore at every autumnal pruning the number of rods and buds (allowing a bunch of Grapes to each bud 1 lb. in weight), should be reckoned in reference to the measurement of the stem. Let one of the lads try his newly acquired skill in figures on this calculation some evening when he has returned from the national school.

On Raising Vines from Cuttings.—Vines are best raised from cuttings. Choose, at the autumnal pruning, shoots of that year, ripe (that is brown and hard), moderate in size, and short-jointed. Cut them off so as to leave a thin slice of old wood at the bottom. Then shorten them to two buds, not reckoning the bottom one. Dig the ground to the depth of 18 inches, make the earth fine, and if the soil be stiff, take two-thirds of it away, and supply its place with light rich mould, or road-scrapings. Make a hole with a stick; put in the cutting about 3 inches deep, and press the soil lightly round it.

A good education when young, and a good start, are better than an increased patrimony.

Cuttings should be put in in a well-sheltered spot, and where not too much sun comes. The soil should be kept moist, for which purpose soap-suds will do as well as any other liquid manure.—*C. A., Nov.* 5.

Fears of disappointment are oft the best stimulus for an enterprising mind.

---

* The plumber who makes the cistern will, or ought to, thoroughly understand how to make the fountain "play."

Home Correspondence.

Fern Cases.—I was much pleased lately with some Fern cases (some being miniature greenhouses, some mere bell-glasses) placed on a landing in a house. Mentioning them, I was requested to ask about their management, and received the following answer. "Do not imagine it a difficult thing to have fine cases of plants. The soil is the first point; get good peat, with plenty of white sand in it, and mix with it about a third part rotten leaf mould; a bottom of the case must be well drained with small stones, &c. Water plentifully when the plants are first planted, but never after till you see by certain signs that it is wanted. The cases vary in price, a zinc worker and glazier might build one very cheap; it should be a small greenhouse, with one door to shut very close—hermetical sealing is quite unnecessary. The usual temperature of a sitting room is quite sufficient, or even of an entrance hall. Do not anticipate difficulties, and if you succeed you will be much pleased." The largest cases which I saw were perhaps 3 feet long, the interior was laid out in the form of a Lilliputian rockery. *Edgar Montagu, Lustleigh, Newton, Devon.*

Heating: Polmaise: Vineries.—I am about to erect a Vinery 16 feet by 30 feet, with a lean-to roof. Will you kindly tell me what angle you consider best for the roof? and, next, what is the best mode of heating? My gardener and I say "Polmaise," and he has had considerable experience elsewhere. I have one small house heated by hot water; another by the old flue; and two pits, 24 feet by 10 feet each, by one Polmaise apparatus; by means of lids we can regulate the bottom and top heat of both, and get any amount required. The floor of the apparatus is 6 feet 3 inches below the floor of the houses. In my new house I think of going deeper. Now, there is an ominous silence about Polmaise, and as though it did not answer; there may be objections that I know nothing of; with me vegetation is very healthy, and the flavour of the fruit—Strawberries, Melons, Tomatoes—remarkably good; we grow the latter as bushes, in pots, and have fruit 12 inches in circumference. Some say they cannot get up the heat with Polmaise; with a small apparatus and little coal, we can get up and maintain stove heat. I wish to know what real objection there is to it before I commit myself further? In the construction of the roof, I think of using no putty, as it becomes loose in a few years; but I shall glaze on rafters 18 inches apart, putting a strip of India-rubber down the edge, then the glass; on this another strip of India-rubber, and screw on a strip of wood above all. Instead of overlapping, the glass will "butt," with a thin strip of India-rubber between the edges. I think of ventilating with sliding sashes, back and front; these will run, not in a groove which holds wet and rubbish, but on a strip, with a groove in the sash. The alternate ones will open, with one action. Now, here I wish to ask your advice: my gardener says we should have alternate sashes on the roof to slide down, for sometimes with a cold northerly wind, though the Vines might require air, he should be afraid to open the back lights. Will you kindly give me your opinion on this point? With the roof to open, may not the perpendicular lights at the back be fixed? *E. G. B.* [If Polmaise succeeds with you, by all means persevere in its use. The slope of the roof is immaterial; 35° is a good angle. No doubt it is very inconvenient to be obliged to open the back lights of a Vinery in cold north winds, if the growth is not almost over.]

Æchmea fulgens.—What is the best mode of treating this plant after it has flowered? Mr. Appleby, in some botanical periodical, recommends cutting down the plant, to encourage the suckers. I observed at Chatsworth very large specimens of this plant with very numerous shoots, and the practice there is not to cut down the old plant that has flowered. One which I cut down has produced but one weak shoot; one which I have left is making two or three shoots, and is altogether in a better condition. I should observe, however, that it originally was a stronger specimen than that which was cut down. *Dodman.*

Introduction of Novelties.—I enclose a few seeds, the produce of some found in the crop of a pigeon shot in North America. The plant is very like the common Scarlet-runner Bean, with a dull flower, but the seed vessel is very ornamental, from its bright red colour when advancing to maturity. Might not many interesting plants be thus introduced by the ornithologists during their shooting excursions? *N. S. H., Bury St. Edmund's.*

Cayenne Pepper.—As no one has answered your correspondent's enquiries respecting the best mode of making cayenne pepper, I send you a short way of reducing the pods to powder. The chilies or capsicums must be quite ripe before using them; let them be laid before the fire an hour or two to dry crisp, so that they will easily break by pinching with the finger and thumb, not so near as to burn them. When dry, pound them in an iron mortar, which had better be warmed by the fire also, to insure perfect dryness. The operator must be careful of his eyes and nose, and also to wash his fingers well after the pepper is made. I use a wooden cover over the mortar, but still there will be a quantity of impalpable dust escape, which is very annoying till one gets used to it. Grinding will not do, as the seeds containing so much oil constantly clog a mill, and the pepper cannot even be made so fine as by pounding. By the above method I can make cayenne pepper as fine as Scotch snuff without sifting. The best way is to make a little at a time, enough to last a month or so, as pepper will not be so high in flavour kept long in powder. Chili pods will keep for years, if hung in thick bags in a dry place. *G. R.*—I have not used any Cayenne pepper in my house for many years, but what I have grown and prepared myself. My method is very simple and easy. I lay the Capsicum upon tin plates, or pans (the shape and size is immaterial), and place them before a fire, or on the hot sides of a grate, or a hot hearth, or in some other way, the most convenient to myself at the time, to dry. When crisp, I break the Capsicums down altogether, and then they grind easily and cleanly. In the process, the pulp is dried up, and it grinds freely with the skin, or rind, and seeds. The only attention required in the process, is to watch and see that the colour of the Capsicum is preserved; for if they are suffered to burn, or even to be scorched, the quality is so far injured, if not destroyed. The kinds of Capsicums I grow for this purpose, are the Bird Peppers of the East Indies, and the Hen Peppers of the West Indies, as the most pungent sorts; for taste and strength are everything to the stomach, whilst colour is everything to the eye. The larger kinds of Capsicums may be considered as more ornamental on the plants when growing; but then the fleshy part should be cut out before drying, as it has no strength, and would only add to the quantity, and lessen the quality, in the same proportion. I inclose a small sample from my supply of the present year; it will afford a specimen of its appearance, if not of its quality, for the aromatic flavour may be deteriorated in its transit through the post, but even that might be partly recovered by a little care and attention. *R. W.* [Very good Pepper; but our correspondents should add a little salt to their preparations. Pepper so treated keeps better and tastes better.]

Cyrtoceras reflexum and multiflorum. — Will any one who may have been successful in the cultivation of these two stove plants oblige me with an account of their treatment; I have frequently seen them in different collections, I but never yet saw them approach anything like perfection. *T. E., Oct* 29.

"*Witch Knots*" *in Forest Trees.*—In one of your late numbers we had a woodcut and description of a curious montrosity in a Geranium, which was soon followed by a dissertation on the subject by my friend Mr. Beaton. Such freaks of Nature are not very rare among Geraniums; but my present business is not with them. Nevertheless, the subject reminded me of another curious freak, the cause of which I should be glad to learn from yourself, or some of your contributors, I allude to the buzle or knot, or whatever it may be called, that sometimes appears in forest trees, and at a distance looks like a nest, or number of nests. It is most common in the Birch and wild Cherry, but chiefly in the former; and I have seen it also in the Elm. The country people, in some districts, call them "Witch Knots." I have noticed a tendency of the kind in dwarf bush trained Morello Cherries, though not to a degree to resemble a magpie's nest, as in the Birch. Query the cause, and how accounted for? *Quercus.*

Potatoes.—The following is an account of the produce of two Potatoes, grown by Mr. Stewart, gardener to the Marquis of Londonderry. They were cut into 24 sets, and planted in the first week in May in a drill 12 yards long, with two barrowfuls of manure. They were soiled up once with a garden hoe, but received no other attention. When taken up on Saturday, the 2d inst., the produce was found to be 15 stones 7 lbs., or 217 lbs., all eatable Potatoes, the greater part of which weighed from 1 lb. to 2 lbs. each, and eight of them 14 lbs. All are free from disease, and otherwise excellent for table use. *Michael Burke, Wynyard-park Gardens, Durham.*

Sowing and Protecting Early Peas.—This being the very best time for putting in the first crop of Peas, I would recommend them to be sown on a southern border, and also on a northern aspect, both at the same time. This insures success either in inclement or mild winters, and sometimes both crops are preserved. In open compartments, let the ground be ridged 1 yard wide; sow both on the southern and northern sides of the ridges. In case of long frost and snow, there are ten chances to one that those on the cold side will be protected, whilst those on the sunny side, deprived of snow, will be destroyed by frost. In mild weather dredge soot between them, in order to ward off slugs, &c. Sink a pot or pitcher, greased with good lard and half filled with water, into the earth up to the brim, as soon as the Peas are sown; this will trap all mice, and a cat's skin, neatly stuffed, will frighten the birds. *J. Hardy, Nov.* 4.

Lymexylon navale.—The important fact published in your Paper relating to the reappearance of this insect, will render any remarks upon the economy of this formidable enemy of our dockyards interesting to many of your readers. This beetle appears to have been for a long time known as an inhabitant of the British isles, it having been recorded in 1802 as a native by Stewart in his "Natural History," and a few years after by Dr. Turton. From that time until the appearance of Mr. Curtis's 8th volume of "British Entomology," no record seems to have been made of its appearance. In that work a good figure is given of the female taken by Mr. J. H. Griesbach, in Windsor Forest, on an old Oak tree, in July 1829. To those who are interested in the adaptation of anatomical structure to special purposes, the mouth of this beetle, as exhibited by Mr. Curtis, in the plate referred to (382), affords an admirable example; the jaws being formed for cutting and boring, in an extraordinary manner. The palpi of the male are branched like coral, and hang like tassels on either side of the mouth; those of the female, however, are very simple. This distinction, no doubt, indicates some difference in their economy, which is, probably, at present unknown. As "J. O. W." has taken no notice of the males, are we to infer that he is ignorant of their peculiar structure, and that all the specimens he obtained were females? From the destructive effects of this insect, every point in its economy ought to be thoroughly investigated; if that of the male differs from the habits of the female, possibly the former may be attached to flowers, and thus a decoy might be discovered for them. An allied insect (*Hylecœtus Dermestoides*), with equally curious feelers, is also figured and described by Mr. Curtis, in Vol. 14, pl. 654; this insect attacks old Birch Trees, and was found in some numbers, in 1836, by Mr. T. Desvignes and others, in Sherwood Forest, flying round an old tree at noon. This beetle, however, inhabits the living trees, while the Lymexylon breeds in fallen or dead Oak. "J. O. W." surmises that Mr. Griesbach's specimen might have flown from Oak timber brought up the river; even then the greater probability would be that it flew from British Oak. I consider, however, that this specimen affords much better ground for establishing the species as indigenous, than the mere description of the larva which subsequently convinced "J. O. W." *Alpha.*

Vine Culture.—There is a point in Vine-growing on which I should like the opinion of some of your correspondents. It is, "How long ought Vines to be kept in a state of excitement after the fruit is cut?" Can they, in any instance, be the better for such treatment? At this place there are three Vineries. The first we commenced to force in January; the last got little or no fire-heat. In the first house there were Pines till within the last fortnight, and the Vines have as yet lost very few of their leaves, scarcely any. In the second house, Grapes ripen in August; there have been Pines all summer, but this house is so far different from the former, that instead of taking out the Pines, we turn out the Vines at the time of wintering; but this has not yet been done this autumn. In the last house there is still a quantity of Grapes, but the Vines are getting into "the sear and yellow leaf," while those in the second house are, comparatively speaking, green; evidently because the house has been kept warm. As the fruit is now all cut, is it better to turn out the Vines at once, protecting them in frosty weather, or to leave them until the leaves are ready to drop? My own opinion is, that after the fruit is thoroughly ripe and cut, the sooner Vines are exposed the better, or then, I apprehend, their time for rest is considerably shortened. *Inquirer, Nov* 2.

Rivers' Double-bearing Raspberry.—Having received, two years since, a dozen of Mr. Rivers' new late-bearing Raspberry; this year they have produced an abundant crop of very large and fine fruit, and if this weather continues, I should think the fruit will continue till nearly the end of this month; it is far more prolific than the old double-bearing Raspberry, and the fruit is finer. *Dodman.*

Creepers.—I have lately been presented with some West Indian seeds by a person who was not a botanist; several of them I have raised, and some are now in flower, and amongst others "Clitoria ternatea" (called Blue Creeper). The flowers, both of the blue and white varieties, are quite as fine as those represented as "Clitoria ternatea major" in Paxton's Magazine of Botany, where they are stated to be natives of New Holland, which I cannot but think is a mistake. [It is found in all warm countries.] Ipomœa mutabilis (presented as Blue Convolvulus), I have now in most beautiful blossom; and why it is not more cultivated, I cannot imagine, for it is one of the finest creepers in existence, with pale ultramarine flowers of 3½ inches in diameter. Seven or eight of these open each day, and, contrasted with Ipomœa Horsfalliæ, and I. ficifolia, make a charming sight. Can you tell me what the botanical name of a Cucurbitaceous plant, with yellow flowers, palmate serrated foliage, and very rough fruit, as yet in an unripe state, and about 5 or 6 inches long, is? [Momordica Balsamina.] The seed was given to me as the "Monkey Creeper." I have also the "Crab's-eye Creeper," the "Puppy-eye Creeper," and many others, which, perhaps, you may know by their local names, as well as their botanical. [No.] Some seeds were given with the names "purple cephalics," "white cephalics," "striped cephalics," "yellow cephalic." I presume there are species of Cephaelis. And if you can give me any information as to the true names of those I have mentioned, I should be much obliged. *T. D. H., Hythe, Nov.* 13. [We are unable to furnish the information required.]

Wintering Half Hardy Plants.—I tried the following method last winter, and found it most successful. Having many good plants of Fuchsias, Pelargoniums, Cupheas, &c., which I did not like to lose, and having no proper place to winter them in, I dug a hole under a south wall,* and placed in it a common Cucumber frame, banking up turf† outside to within 2 or 3 inches of the top, and about a foot thick at the bottom, shelving up to nothing above; this kept the plants perfectly during the last severe winter without even a single mat being put on once; and amongst the subjects thus preserved were many scarlet Geraniums put there purposely to try whether they would stand the severity of the winter in this situation as well as those in a house. I found no difference, and I think I may say with truth that I did not lose one. I must state, however, that I kept the lights lifted on all favourable opportunities; the pots rested on bricks, and to this, together with the admittance of fresh air, and keeping the plants almost without water, I attribute the great success that attended my efforts. *E. X., near Braintree, Essex.*

The Smoke Plant.—One of your subscribers asks what is "the Smoke plant?" and he sends you a specimen of it, but so bruised up that you could not recognise it; probably it was a piece of Fumitory, *Fume à Terre* (French), or (Latin) *Fumus Terræ*, the Smoke of the Earth (English). Your correspondent is probably a good observer, and has found that when a sod of Fumaria officinalis is drawn out of the ground, the stalks near the roots have a strong smoky smell, and yield "the smoke" to the name. The branch sent to you being very much crushed adds to the probability that this is the plant, as the Fumitories are exceedingly succulent and easily bruised. The rapidity with which this plant springs up in newly dug rich soil has been thought to be the origin of its name, but the *haut-gout* of the roots and the root-branches is so strong and remarkable as to leave no doubt why the name is given. The experiment of smelling them may be tried, as "Fumitory rank" is a well known and plentiful weed ever since Shakspeare's time. *Richard, Rath Lee, Cork.* [What we received was not a Fumitory.]

The Smoke Plant: Open Fire-places. — In reply to your inquiry, at page 696, I beg to state that the Smoke Plant does emit what looks like smoke on pressure; and this is its chief curiosity. The flowers are very minute, and had, perhaps, fallen off; the plant is not a creeper, but very upright. The lady, who had it sent her from abroad, keeps it in a window, which, probably, makes it sickly. For a window-gardener she is most assiduous and intelligent, and her idea that it might be worth something, as a curiosity, inclined me to make the inquiry, as that would be most important to her. And as I am on a charitable subject (and I rejoice to see your kindness in these respects), could you suggest the best economical fire-place, or open stove for a sitting-room in the institution of which I send a report. The room being united to the rest of the house by a passage, and the rooms in that house being chiefly appropriated to constant invalids, the number of fires needs much supply of air, and we suppose that is the reason the high chimney of this room has been very apt to smoke; the air coming down for the supply. We have accordingly been of late obliged to have a stove; but this is neither so comfortable nor so healthy for invalids as an open fire-place; and needing a new one, and our funds being very low, we are most anxious not to spend money needlessly. We have a very tolerable sized garden attached to this institution for the sake of the sufferers' exercise, in which we are indebted to many of your suggestions for improvement. During the Potato famine we grew quantities of Jerusalem Artichokes; but they are not now much liked there—for what should we sell them in exchange for Potatoes? *A Subscriber.* [The most economical and very best open grates we have seen are an admirable kind manufactured by Mr. Pierce, of Jermyn-street, to whom we advise you to apply. We use them ourselves, and find them faultless.]

Green Ginger.—I am surprised in these times of luxury that this is not grown for the market, seeing that it is one of the principal ingredients of a good currie. I believe it is easily grown in the tan of a Pine stove. Hadjee Allee, (61, Boston-place), who is the celebrated compounder of Indian dishes, lamented, when serving a dinner consisting of a variety of curries given by Colonel Ludlow at the Oriental Club, that he could not do his employer justice or himself credit for want of green Ginger, and green Cocoa nuts. Now the first might be easily and cheaply grown for the London market, one should suppose to the delight of the lovers of currie; the green Cocoa nuts, I suppose, are unattainable, unless indeed the West India mail steamers brought them in addition to the cargoes of Pines. *Dodman.*

Manure for Potatoes.—I see in your Paper (quoted from the *Economist* of October 19), a method of preparing manure for Potatoes, according to which the dung (stable-dung and vegetable compost) was mixed with one-fourth or one-fifth of quick lime. Is not that an excellent way of getting rid of the ammonia, equal to the bleaching system, by exposing it to sun, wind, and rain? *Timothy Clod, Forfarshire.* [Yes. But as ammonia is undoubtedly injurious to the Potato crop the object of the writer is, we presume, to do exactly what you describe.]

Æschynanthus pulcher.—We have a plant here in our stove of this Æschynanthus, growing in a 10-inch pot, and covering a cylindrical wire trellis 3 feet high and 5 feet in circumference, with no less than 460 expanded flowers on it. This is the second time it has favoured us with its beautiful and curious flowers this year, proving it to be not only a first-rate plant for competition, but excellent for the winter garden. *J. M'Pherson, Reswallie, Forfarshire, Nov.* 8.

Conveyance of Water.—Would any of your readers kindly give the result of their experience, as to the best method of bringing water from a spring, one mile distant, with a good fall? Would gutta percha tubing last underground? The water is required for the use of a village containing 500 inhabitants. *Country Curate, Brandon, Nov.* 14.

* It is contrary to the general way, the north side being considered best, but I have found that when the plants in a pit, having a north aspect, once get damp (and they will do so in foggy weather, do what you will) it is almost impossible to get them dry, and then they invariably rot off.

† It is best to put a brick or tile up edgeways against the frame, as this preserves the wood.

Review.

The Sugar Planter's Manual, being a Treatise on the Art of obtaining Sugar from the Sugar-cane. By W. J. Evans, M.D., 8vo, pp. 244. London, 1847.

The Practical Sugar Planter; a complete Account of the Cultivation and Manufacture of the Sugar Cane. By Leonard Wray. 8vo, pp. 415. London, 1848.

The Manufacture of Sugar in the Colonies and at Home, chemically considered. By John Scoffern, M.B., 8vo, pp. 160. London, 1849.

Copies of Report and Correspondence on the subject of Dr. John Scoffern's Patent for Refining Sugar, presented to Parliament, 14th August, 1850. Folio, pp. 18.

There is no part of the manufacture of sugar which stands more in need of chemical aid than the purification of the cane-juice, and the separation of the azotised impurities; it will be interesting to go a little further yet into the details of this part of the subject, as we shall then be better able to show the exact position of the manufacture at the present time, pointing out the difficulties which surround the sugar-boiler, and the remedies which have been proposed to aid him.

Unfortunately the juice of the Sugar-cane does not merely contain one form of azotised matter, which may be precipitated and thrown down in the insoluble form by some simple process, but, on the contrary, it contains at least three; and, besides, these substances are, as is well known, very liable to undergo change and modification, their properties being altered either by spontaneous decomposition or by the action of a variety

of other substances. In its fresh state, cane-juice appears to contain albumen, gluten, and caseine, or some similar substance. The first of these is readily separated from the juice by mere exposure to heat, which coagulates it, and causes it to separate in the solid form as a scum. The gluten appears to be chiefly held in solution by acid matter, and is consequently thrown down by the addition of lime or some other base; but the third azotised matter is not precipitated by either of these means; it remains in the purified cane-juice, and interferes greatly with its evaporation and the manufacture of the sugar. Sugar-boilers are well aware that there are two distinct substances to be separated in the clarifiers, and, indeed, they not unfrequently effect it by two distinct operations; first of all, heating the juice, to cause the coagulation of the albumen, and then adding lime to precipitate the gluten.

There are many practical difficulties which interfere with the use of lime, and which renders its action far from complete and perfect. The desired effect will not be produced unless rather more lime is added than is necessary to combine with the acid matter present in the juice; and, at the same time, an excess of lime is hurtful. Free acid matter causes the subsequent destruction of some of the sugar, and tends to keep a portion of gluten in solution; whilst free lime likewise causes the destruction of sugar, gives the syrup a dark colour, and cannot be easily separated when once in the syrup. Lime does not act thoroughly in purifying cane-juice, unless the mixture is heated up to the boiling point, this perhaps in part depends on the expulsion of ammonia set free by the lime; but the juice must not be permitted actually to boil, because, if it does, the scum of azotised matters precipitated by the action of the lime will be broken up and diffused throughout the liquid again, and could then only be separated with great difficulty, and by very complete filtration. This precipitation of the gluten may be effected by either potash or soda quite as completely as by lime, but the latter is preferred, because the compounds which it forms with most vegetable acids are nearly insoluble, and because the presence of soluble alkaline salts in the clarified juice would greatly interfere with its subsequent concentration; they would tend to diminish the yield of crystalline sugar, and to increase the proportion of molasses. We must confess that the chemical explanations offered by the various authors who have written on the manufacture of sugar, as to the use of lime, and the precise mode in which it acts, are far from satisfactory; after all that has been done, there yet remains a great deal to be explained, and a great deal to be investigated, the explanation of which would probably lead to important improvements in the manufacture.

When the right quantity of lime has been added, and the separation of the scum has been carefully performed, the clarified juice is then transferred to the evaporating vessels. There are generally five of them, through all of which the juice successively passes, entering the first as it comes from the clarifiers, and leaving the fifth as a concentrated syrup. During the whole of this process, the juice is constantly skimmed, to remove the impurities which continue to precipitate and separate in the form of scum. If the object of the manufacturer is to obtain common Muscovado sugar, he carries on the concentration of the syrup until he judges that it is in a state to crystallise, when it is transferred to the coolers, in which it is cooled rapidly, and allowed to crystallise, being stirred about from time to time to aid its granulation. When the syrup is completely cooled, it is found that a portion of the crystallisable sugar has separated in the solid form, whilst the remainder, together with the uncrystallisable sugar, or that which has been injured, with a considerable quantity of impurity, is left in the fluid state; the whole is then allowed to drain, so that the fluid part may run off, constituting the molasses, after which the raw sugar is fit for exportation.

In the crystallisation of the sugar from the syrup the same want of attention to the physical conditions which ought to regulate the process may be observed, as is evident in many other parts of the process. When syrup is cooled very slowly, the sugar crystallises in large and regular crystals; but a great portion of uncrystallisable sugar is enclosed in the cavities which are formed between the crystals. It is found that if the mass of hot syrup is large, and it is left perfectly quiet, so that it may cool very slowly, the resulting sugar is not obtained in a convenient commercial form, or one suitable for the further operation of the refiner; hence it is always the custom to agitate the syrup, so as to disturb the crystallisation, and obtain a small granular crystallisation; when this is properly done the crystallisable sugar separates in regular grains, and it is comparatively easy subsequently to drain off the molasses from it. The sugar makers, however, are not content with agitating the syrup, but also, with the view of saving time, they cool the syrup in large flat cisterns or coolers, so arranged as to be exposed to the cooling influence of a current of fresh air playing over the surface of the syrup, and rapidly chilling it. By so doing it is very probable that they save time, but it is certainly done at the sacrifice of the sugar, which is thus obtained in such a condition that the molasses can only be separated from it with great difficulty. Dr. Evans thus describes this part of the process: "When the mass of sugar and molasses has become sufficiently cooled, it is dug out of the cooler, shovelled into a bucket or some other vessel, carried into the curing house, and there thrown into the hogshead as if it were so much manure, where it remains until the drainage of the molasses is sufficiently complete to admit of its shipment." He remarks respecting the cooling of the syrup: "Had the planter intended to convert the cane-juice into dough or bird-lime, he could scarcely have invented a more successful method of accomplishing his purpose; but, to obtain sugar, a more ill-judged method, or one more defective in principle, could not be employed."

Those vegetable principles which the plant secretes, and which are present in the cane-juice together with the sugar, as it runs from the mill, are but very imperfectly separated from it in all these operations; and the difficulties attending the latter part of the process, and which extend to the labours of the sugar refiner, are in great measure to be traced to the imperfect manner in which the first part of the operation is effected. Even when the separation of the scum in the clarifier has been very complete, and just the right proportion of lime has been added, there yet remains a considerable quantity of azotised matter analogous to caseine, which gradually and partially separates from the syrup during its subsequent concentration in the five evaporating-pans. A great deal of injury is caused to the sugar during the evaporation of the syrup, from the two-fold influence of the impurities which it contains and the high temperature to which it is exposed; this leads to the formation of a large quantity of uncrystallisable sugar, and to the discolouration of the syrup, which gradually darkens in colour as it becomes stronger and richer in saccharine matter. Two very important improvements in the manufacture of sugar took place when the vacuum-pan and the use of animal charcoal were introduced. By the use of the former the manufacturer is enabled to evaporate the syrup at a temperature much below that which would be required in an open evaporator; and thus the evil effects of exposing the syrup to a high temperature are greatly diminished. By the use of animal charcoal as a filtering material, the dark colour of the concentrated syrup is removed, and at the same time that it does this it likewise removes the greater part of the impurities, whether azotised or saline, which remain in the juice; the introduction of this powerful purifying agent is perhaps the greatest step which has yet been made.

The chief desideratum at the present time appears to be an improved mode of removing the azotised matters from the juice, easily applied, rapid in action, and more perfect than the mode now employed. The other difficulties may, for the most part, be met and overcome by the means already at the disposal or within the reach of the sugar boiler; but he has no perfect method of removing at once the whole of the azotised matter which the juice contains. From time to time various schemes have been proposed, but however plausible and complete when tried upon a small scale, they have generally failed when tested in the manufactory, or have been soon abandoned from some practical difficulty as great as that they were originally proposed to remedy. Amongst the substances recommended were oxide of zinc, alum, sulphate of alumina, and sub-acetate of lead; these, and a variety of other substances, were proposed as finings or precipitating agents in the purification of cane-juice, and also in clarifying syrup, as effected by the sugar refiner, the two operations being, in fact, nearly identical. It would be foreign to our object to go into the consideration of these and many similar schemes; we shall merely advert to the use of lead as a purifier, especially in the mode patented and advocated by Dr. Scoffern.

The azotised matters present in the sap or juices of plants, may be very perfectly precipitated by solutions of certain metallic salts, such as corrosive sublimate, and sub-acetate of lead; this fact has been long known, and no doubt would have been practically used, had it not been for the highly poisonous nature of such salts, and the extreme difficulty, not to say impossibility, of completely removing all trace of them from the juice they were employed to clarify, and the consequent chance of rendering the sugar produced poisonous, or, at least, unwholesome. Some years since, in 1839, a patent was taken out by Messrs. Gwynne, for the purification of cane-juice, and refining of syrup, by the use of a solution of sub-acetate of lead; and it was proposed to add a portion of biphosphate of lime to the clarified liquid, for the purpose of separating any lead which might remain in solution, and which, when thus precipitated in an insoluble form, might be removed from the liquid by a second filtration. The practical difficulties appear, however, to have been considerable, and even with the greatest care, the chance of the sugar containing lead was very great.

In Dr. Scoffern's patent, a new mode of precipitating the excess of lead is proposed, the process being based on the fact that a solution of lead may be perfectly precipitated by the action of sulphurous acid gas; and it is stated, that even if a portion of the salt of lead thus formed, should by any chance remain in the sugar, it would be in the state of an insoluble, and therefore perfectly harmless compound. There is no doubt whatever that the impurities in the cane-juice or syrup may be readily and most perfectly precipitated, by the addition of a small quantity of the sub-acetate of lead; and it consequently follows, that if by the use of sulphurous acid gas, the presence of lead in the sugar, or, at least, its presence in a hurtful form, can be guarded against with certainty, the new process must be a very great improvement upon all previous methods. Doubts, however, have been raised respecting the safeness of the process in a sanitary point of view; a great deal of correspondence has taken place on the subject, and the Government, in vindication of the steps which have been taken to caution manufacturers against using the process without good evidence of the prudence of so doing, have published the reports of six scientific men to whom they referred the subject for consideration. The quantity of acetate of lead employed is so small that we may altogether pass over the question, what effect is produced by the acetic acid thus introduced into the syrup, though it is obvious that it must do some harm; the only question of real practical importance is, whether the excess of lead can be separated in so effectual a manner by the patent method, that the process can be used with safety to the public.

The report of the three chemists appointed by Government is a very curious document, and contains several important facts. Previous to examining samples of the patent sugar, they took the precaution of analysing good specimens of the ordinary muscovado sugars of commerce; they found in these minute traces of lead, and also copper. The quantity it is true was very small; but there is no reason that any metallic poison should be suffered to enter into the sugar. They were both no doubt derived from the vessels employed in the manufacture; the use of white-lead, which is very commonly employed to paint the interior surfaces of the metal and other vessels used, is highly objectionable. After examining a number of samples of sugar prepared by Dr. Scoffern's process, the Government reporters state, "It appears from the foregoing details, that the refined sugar, bastards, and treacle, generally acquire a trace of lead from the new process, sufficient to be distinguished by chemical tests. The lead appears to accumulate in the treacle, but in no case that we have had an opportunity of observing, to such an amount as would justify us in pronouncing the treacle poisonous," &c.

This report was then referred to three competent authorities in medical jurisprudence, for their opinion, and they state that the constant use of sugar containing a small quantity of lead; such as they assume from the chemical report sugar thus prepared may contain, "would be likely to prove highly injurious to health; and in the course of a few months might give rise to alarming syptoms of poisoning." It certainly would seem from the evidence of the different persons, both in this country and also in the colonies, who have been employed to examine the products of the patent process, that they do contain decidedly more lead than those made by the old mode. This, however, taken alone, is not to be considered as a condemnation of the patent, because it is stated that if any lead does accidentally escape the filter, and so pass into the sugar or treacle, it will not be in a poisonous form, but as a harmless insoluble sulphite; indeed Dr. Scoffern goes so far as to assert that it is no more injurious than so much chalk. This is in fact purely a medical question, but as far as the chemical evidence goes, it certainly does not bear out the statement that sulphite of lead is "insoluble, and therefore harmless." No doubt it is insoluble in pure water, but on the other hand it is soluble in, and readily acted on by a number of saline solutions; hence it is not reasonable to expect that it should pass through the stomach of an animal without being decomposed, and the lead being brought into a soluble, and consequently active state. The process is highly ingenious, but we greatly fear that the results of the manufacture would be very liable to contain a portion of lead; and we very much question whether the sulphite of lead is a substance which may be taken into the human stomach, day after day, even in minute quantities, with impunity.

Miscellaneous.

Tulip Exhibition for 1851.—The following address to the Tulip growers in the kingdom has been published by E. S. Dodwell, Esq., of Derby:—"Gentlemen,—I beg to address you, and to invite you to a conference on the subject of the Great Tulip Exhibition for 1851, delegated by you, at your late meeting in Manchester, to the society I represent. In regular course, after receipt of your delegation at the hands of your late secretary, Mr. Dixon, I laid the same before the committee of the Horticultural Society here; and I am gratified to state that it was received with warm cordiality, and a motion pledging the committee to give it all possible support, and a gratuitous accommodation in the large hall in which the exhibitions of the society are held, with a donation of 5*l.* to the fund, was unanimously adopted. J. Edwards, Esq., has directed me to place his name on the subscription list for 10*l.*; T. Adams, Esq, 5*l.*; Mr. C. Turner, of the Royal Nursery, Slough, 5*l.*; and my own donation, 5*l.*, completes 30*l.* I mention this merely to claim your attention to what follows. I propose, therefore, as a simple means to this end, the formation of a committee in every city and town, village and floral district, throughout the kingdom. Such committee to communicate with the central committee, to canvass for subscribers, to report the probable number of exhibitors, and generally to suggest such arrangements as may seem most conducive to the success of the exhibition and let but such committees accept their mission heartily and cheerfully, and your work is perfected. Think of the aggregate sum when every lover of flowers in the length and breadth of the kingdom has contributed his (or her, for we love the ladies, and invoke their aid) 5*s.*, 2*s.* 6*d.*, 1*s.* to the fund; and, gentlemen, let me entreat your special attention to the last named sum; think of what is due to humble devotees, think of the pleasure

received and conferred. In days gone past it has been a theme and a glory to remark, 'I took a part in that great battle; I stood to the guns on that bloody day.' Such themes, we hope, are past; but shall not florists, and poor florists, have their theme? Shall they not be permitted to boast, 'I lent my aid to that great work; I helped to achieve that great success?' Surely they may, and surely you, gentlemen of the respective committees, will give them an opportunity so to participate. Remember the work that engages you; remember the result to be produced, the large sum—the aggregation of small sums—the flowers to be brought forward, certain to be the best, and indicating the progress of the Tulip; remember the great meeting, the commingling of ideas, the action of mind upon mind, the radiation of knowledge, the interest and regard created by reciprocal kind offices, the removal of vague ideas and their concomitant distrust; and above all, and beyond all, the sympathetic action acknowledged by the whole community, in the fact each individual enunciates, 'I took part in that great work!' Gentlemen, addressing enthusiasts and devotees, men susceptible of the delights of floriculture, and endued with thought, and energy, and purpose, I cannot doubt your response; and I entreat of you, therefore (my personal ignorance compelling this request), that you will, with the least possible delay, communicate to me your proceedings."—*Daily News.*

Botanic Garden, Sydney.—We learn from the *Sydney Herald* that this garden is advancing rapidly in importance under the skilful management of Mr. Charles Moore. Mr. William M'Leay and Dr. Shanks, deputed to inspect the arrangement of a collection of plants, according to their natural families, have reported to the committee that they were much gratified on their visit by the progress made by Mr. Moore towards his object, and by the neatness and efficiency which were apparent in every department of the garden which they inspected. Among matters of local interest we remark with satisfaction that general colonial interests are not neglected. Too many such gardens become mere appendages to the convenience of a governor, and are of no more public value than his excellency's coach. Under Mr. Moore's superintendence, a considerable number of Vine cuttings received from Germany have taken root, and are intended for distribution. In order to encourage the growth of plants which are valuable for commercial purposes, he has made several distributions of Olive cuttings and plants, and noble trees of some of the best variety of the genus enable him to supply a large quantity of cuttings without injury to the standard plants. In proof of the success which may reasonably be expected to attend the general cultivation of the Olive, he remarks that it is the opinion of highly competent judges that the last year's crop of fruit in this garden was equal both in size and quality to anything they had observed in the south of Europe. Frequent applications are made for Cotton-seed, Sugar-cane, and exotic fruit trees, especially from persons residing in the Moreton Bay district, and as each application has been attended to, there is every probability that the growth of these plants will soon become very general in the northern parts of this colony. Mr. Moore complains, however, of the scarcity of fresh water on the establishment, the supply in dry seasons being limited to a few casks per diem from the Hyde-park fountain, and causing the loss of some rare and beautiful plants. We trust that the Legislative Council will see the necessity of devising some means by which a direct channel for the conveyance of water to the garden may be effected.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Particular attention should be paid to securing as much light as possible in all structures containing plants; and where the rafters or roofs are used as trellises for climbers, these should be reduced within convenient bounds, as the growth of nearly all is or ought to be completed, and as the temperature of the houses are now reduced to suit the comparatively dormant state of the plants at this season. In the conservatory those late autumn flowering creepers which were formerly left unpruned, such as Mandevillas and Ipomœas, are now sufficiently ripened for the purpose, but little more should be done after removing the changed leaves than to prune the weakest shoots; their final pruning should be deferred till March or April. If larger and stronger shoots are cut now, they are apt to commence growing, in spite of the moderate temperature, and thus expend the strength which ought to be reserved till spring. The shoots of Maurandyas should be considerably reduced in bulk, as they are affected by the slightest damp during winter. If any of the late growing Passionflowers or other creepers impede the ingress of light, they should on this account be reduced; deferring, however, their final pruning until they are about to commence their new growth in spring. Forcing Plants.—The free admission of light and air is indispensable to these, and especially the latter, in order that the plants may be kept moderately hardy, and thereby better enabled to bear moving about during cold weather.

FORCING DEPARTMENT.

Seakale.—The best of all places for forcing this vegetable is in the Mushroom-house, as the temperature of that is just sufficient, and the very important condition—absence of light, is secured without additional trouble. Where any regard is paid to neatness, convenience, and economy of labour, let the old-fashioned way of forcing Seakale by means of pots and fermented stable litter be abandoned. The pots are expensive, and very liable to be broken; the litter, if not wanted for the linings of dung frames, will make a much better manure by being rotted without fermentation—therefore to use it in that way involves a considerable waste. Again, it is inconvenient to gather the produce, and to see an exposed heap of fermented litter in any part of a gentleman's garden is inconsistent with that perfect neatness included in the high order of management which ought to pervade all such establishments. Where there is not a spare pit with the bottom heat supplied by hot water, the most economical method is to make up a small bed of Oak leaves, strong enough to ensure a bottom heat of about 50°, but not exceeding 55°; a light frame, about 30 inches high, should be placed upon the foundation, and filled with 18 inches of soil, such as is procurable from an old Melon bed. The plants should be taken up with great care, preserving as much as possible of the thick fleshy root, as upon the stored up nutriment concentrated in it the success of the artificial crop very materially depends. The plants should then be watered sufficiently to settle the soil about them, and the frame covered with shutters and mats, to exclude the light. The Seakale forced in this manner is decidedly superior to that produced by the ordinary method, being firmer in texture and shorter in its growth; it is also a much easier matter either to examine its progress or to gather it for use. By planting the roots 4 inches apart, a superficial yard will produce six or eight dishes; and if the roots are preserved after removal, and laid in till spring, by picking off all the buds but one, they make good sets for another season.

FLOWER GARDEN AND SHRUBBERIES.

Amongst the numerous exotic plants used for summer and autumn decoration, there are many which will survive the winter with very slight protection. All such should now be carefully guarded, as they will materially diminish the quantity of plants to be provided for planting out next spring; and for this excellent reason, in making a selection of plants for flower garden purposes, preference should be given to the kinds above referred to. Under this head will fall Gladiolus, Sparaxis, and many other Cape of Good Hope bulbs; with a great variety of deciduous and half deciduous herbaceous plants, such as Antirrhinums, Pentstemons, Salvia patens, Stachys, Lobelia propinqua and others; and also some shrubby and sub-shrubby plants, as Fuchsias, Hydrangeas, and the more tender varieties of tea-scented and other Roses. The material we usually employ for this purpose is decayed tan, or half decomposed leaves, laid over the surface of the soil as a mulching two or three inches thick. Whatever be used for this purpose, it should be such as is least liable to absorb and retain moisture. Many use sawdust or dry leaves for this purpose, and conceal their unsightly appearance by covering with a little soil, but old tan is more convenient, equally serviceable, and forms a very congenial top-dressing in spring. Other plants of a shrubby or sub-shrubby character (as Roses, and the more tender varieties of Pentstemon and Antirrhinum), in addition to a slight mulching for the preservation of the root, require some sort of a shelter to preserve their branches; the neatest material for this purpose is the prunings of evergreens, stuck into the ground round about them, as at a short distance they are not distinguishable from the plants themselves.

KITCHEN GARDEN.

Peas and Beans.—Those who reside in favourable localities, should now make a sowing of these vegetables, with the hopes of obtaining a very early crop. The seeds should be sown on the leeward side of low ridges, the crowns of which will protect the young plants from cold winds, and the hollows between will aid in keeping the soil dry. Some chopped Furze, or other similar material, should be sown along with the seed, to prevent the depredations of mice. A dwarf variety of Pea, such as Bishop's Longpod, will be found very suitable for the purpose; and of Beans, the Dwarf Fan will be found hardy and prolific. There is a chance, in warm dry localities, that these early sowings will produce good crops, a prospect which is sufficient warrant for the expenditure in seed and labour; but in medium or late situations, the chance of success is very small. In the latter case, there is less trouble, and more certainty, by sowing in boxes or turves early in spring, and planting them out with a slight shelter towards the end of March. Cauliflowers should be examined every three or four days, and those which have arrived at maturity, if not required for immediate use, should be lifted when dry, and after tying their leaves together, should be laid in by the heels in a sheltered situation, or hung up in an airy shed, where they will be protected from wet and frost.

State of the Weather near London, for the week ending Nov. 14, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 21st, 1833—therm. 59 deg.; and the lowest on the 18th, 1847—therm 19 deg.

Notices to Correspondents.

To our Correspondents.—May we beg to be understood that *we cannot answrer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

Araucaria imbricata: *Sub.* It is not particular in regard to soil; sandy peat and loam will suit it perfectly.‡

Back Numbers: Full price will be given for Nos. 49 and 50 for 1848.

Books: *F T R.* "Lindley's Guide to the Orchard and Kitchen Garden" will furnish the information you seek for; or the articles published at pp. 116 and 451 of our volume for 1847 may possibly answer your purpose.‡—*A B.* The "Manse Garden."—*Tudor.* Consult "James's Gardening," in which you will find plenty of such patterns.

Choke Damp: *Fitzwalton.* The subject is, we fear, too foreign to our pages. We will consider whether it will be prudent to open a door to matters not relating to the immediate purpose of the *Gardeners' Chronicle.*

Fruit Trees: *A T K.* In order to have Peach and Nectarine trees, dwarfs or those with tall stems, to bear as soon as possible, you must endeavour to procure some that have been three years trained; but where immediate bearing is not a principal consideration, one year trained trees are preferable. The Breda and Brussels Apricots will bear on a west aspect; and thus you can give a south for the Moorpark. We never recommend dealers.‖

Heating: *A Clergyman.* Polmaise answers perfectly well where it is properly applied to circumstances suitable to it. So much has been said upon the subject that we cannot re-open it, but must refer you to previous volumes, and to the Journal of the Horticultural Society, Vol. II., p. 49, where Mr. Meek gives his own account of it. One of the most common causes of failure is the not allowing a sufficient amount of heating surface. Polmaise heating is like an Arnott's stove: in careful hands, and, when well constructed, it succeeds; in careless hands, or if ill constructed, it fails. Hence the differences of opinion about it.—*A Cockney.* Flues properly constructed are amply sufficient for all ordinary purposes; of course you may blow them up; careless or stupid people may do anything except setting the Thames on fire. All that you have to take care of is, that, in building your flues, the ends can be got at *from the outside of the house,* so as to obviate all difficulty in sweeping them when foul; which should be done every year, after fires are discontinued. Why run it in two lines, one over the other? The best way is to run it in one line on a rise all round the house.

Justicia: *Sub* It is a stove plant, and will do no good with you in a greenhouse ‡

Lawns: *J Jones.* As soon as February is well advanced, lay down your lawn with the following seeds per acre: 1 lb. of Avena flavescens; 6 lbs. of Crested Dog's-tail; 3 or 4 lbs. of Hard Fescue; 20 lbs. of Rye-grass; 6 lbs. of white Clover; and 2 or 3 lbs. of Poa trivialis. If you find this too expensive, reduce the quantity of Avena, Dog's-tail, and Rye-grass; less of all will do if you are in no hurry. This kind of lawn is for regular mowing. Above all things take care that the land is clean, the seeds pure, and the surface perfectly level. ‡

Manures: For most gardening purposes nothing has yet been found equal to good farm-yard manure. But not having a sufficiency of this, you may use guano, at the rate of 5 cwt. per acre, digging it in lightly, taking care to water abundantly afterwards, if very heavy rains do not render that unnecessary. ‖

Names of Fruits: *G G H.* Beurré Bosc. ‖—*F C.* See our Number for Oct. 26, p. 680. ‖

Names of Plants: *O F P.* 1 is the *male* Juniperus excelsa; as to No. 2, as far as can be judged from so very small a specimen, it seems to be J. alpina. J. chinensis is quite distinct from these.—*W and C.* The common Hornbeam.—*X W.* Maxillaria concava has pale, whole-coloured, greenish flowers; M. rhombea has yellow flowers marked with brown; the former has a racemose inflorescence, the latter a one-flowered inflorescence.—*A Sub.* 1, Aster Novæ Angliæ; 2, A. ericoides; 3, A. diffusus.—*A B, Northfleet.* 1, Oncidium unguiculatum; 2, O. ciliatum.—*J N.* Zygopetalum intermedium.

Pears: *Cavanensis.* You will never find the Black Achan worth growing in the South, especially in warm dry seasons. It may prove better than many of the finer kinds in cold wet situations; but you should graft the tree with something better, say Knight's Monarch. Neill is apt to overbear itself. In pruning you must thin and shorten, so as to get a sprinkling of young shoots. Give some manure and water when necessary. The fruit will then come large and not mealy. ‖

Potato Flour: *Ravenswood.* You will find directions for making it in our volume for 1845, pp. 639 and 735.‡

Tobacco Paper: *R S.* We would willingly oblige you, but it is a rule with us never to recommend dealers, and we particularly object to the material itself, which is low-priced and dear.‡

Vines: *P J.* See a Leading Article in to-day's Paper.

Violets: *A Cottager.* These, like Strawberries, are the stronger for having their runners stopped. All varieties are benefited by the operation, provided the old plants are kept in health; but as they do not live long, a supply of runners should always be provided, in order to replace the old plants when their vigour is gone.

Wintering Half-hardy Plants: *Ravenswood.* The finer kinds of Fuchsias, such as Dr. Jephson, Coralina, Giantess, &c., may be safely wintered in a dry cellar which is free from frost. Directions on this subject will be found in "Villa and Suburban Gardening" in another column, and also in an article among our Home Correspondence of to-day.‡

SEEDLING FLOWERS.

Petunias: *J W.* A medium-sized rosy lilac flower, with a yellow eye, closely streaked with dark brown; a nice variety. *

Verbenas: *J G.* Too small in all respects; but this may fairly be attributed to the lateness of the season. It appears to be worthy of another trial.*

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	...£11 0 0
Turnip Manure, do.	... 7 0 0
Superphosphate of Lime	... 7 0 0
Sulphuric Acid and Coprolites ...	... 5 0 0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.
This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament.
Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.
Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

The Agricultural Gazette.

SATURDAY, NOVEMBER 16, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Nov. 21—Agricultural Imp. Society of Ireland.
THURSDAY, — 28—Agricultural Imp. Society of Ireland.

THE letter of "A Practical Farmer," upon the ALLOTMENT SYSTEM, at page 668, deserves a completer answer than it has yet received. His main proposition is, that the possession of a rood of land, a cow, and pigs, will not tend to the comfort and respectability of the agricultural labourer! And this he attempts to prove by asserting that it is incompatible with the due performance of a fair day's work for an employer; that there are certain objections to labourers keeping pigs well known to farmers, which need not be more fully specified; and that the affair is "quite an Irish system," introduced by well-meaning but inexperienced men.

Now, we believe the whole of this argument to be inconclusive; partly because its data are not facts, and partly because its logic is unsound.—The proposition itself is a very proper subject for discussion; and, as put by our correspondent, it implies an admission by him that the condition of the labourer, for itself and quite apart from his relationship to any other class in society, is a matter of very great importance—an assertion which, surely, no one will deny, whatever the inferences which may be fairly deduced from it. Now, consistently with this opinion, we are glad to know that there is many an agency at work among agricultural labourers having their personal benefit for its only end and object. Many are exerting themselves for the advantage of the farm-servant who (it may, perhaps, displease our correspondent to hear) have no immediate aim at the benefit of his employer at all. If the communication of greater skill, greater bodily strength, greater intelligence, greater prudence to the labourer, be for the advantage of his master, it is well; but it is not on this account that they are being urged upon the attention of the former; it is because they will benefit himself that the labourer is being urged to their acquisition. And, so, if "A Practical Farmer" is ready to admit that the condition of the labourer, irrespectively of his relationship to others, is an important subject, he must allow us to determine the value of the allotment system by its influence upon him directly, and not merely by its influence upon his ability as a servant. It is a very desirable thing, certainly, that farmers should have trustworthy and able servants; but it is rather too sweeping a demand upon the benevolence of the country, to require that it should confine itself in its efforts for the latter within just that stage of its proceedings where they cease to be of any value for the former. And we are persuaded, too, that those who incline to such a demand as this, mistake their own case. It will be found far better to push improvement to its utmost in individuals, and in individual classes, and trust to the inevitable laws of human nature for the growth of right relationship, than to work upon these as if they were things capable of direct creation. Let every means which an intelligent benevolence can suggest for trial, and which an intelligent appreciation of self-interest will lead labourers to adopt, be put in exercise to its utmost: if they can thus be improved as men, we may safely depend upon their being also improved as servants; but let the former be our aim, and let us look for the latter as a natural consequence rather than as the immediate object to be aimed at.

We took exception both to the logic and the data of our correspondent's argument. The former is surely at fault when he supposes the respectability and comfort of the labourer to depend entirely on his ability to do a fair day's work for an employer! and the latter we are bold to assert are erroneous throughout. The possession of an allotment is not incompatible with the due performance of a day's work—the honesty of the labourer has not been injured by granting him a larger garden than common—and allotments are neither conacre nor small farms, the only two Irish customs with which they are likely to be confounded. Our correspondent's own experience of the system is of course to be allowed its due influence in the argument: we can only say that employing men in farming to the extent of some hundreds of pounds per annum—a very large proportion of which is paid for as piece-work, we have not found any difficulty or disadvantage arising from the fact that all of them have allotments. Paying them extensively in piece-work wages, we are able most positively to say that they are as able and willing to do a fair day's work as ever they were: and this may be accounted for by the fact that their allotments, if they do add somewhat to their labour, do also very considerably improve their fare, and in that way at the same time their strength. Many of them keep pigs, all of them thresh out their 8 to 10 bushels of Wheat, and we have found no instance of dishonesty arising from either of these causes. But, the objection under this head, at which our correspondent hints, commonly met with as it is, really does appear to be conceived in a truly contemptible spirit. Are men to be for ever treated as children? shall we never be able to deem them worthy of confidence? It is this very distrustfulness to which dishonesty is often attributable; for what principle can grow which is never permitted a trial? But so little real foundation is there for this objection, that a gentleman of our acquaintance, a tenant farmer, well known in Lincolnshire, positively objects to employ men who do not keep their pig. A well-fed able-bodied man, cost what he may, furnishes cheaper labour than the ill-paid and never-trusted servant of some localities. "We can't *afford* to pay our men less than 2*s.* a day," was the remark of a farmer, who seems to have seen farther than our correspondent into the real interests of both masters and servants, as regards this subject.

Lastly, allotments are neither conacre nor small farms; the former are in the occupation of the head tenant, who sublets a piece, manured, for a particular crop during a single year; the latter are the sole dependence of their occupants; while allotments are the, so to speak, constant occupation of their tenants, and they are small enough to be cultivated during such periods of their time as would otherwise be wasted. In this is their merit, that without taking the tenants from their daily labour, they enable them to turn the spare time of themselves and their children to good account. Greater bodily strength, from the fare which they furnish; greater prudence, from the carefulness they inculcate; greater skill, from the garden education which children will obtain in them, are all probable, and in some cases actual, results of allotments of land to labourers; and we are obliged to "A Practical Farmer," for the opportunity he has given us of more fully insisting upon the advantages of the system than we had hitherto done.

THE BIRMINGHAM CATTLE SHOW.

WILL you allow me half-a-dozen lines to notice a remark in the *Gazette* of last week, which may possibly lead to an erroneous impression. In referring to the Smithfield and Birmingham Shows, you state that "those who desire that their stock should compete only with others of a similar breed, will prefer the latter (the Birmingham show); those who are disposed to support the only opportunity which remains for competition between the breeds, may prefer the former" (the Smithfield show). On referring to the prize lists of the Birmingham show you will perceive, that while in the first instance animals of the same breed compete only with each other for the prizes in the respective classes, there is afterwards a competition between the different breeds for the two gold medals which are offered, one for the best ox or steer in the yard, and the other for the best cow or heifer. In the show of last year, one gold medal was awarded to an ox exhibited by his Grace the Duke of Rutland, and the other to a cow exhibited by Mr. Robert Beman, of Moreton-in-the-Marsh; these distinctions being both carried off, at our first show, by short-horns. I may, perhaps, be permitted to add, that many gentlemen of great experience have expressed a very decided opinion in favour of the principle of classification adopted at the Birmingham show. *T. B. Wright, Union-street, Birmingham, Nov.* 11.

HOW TO MEET LOW PRICES OF GRAIN.

CAN our farmers in the present depreciated state of the corn market continue to raise cereal crops under the established routine of culture, and in the usual ratio of production, relatively with other productions of the soil?

Our reply to this question must be in the negative, unless we except any peculiarly favourable circumstances of soil, climate, and unusual skill and ingenuity on the part of the cultivator. But is there then no other system to which the agriculturist can turn his capital and industry, by which he can provide the means of defraying all the pecuniary outgoings of a farm, and realise a fair return for his labour? or, to come more directly to the point at which we aim, can the cultivator depart from the prescribed path of alternate husbandry (white and green crops succeeding each other) which has been established as the most perfect and remunerating, without loss to himself?

The alternate system has so long prevailed, with all its adjuncts of machinery for raising corn and sending it to market with rapidity on favouring opportunities, that the farmer is unwilling to abandon it in any measure. He still adheres to it from habit and predilection, and cannot easily be persuaded that he may depart from the prescribed track—change his course—accommodate his practice to altered circumstances, and instead of abandoning his farm, involving his landlord in embarrassment, and his labourers in pauperism, proceed in a manner which may yield a remunerating return. If a manufacturer finds that the fabrication of one article of his trade is unprofitable, he turns his attention to another branch of industrial labour, and adjusts and applies his machinery—both animate and inanimate—accordingly; and though during the transition period he suffers loss and inconvenience, his energy and perseverance enable him to surmount his difficulties. In this the farmer may see an exemplar worthy of his imitation. Though he cannot grow corn crops with profit, while our ports are open to the admission of foreign grain which can be raised on cheaper terms than the British farmer can produce them under the present burdens upon land, we have a notion that our farmers may even now rear and fatten live stock and produce milk and butter and kitchen vegetables, very beneficially, through the agency of green crops, though they may cease to grow corn, except in proportion commensurate with the wants of their domestic and farm establishments.

We anticipate the objection that the prices of milk, fresh butter, and butcher's meat, &c., cannot be maintained at remunerating rates if bread be extremely cheap. It is popularly believed that Wheat is the standard by which the general articles of agricultural produce rise or fall, and therefore, since there is no prospect of a dear loaf, there can be no just expectation of a good price for the other productions of the soil. Now this is delusive reasoning—in our humble judgment; assuming the prosperity of manufactures and the employment of the people generally, the cheapness of bread occasions an increased demand for milk, butter, meat, and the roots in which the green-grocer trades. If a working family earn more than enough to procure bread, they will expend a great part of the surplus in the purchase of these other articles of food; if, on the contrary, they can barely procure bread, they have no means of buying other agricultural productions—not even butter for their bread, which, under the contrary circumstances, they would "butter on both sides."

We may defy foreigners in general to send us fresh meat, at least such as we can produce. Let any one who has travelled over Belgium, Germany, and France, say if he has seen meat in the best shambles equal to what may be bought every market day in our country towns and villages. While their miserable sheep are kept in foul stables more than a moiety of their time, and without food, and poorly fed at all times, what is to be apprehended from competition with them, or with the carcases of old over-worked tough oxen, and cows of a certain age?

New circumstances demand a remodification of what was an admirable system. It is, we venture to say, a mistake in theory to hold that the principal value of green crops arises from their agency in creating manure for the succeeding cereal crops, which are to be the main dependance of the farmer for realising money. The green or forage crops should, at least in the pre-

sent times, be regarded as more directly remunerative in themselves, inasmuch as live stock fed upon them are the present and prospective sources of profit, in consequence of the general prosperity of the consuming classes. It may be urged that a more extended cultivation of green crops (with a diminished production of corn), will require more labour, and that an increased expenditure for this is out of the farmer's power. We rather question the validity of this objection. When all the labour necessary for the perfect culture of corn —of Wheat more especially—is considered, the hand-hoeing, weeding, reaping, binding (at the season when labour is most dear), threshing, and carrying to market, it occurs to us that no more hands are required in the management of forage crops than in the management of cereal crops.

The want of sufficient straw for fodder, and the dunghill, consequent on the proposed alteration of system, is however a difficulty; but not of a formidable kind. We are assuming that corn will be grown in sufficient quantities to supply the wants of the farmer's establishment—bread and porridge for his whole household, meal for fattening pigs, Oats for his horses, and if to this we add the suggestion that labourers with families should be partly paid, on the Scotch principle and practice, in grain, the total quantity of grain crops required on a farm would be in most cases such as would supply a good deal of straw, sufficient, at least, for the bedding of horses and cattle. In some cases Heath, Rushes, Sedge, Ferns, leaves, &c., are procurable at the cost of labour alone; but is straw or any other litter indispensable if merely considered as a material for creating putrescent manures? In the advanced state of chemical science, have we no sufficient resources in artificial manures so portable and so easily applied? or in the mineral manures with which so many localities abound, and in the rank sewerage of cities and towns, which will, no doubt, be applicable to the soil in a concentrated and portable form, through the length and breadth of the kingdom, before many years shall have passed over our heads? Is the folding of sheep on Turnips, &c., an inconsiderable means of manuring? Are the liquid treasures of the tank of little amount? In truth, the varieties of productions which our farmers could raise are so numerous, that successions, as in gardens, might follow each other continually, without any exhaustion of the powers of the soil, and to the infinite increase of manure, so that even the precious Potato should have an ample share of it, though, for this production, mineral manures (lime in every form) and ashes are the most suitable.

Potatoes.—This is a key note which introduces Irish agriculture to our attention for a moment. If our previous notes have had true tone, they will possess more force when Ireland is the theme—because the climate of that country, generally, renders it far more fit for the culture of green crops than for that of Wheat or Barley, and because the farmers of Ireland, *en masse*, are far less interested in sustaining the high prices of grain than English farmers. This arises chiefly from the following circumstance. In England the farmers till on a great scale; in Ireland on a small scale. A large proportion of the cultivators in the latter country holds from 5 to 20 acres: let us assume that a family there, not deficient in capital or skill, occupy a farm of 10 acres (a common case) of good Wheat land; we believe that the reduction in the value of corn occasions no loss to them. If they consume the corn grown on that little farm, as would be the case if they were in comfortable circumstances, it signifies nothing to them whether Wheat be worth 4*l.* or 40*s.* per quarter—and so of Oats or Barley—on the supposition that their land, cultivated with due regard to successions, produces no more corn than is required for their domestic use. We assume that the rent is paid by the sale of milk, butter, or of pigs, and that the surplus profit is expended in fuel, clothing, candles, salt, &c., and trifling articles of furniture, all of which are purchaseable at a much cheaper rate than when bread was dear. In the case of a tenant of 30 or 50 acres, and upwards, there must always be, according to his station and mode of living, a certain portion of the farm deducted in his calculations for the production of the food consumed by his household, and, therefore, in the debtor and creditor account of the farm, it is a matter of indifference whether the productions of that portion be dear or cheap in the market. The question of prices only becomes important as it regards the market produce of the portion of land over and above that which is required for the maintenance of the farmer's family. The smaller the size of the farm, therefore, the less important is the question to him, and even as regards the surplus quantity of land, whether it be much or little, and it is but little as regards the bulk of Irish farmers, the reductions of rent, of labour, seed, manures, implements, clothing, &c., consequent on the depreciated value of corn, make them really gainers by the present state of things. The farmer on a small scale is not injuriously affected anywhere throughout the United Kingdom by the cheapness of bread if he farms judiciously. With the extensive farmer of arable land, under high farming, the case is very different indeed, and his condition can only be improved by changing his system from corn growing largely to the raising of other market productions, which every well wisher of the people generally would desire to have brought within their reach. Why should not the working man have meat as well as bread?

Believing that two farmers holding 500 acres each would produce more from them, and employ more labourers than one farmer cultivating 1000 acres (and the great farmers are, as we have before intimated, the chief sufferers by the depreciation of corn) we are inclined to wish that farms were generally of smaller size in England to suit men of limited capital who (with three-fourths by the way of that formerly deemed necessary) might pursue such a system as the altered circumstances of the times require, and such as would be sufficiently remunerative.

Why may not our farmers, with their numerous facilities of obtaining manures, cultivate some Rape (Colza, rather) in the strong clay soils for the seed, and hemp, and Flax, to a considerable extent in appropriate soils? When Wheat bore a higher price than now, we have seen Colza cultivated extensively in the North-West of France, in preference to it. The demand for the oil expressed from it is very considerable, and the value of Rape-cake for agricultural purposes is well known. Hemp and Flax are highly remunerative. The Belgian or German farmer of 100 acres will often have 10 acres of Rape (for seed) or Flax for seed and manufacture. Linseed-oil is a treasure to the cattle-feeder; and the farm accounts of the foreigner will show a credit of 150*l.* for those ten acres. Some millions of British capital are annually sent out of the kingdom for Flax to supply the requirements of the linen manufacture; and though any of our farmers may satisfy himself that Flax is easily cultivated and highly remunerative on any good Wheat or Barley soil, he does not cultivate it, "because it is new to him,"—"because he does not understand it." Let landlords relax their stringent covenants regarding its culture, under reasonable requisitions, and let a few farmers combine here and there to bring an intelligent Flax cultivator from the north of Ireland, in spring, to show them how to sow the Flax seed, and in autumn how to pull the crop and prepare it for the market. On an average a crop of Flax will double the value of a crop of Barley, and in no case does Clover succeed better than when sown with the Flax.

It is by no means in a political view that we urge the culture of Flax, but merely as a substitution for some portion of cereal crops. Any attempt to force the substitution of home-grown Flax for Cotton—by means of combination and the excitement of popular feeling against the use of Cotton—would, in our judgment, be absurd, and have the contrary effect from what it is desirable to produce, by leading away the attention of those who are anxious to promote the increased consumption of Flax, from the only true means of attaining their object, viz., by reducing the cost of its production as compared with that of Cotton. There is ample scope for both manufactures. Cotton is more adapted to some purposes than Flax—and Flax might be beneficially substituted for some of the uses to which Cotton is applied.

We only particularise Flax, Hemp, and Rape, as instances of changes that the farmer may make with some advantage to himself. To attempt any detail of what might be effected by raising more abundantly crops not commonly cultivated for cattle and pig feeding—and by calling forth greater powers of vegetation from the soil by more skilful husbandry—which ought not to be unimproved—when everything else is in progressive improvement, would be superfluous. *M. D.*

ON THE CULTIVATION OF WHEAT.—No. I.

After Mr. Hewitt Davis published his opinions on the great advantages to be derived from very thin seeding, I was induced to commence a series of experiments to test fully the merits of his system (being much at variance with the practice of our most eminent agriculturists), well knowing that no single trial could satisfactorily decide the point. With your permission I lay the result of my trials before your readers, as I feel that in times of agricultural depression like the present, anything that may tend to benefit the farmer ought not to be withheld. My experiments were all conducted under my own observation and with perfect fairness, for I had no other object but truth in view. It mattered little to myself, in a certain sense, whether 3 pecks, or 10 pecks of seed Wheat per acre were the proper quantities to sow. *Experiment No.* 1.—October 15, 1844, on a piece of white Clover ley, having been summer eaten with sheep; three slips of land, about 1 rood each, contiguous to each other, were drilled with Wheat, the quantity of seed on each being different, at intervals of 7 inches, a row being left unsown between each plot of land.

	Seed per acre. pecks.	Produce per acre. bush. pk. gal.
No. 1	7	34 3 1
2	5½	34 0 1
3	11	33 3 0

The soil, a good gravelly loam, but not in a very good state of cultivation. *Experiment No.* 2.—Three pieces of land, a row left unsown between each, were drilled at 7 inches apart on the 20th of October, 1845, with Wheat; a different quantity of seed being sown on each plot of land, the result proved as under:

	Seed per acre. pecks.	Produce per acre. bush. pk. gal.
No. 1	7	47 3 0
2	6	45 1 1
3	8½	45 0 0

This trial was made after a good crop of red Clover, eaten on the land by couples, having at the same time much dry food. Soil, a good gravelly loam, in an excellent state of cultivation. *Experiment No.* 3.—On the 8th of October, 1847, about 3 roods of land, lying beside each other, were drilled as before, with my imperial white Wheat in rows at 7 inches, on an old white Clover ley; the quantity of seed per acre differed, as in the foregoing experiments:

	Seed per acre. pecks.	Produce per acre. bush. pk. gal.
No. 1	6	42 3 1
2	9	40 2 0
3	12	40 1 0

The soil in this case differed from the two last, being very loamy, on a dry subsoil; good land, but farmed in an ordinary manner. *Experiment No.* 4.—October 7, 1848, I made the following trial, and sowed two plots of land with less seed per acre than I had done before. These, with another piece, were drilled at intervals of 8 inches.

	Seed per acre. pecks.	Produce per acre. bush. pk. gal.
No. 1	7	50 2 1
2	4	43 0 0
3	3	41 2 1

The land on which this experiment was made is a gravelly loam, and in excellent order. The Wheat was after Clover ley, summer eaten by couples, having in the spring a considerable quantity of dry food thereon. The Wheat was my imperial white. Nos. 2 and 3 suffered much from mildew, and consequently the quality was not so good as the produce of No. 1. *Experiment No.* 5.—October 10, 1849. Two pieces of land beside each other were drilled at intervals of 8 inches, having a row left unsown between each, with my imperial white Wheat.

	Seed per acre. pecks.	Produce per acre. bush. pk. gal.
No. 1	7	40 0 0
2	4	39 2 0

The land on which this trial was made is a fine gravel soil of excellent quality, and was highly farmed; the Wheat being after an excellent crop of red Clover, summer eaten by ewes and lambs, having at the same time much dry food. This experiment differs much from the last; but I state facts, and wish others to draw their own conclusion. This season mildew was very prevalent, but both these pieces of Wheat ripened very kindly. The above experiments seem to show that 6 to 7 pecks of seed will produce more Wheat than 9, 11, or 12 pecks of seed per acre, by an average of 2 bushels; this added to 1 bushel less seed, makes a profit of 3 bushels of Wheat per acre, and is decidedly against very thick sowing. The last trial, however, seems more in favour of thin seeding, but it must be remembered that the land, as before stated, was in an excellent state. These experiments have not proved quite so satisfactory as I could wish; but it would appear that the proper quantity of seed Wheat per acre is somewhere between 4 and 7 pecks, to be drilled on good land in fine condition, and in the early part of October; but it would not be safe to sow less than 7 or 8 pecks on the general average quality and condition of the land in this country. No rule can be laid down as to the proper quantity of seed per acre, as much depends on the nature and condition of the land and time of sowing. I have made several experiments between drilling Wheat at 7 inches apart in the rows and 9½ inches, and found the produce much the same, which has induced me now to drill my Wheat generally at 8 inches, being a very convenient distance. I have not given any account of the different qualities of the grain, neither noticed the weight of straw, as it would have increased the trouble in conducting these experiments, which I found to be great, being connected as they were with many others as to the relative merits of different varieties of Wheat, which I probably may lay before your readers. If more attention was paid to the different sorts of Wheat, a greater benefit would be derived than most farmers imagine. Much more might be written respecting the disadvantages of very thin seeding, but I think enough has been shown to caution those who have doubts on the subject. I must however confess, that the country is indebted to Mr. Hewitt Davis, in drawing the farmers' attention to his system, as it must be admitted that a greater quantity of seed corn than necessary has been sown and wasted. *T. E. Pawlett, in Bell's Weekly Messenger.*

Home Correspondence.

The Great Agricultural Movement in the Growing of Flax.—A company, comprising many of the leading nobility and landowners, is seeking from Government a Royal Charter to give encouragement to agriculturists and farmers to bring into immediate cultivation, at least one hundred thousand acres of land, for the production of Flax-straw; which substance, the promoters of the charter have (by new and peculiar processes never hitherto adopted) the power to convert into a fit state to hold competition with the best Flax imported from foreign nations, without the aid of steeping, kiln-drying, or mill-scutching. The machinery by which the fibre is separated from the stalk, without steeping, is of a very simple and inexpensive kind, requiring no previous knowledge to work it. The unsteeped Flax is uniform in strength, and free from stains, so that all after-processes of manufacturing and bleaching may be conducted with a facility and exactness not hitherto attainable. *T. S.*

High Farming.—At the close of the "leader" in the *Agricultural Gazette* of the 19th ult., the following occurs:—"We may depend upon it that upon the relation between the means of the farmer and the extent of land he aims at farming, depends the profit or loss in agriculture: and high farming, as Lord Stanley has told us at Bury, and Mr. Rigden shows us at Brighton, is the only way to meet low prices." Now it would appear from this that high farming is to be a

panacea for all the ills that free frade is heir to ; but I can illustrate a case that will show the fallibility of such an oracle. I have a pet close near to my house, which has been pretty well farmed for some years ; but as high farming is rather an indefinite term, I venture to say it has been as well cultivated as the heath at Tiptree, the downs at Sutton Waldron, the garden at Wix, or even the ultra high farming at Auchness (minus the sea weed dressings). In the spring of 1849, the field was prepared for Mangold Wurzel, and had a liberal dressing of compost, *i. e.*, farm-yard manure, maiden soil, and road scrapings well mixed. In April the seed was sown, and a good crop (upwards of 30 tons per acre) was the result ; the roots were harvested, and the tops nearly all ploughed in about the middle of November—(there was no perceptible difference in the succeeding crop, where the tops were drawn off or not). On the 5th and 7th of February last, the field was dibbled with about a bushel and a half of Wheat per acre ; the crop looked well until the latter end of July, and was estimated by some neighbours at 40 bushels per acre ; indeed it did look good for that ; the sequel is, I shall be glad to sell it for 20 at 4*s.* 6*d.* per bushel. I can show another case of a close in my occupation, where anything but high farming has been practised, the produce of which is at least 35 per cent. more, and 20 per cent. better quality.—Thus far was written a fortnight ago ; but from a feeling of diffidence in "rushing into print," the paper was burked, and certainly would not now have seen the light, had not "E. X." challenged any one, last week, to say he ever grew "unkind Wheat" after roots, particularly Mangold Wurzel. *Jas. Biggs, Desborough, Nov.* 5.

Farm Accounts.—A correspondent desires an opinion on the system of keeping accounts relative to a farm, as published by the Royal Agricultural Society and in the Cyclopædia of Agriculture. I have seen neither of the above—but being thoroughly acquainted with accounts generally, as employed in many concerns, I venture to give you my opinion as to a mode I should adopt were I a farmer ; and which mode, were it adopted by all, would prevent that fallacious mode of giving statements that are with ease upset by any one conversant with figures. I have never seen any system that sufficiently individualises ; matters are too much "lumped" together, to render any account satisfactory to the minute enquirer. Of course a perfect system cannot be developed in a single letter, but the leading heads may be considered as follows. 1st. Every careful farmer must keep a "cash book" to contain every shilling paid and received. 2d. A "day book," to contain a daily entry of every expense incurred in the cultivation of a farm ; arranged under various heads and applicable to the various fields under cultivation, whether of pasture, corn, green crops, roots, &c., or woods. 3d. "A ledger," to be opened with various headings, viz., every field on the farm, of whatever nature it may be ; also of every character of stock that may be fed or used on the farm, &c. Then each entry or field must be debited with an estimated proportion of the rental, whether arable, pasture, or wood land ; afterwards, with each succeeding expense incurred, as shown by the "day book," from Michaelmas to Michaelmas, also with the tithe, &c., and when the amount of capital employed in the cultivation of each field for the year is known, then with the interest of capital ; this will give the whole debit. The credits must be arrived at by the realised produce of the crop, whether in grain, straw, hay, &c. Stock must be debited for the cost price, interest of money, food per week or month, derived from the growing crops, and consequently the fields growing them credited, in order to arrive at the profit or loss of each undertaking. Should this simple statement meet the views of your correspondent "E. F." page 700, I shall be happy to enter more fully into the subject. *W. F., Gay Bowers, Danbury, Essex.* [And we shall be very happy to hear from you.]

On High Farming.—Under this head a correspondent, "E. X.," in your Number of Nov. 2, challenges any one to say that he ever knew unkind Wheat after roots, particularly Mangold Wurzel. Unkind is an indefinite term, but here it must have reference to blight. I had this year a piece of Wheat some with and some without active manure, part after Clover, part after Potatoes, part after Carrots, and part after Mangold Wurzel—all equally blighted. It was to the eye a most beautiful crop, admired for its cultivation by all who saw it. It may, perhaps, yield 2½ qrs. per acre, just half the estimated crop. I have at least learned one truth, that high farming has its drawbacks. The best farmers have suffered most in this neighbourhood ; one farmer offered 100 acres of Wheat in open market, to any one who would harvest it and leave the straw. *J. C. C., Nov.* 5.

Lime-Ash floors for Straw-houses or bays of Barns.—Having found them to answer perfectly when laid on a level and dry under-surface, and the question being their cost, I have the pleasure of forwarding you the account which my clerk has kept of a floor 20 feet by 21.

	£	*s.*	*d.*
60 bushels foundry ashes	0	5	0
10 sacks of lime	1	0	0
4½ days, 1st mason, at 2*s.* 6*d.*, ...	0	10	7½
4½ days, 2d ditto, at 2*s.*	0	8	6
4½ days, labourer, at 1*s.* 6*d.*	0	6	4½
420 feet (= to 47 yards, at 13*d.*)	2	10	6

This includes all the expence of preparing the under-surface. On November 2d the floor was finished, having occupied 3¾ days in laying ; ½ day, November 5th, was required to level off inequalities of surface, and roll and beat it. This day, November 9th, the floor is so dry, it is fit for the sheaves to be laid on it for threshing the day after to-morrow on the adjoining floor. The foundry ashes cost nothing but carriage ; if a larger space had been executed, the expense per yard would have been less, I imagine. *F. P. B. M., Nov. 9th.*

Hybrids.—Some time ago one of the supposed hybrids, between the common fowl and the guinea fowl, was lent to me, but its appearance at once satisfied me that it was no hybrid. *Sylvanus.*

Rape for Seed.—Can you give me any information on the subject of growing Rape or Colza for seed ? I see that it is grown in several of the eastern counties, and very extensively in Belgium and Germany, in which last country it is considered the most profitable crop of all to the farmer ; more so than Wheat. The present price of Rape seed in England is stated to be between 6*s.* and 7*s.* per bushel, and the produce to vary from 30 to 50 bushels per acre. Now, if this be so, it might be used as a substitute for Wheat at the present moment, and thus furnish an answer to the question so frequently put by the farmer—"What can I grow instead of grain ?" It is hard likewise on the farmer, in these days of free-trade, that the law should prevent him from growing another crop, which is universal in Germany and Belgium ; viz., Tobacco. As long as he was protected, he had no right to grumble, but now that he is thrown into competition with the crops of the whole world, it is the height of injustice to tie up his hands in any way whatever, from using every means in his power to start fairly in the race. *Agricola.*—[The following describes the practice of Rape culture in Flanders ; it is from a forthcoming number of Blackie's "Cyclopedia of Agriculture." "Rapeseed is only cultivated in the most fertile quarters of the middle of Flanders, and in the polders. Commonly, it is planted either after Potatoes or Flax, or after Wheat or Oats, in the following manner :—As soon as the Wheat or Oats are reaped, the stubbles are ploughed four inches deep ; then the ground is harrowed, and the stubbles and weeds are gathered and carried away, or burned upon the land, if they are dry. Thereafter, 10 to 12 cart-loads of manure per acre are laid on the land, which is ploughed under at a depth of 14 to 16 inches ; and at the same time the land is laid in ridges of 8 furrows each, and then left for some days. It is then worked over twice with the heavy harrow ; then again ploughed at a depth of 12 inches. Upon the ridges, then, the land is worked smooth with the subverted harrow, and if the soil is light and dry, it is rolled. At last the Rapeseed plants are *set* towards the end of September, with an implement for the purpose. With this implement, a series of double holes are made, at a distance of about a foot from each other, or else this is done with a very broad spade, whilst the rows keep a distance of more than half a yard. About the middle of November, they dig between the rows, and set up the clods, in order to secure the plants, as much as possible, from wind and frost. Others, who wish as much as possible to save the manual labour, set the plants with the plough. They do all the work as described till the manure is spread over the ground. Then they make with the plough a furrow of about 8 inches deep. A man, following the plough, puts some manure in it with the dung-fork, and is followed by five women, who bear the plants in their arms, which they lay against the right side of the furrows, at intervals of a foot. When the labourer returns with the plough, he covers the roots. In many of the enclosed carses, or polders, where they desire still more to save labour, many farmers do not transplant at all from a seed-bed, but sow the Rapeseed in the land where it is to grow, taking care to thin the plants when they stand too thick. Early in July, the Rapeseed is cut with the sickle, and turned the next day, while the plants are wet with the dew, in order to prevent the loss of seed. After four or five days, it may be dry, if the weather is favourable, and then it is immediately threshed upon a linen cloth in the field, after which the seed is carried to a dry loft. In some districts of Flanders, it is customary to put the Rapeseed in cocks, leave it so for four weeks, and then to thresh it. They do this in order thoroughly to ripen all the seed."]

"*No Business so Ill-conducted as Farming.*"—Such was, some years back, the remark of an old tradesman, who, having by strict attention to his business, become a landowner, had turned his attention to farming. Though at the time I might feel somewhat indignant at the imputation on my class, especially coming from one who knew better how to handle the scales than the plough, I am constrained to acknowledge that observation has, since then, convinced me of its general truthfulness. The absence of regularly kept account-books is alone enough to substantiate the charge. In no other business would a man think of groping in the dark, unable to ascertain the relative cost, profit, or loss on each branch of his business, as the farmer does. If the concern be so large, or the manager so incompetent as to require it, the farmer should employ a book-keeper. If, by his aid, the profit or loss on each department could be correctly ascertained, the expense of such an individual might soon be repaid. Of course he must be a man of a stamp somewhat different from the office-keeping clerk of the tradesman. He must not be a mere house mouse ; he must go into the fields and measure land, calculate the cost, and ascertain the produce. He must gauge, weigh, count, and record the particulars of each kind of produce, so that the farmer may see which crops or practices it is desirable to extend, and which to retract or abandon. He must also be able to prove by his books what is the annual amount of profit or loss on the whole farm. The want of such a system has taxed the farmer with the payment of income tax, when, as is now too generally the case, he has been reaping a loss, instead of a profit, by his business. It would be a good example if some landlords would immediately begin to employ properly qualified clerks to keep their farm accounts, and a patriotic act to publish them, together with the particulars and results of various experiments, which it is more within the province of the landlord than the tenant to make. How many errors have been persisted in from want of clear accounts ! How many beneficial alterations might farmers often have made in their practices, if they had possessed the proofs which such accounts would have supplied ! How often would even clever practical men find that their judgment had deceived them, if they were able to ascertain the amount of cost and produce, of profit and loss on each crop or animal. By way of illustration, I will just mention a case or two. A labourer, who had a single pig, which he had bought, thought it had done "varra weel." He had purchased a great part of its food, and gave an account of the Potatoes it had consumed. These items were added up, and upon valuing the animal according to his and our estimate of its weight and worth, the poor man was surprised to find that he had been feeding a robber ; his pig, which he thought had done so very well, had actually "eaten its head off." In another case, an experienced farmer was so confident that his own crop of broadcast Turnips was heavier than that of his neighbour, in Scotch drill rows of 30 inches apart, that he backed his judgment by a bet. To decide this an average plot in each field was measured and weighed, and to the surprise and mortification of the owner of the broadcast Turnips his crop proved to be the lightest. These facts evidence the importance of keeping accurate accounts, and testing judgment by weight and measure, cost and produce. This subject naturally leads to another, namely, that of agricultural education, on which I propose making a few remarks in another letter. *O. F.*

Hoeing of Wheat.—In the operations of art, we must imitate the processes of Nature, observe her rules, and estimate the results. Labour is useful only when associated and acting with the laws of Nature. The exertions of the mind and the actions of the hand are applied to place substances in the position of beneficial relationship, and matter itself produces the results. The husbandman sows the seeds, and the crop is produced by the voluntary agencies that are exerted in consequence of the positions of the seed in the ground. Much the greater part of practical knowledge is derived from observation and experience, and extended according to circumstances. It is observed that green crop plants, as Turnips, Potatoes, and Beet-root, expose the land during the young growth, and thereby afford an opportunity of killing all the weeds, and pulverising the soil. When this purpose has been effected, the plant reaches maturity, produces a broad foliage, which overspreads and covers the soil, excludes the sun, retains the moisture, and produces a mellow decomposition beneath the shade of the leaves. Much of the benefit which the land receives from the green crop culture, is derived from this source. The low growth of the plants allows the working and cleaning of the land during almost the whole summer, at least far into that season, and, thereby confers the benefits of cleansing and pulverisation. The cereal crops, as Wheat and Barley, quickly rise to height, because Nature directs the maturation of seeds during that year. Any working or cleaning of the land is thereby excluded, and as the produce lies in the ear, and not in the roots, the wide placing of the crop in drills would reduce the quantity returned. The fibrous roots do not pierce and divide the soil, but creep along the surface, and consolidate instead of loosen the land underneath. Nature has most evidently intended the plants for contrary purposes, which have been carefully observed, and studiously adopted. The very great success of drilling green crops extended the idea to cereal plants, and machines have been devised for the purpose of inserting the seeds in narrow rows. The intervals have been tried to be cleaned and pulverised by means of horse and hand hoes, and much benefit has been supposed to be derived from the practice. But, as before observed, the crop soon rises to height, and prevents the labour of cleaning and pulverising, and the weeds are more encouraged than checked by the very partial hoeing that can be done in the early summer. [?] *J. D.*

Ventilation.—There is a plan adopted in many hospitals and workhouses to ventilate the apartments and sick wards which is simple and most effectual ; preserving the rooms from draughts, and yet keeping them sweet without being too cold. Round the ceilings and across, at stated distances, zinc tubes are fixed, connected with each other, and perforated with very small holes, having two or more open ends passing through the outer walls, protected by a shade to prevent the rain beating in. The extremities of the tubes may also be furnished with a cap, to close them up in severe weather, which however is, I understand, never necessary if the tubes are properly constructed according to scale, with reference to the size of the room, and number of inhabitants. The same principle may be applied to stables, cowhouses, &c. It is a cheap method of ventilation, and answers perfectly. *Falcon.*

Mr. Piper's Wheat.—With reference to an extract made from the *Ipswich Express*, relating to the system pursued by Mr. Piper, of Colne Engaine, in Essex, of

growing Wheat year after year on the same ground, without ploughing, which appeared in your Paper of the 9th inst., I should be extremely obliged to that gentleman if he would kindly reply to the following questions.

1. The nature of the soil and subsoil on which the Wheat is grown?
2. The height above the sea?
3. When the corn is dibbled in?
4. What manure, when, and how much per acre he puts on?
5. The cost of manure?
6. Does he harrow the ground after sowing?
7. Is the manure applied at seed time, or in the spring as a top dressing?
8. How often is the ground hoed after the Wheat is up before harvest, and whether with horse or hand hoe?
9. How many acres does he plant in this way?
10. What has been the average of the crops up to the last harvest?

The knowledge of these points may assist others to decide if Mr. Piper's plan is likely to answer as well in other localities, as it is stated it has done on his land. *J. M. Tylden, Milsted, Nov.* 10.

Education.—It is a question, whether a man who has to work for his daily bread may not be over-educated, imbibing false notions of his own importance, which may prove a stumbling-block as he advances towards an age when he must provide for his own wants, independent of his parents. A moderate knowledge of reading, writing, and arithmetic, is quite sufficient for a man whose occupation is to be that of a labourer or artisan. A proper proceeding in the above useful aids in life gives hidden talent an opportunity of shining forth, and raising the possessor to the highest position attainable by real ability, whereas all the cramming of the most persevering schoolmaster will not furnish a dull head with brains, but may impede the owner's progress, by making him vain of his superficial knowledge, thus unfitting him for the laborious station to which he was born, and converting him into a dissatisfied member of society. In our free country, genius will push a man from the lowest to the highest step of the ladder, if properly directed, more surely than skin-deep accomplishments, which although being delightful to meet with, will not preserve an individual from starvation, who has nothing to look to for support but his manual labour. Even in the higher ranks of life we shall soon discover that an expensive college education, resting upon Greek and Latin, must be changed for something more useful, where younger sons have no sinecure places in anticipation. The introduction of railroads and free trade have altered the aspect of things in this country; no man can afford to be idle; there is a kind of equality existing amongst certain classes, which is fast introducing the necessity of men placing their pride of birth in their pockets, and trusting more to honesty of principle and untiring exertion to maintain their position in society. Nominal riches will no longer bear up an individual against the storm which is raging amongst those whose property is involved in difficulties, which low prices increase. *Falcon.*

Farm Accounts.—The simplest and best system of accounts for the farmer is the common ledger. This shows at all times, and at once, the exact state of affairs on the farm, and the exact amount of profit and loss in everything; with the exception of a labour-book, you require no other account book whatever. The labour account book of the Royal Agricultural Society of England is good, but a little alteration in the size and arrangement of columns would make it infinitely better. *J. R. Markby.*

Animal Heat.—I always read the *Agricultural Gazette*, and although no agriculturist, I feel the greatest pleasure and interest in perusing articles generally written with good sound reasoning, and the results of practical men. In last week's *Gazette*, however, you have a correspondent, "J. C. H., Croft Farm, Bridgnorth," who, among other learned theories, gives one on digestion that is perfectly startling. He says, "The organs of digestion are exquisitely arranged, for when the food is introduced into the stomach, it is, by the action of the gastric juice (which is secreted from the lining of the stomach), reduced to a pulp and removed to the liver, where it is purified, and then conveyed through the lungs, &c., &c." What does he mean? God bless us, we are wonderfully made! Does he intend to insinuate that the food passes from the stomach through the liver, into the lungs? Where does it go to then? Fancy a pound of beefsteaks with its alliaceous accompaniments taking that route, or as he further states, an ordinary Arctic meal of 5 lbs. of blubber, with train oil and brandy "à discretion." Dear Mr. Editor, believe me, I have a great respect for you personally; come not in contact with any man if he digests his food in that way—associate only with those who perform that function in the mode described by John Hunter, and other steady physiologists. There is no calculating what new diseases might be generated by this doctrine, and certainly no guessing what remedies would be of use in them. Pray do advise your correspondent to consider what a digestive revolution he is promulgating, and to spare the feelings that every poor man must have, when he eats with a good appetite his frugal meal of bread and bacon. Your *Gazette* is read by all classes, and all should be equally benefited. "A little knowledge is a dangerous thing." *An Ordinary Digester.* [Your witty criticism is too unwilling to admit the possibility of "J. C. H.'s" remarks bearing a construction accordant with the truth. He probably meant to say, that after the food had been reduced to a pulp it was brought under the action of the liver before it was removed to the lungs—the fact being that the absorption of the chyle is effected after its mixture with the bile, by which the nutritious parts of the "pulpy mass" passing out of the stomach are separated from the innutritious; so that the "purification" of the "pulpy food" by means of the liver, previous to its conveyance through certain absorbent vessels and the heart to the lungs, is no fiction.]

Wheat Growing in Ireland.—During my travels through the various parts of England, enjoying the hospitality of English farmers, stewards, and farm bailiffs,* I have had many interesting discussions on Wheat growing, amongst other subjects, and was surprised to find in many cases an objection to the culture of Wheat on land that had previously grown Potatoes, whereas in this country we had always found the best Wheat crops as the successors to Potatoes on what is termed Wheat soils. This great contrast in the success and failure of Wheats in the two countries, so contiguous to each other, I have endeavoured to reconcile as attributable to the following causes. First, having found that Potatoes in England had formerly at least been generally grown on light lands, whereas in Ireland they have been grown on all kinds of land. Secondly, there has been less attention paid to the culture of Potatoes, and general fallowing of the Potato land in England than has been bestowed on land producing other green or fallow crops, whereas in Ireland the Potato culture was that most and other green or fallow crop culture that least attended to; and finally, nature has done for us in many cases what it required art on your part to effect on land which had previously grown Potatoes, namely, by mechanical and chemical means to render light land heavy by compression, and the supply of ingredients in which, for Wheat culture, it is deficient; and hence our deficiency of produce on light lands compared to the produce obtained by you generally speaking; and this suggests another contrast in the success of Wheat culture on Irish soils—between English and Scotch stewards, on the one part, and Irish stewards and Irish farmers on the other. In the case of the first I have almost universally observed through this country crops of Wheat much lighter in quantity and much inferior in quality, compared to those grown by the second. This I attribute to the following causes; the English and Scotch stewards cultivate their lands principally, nay I may say in all cases, by the mere use of the plough and harrow, aided latterly by the grubber. The Irishman ploughs and harrows his lands too, perhaps, not so well, but he makes up for his deficiency in ordinary ploughing by the additional use of the plough, and far better, the spade, by raising the subsoil in the furrows and casting with his shovels the contents of the same over his beds or ridges when the seed is harrowed, ribbed, or drilled in. I have myself made many interesting experiments in this way. Indeed I have gone so far as to redig the furrows in spring, and use their contents as a top dressing on the Wheat, when having got its usual spring hoeing or harrowing; and the increased produce from crops so treated, compared with those on land treated according to what some would call improved English or Scotch farming in Ireland, has often paid from 500 to 600 per cent. interest on the capital expended in such manual or spade labour. I found another advantage in this system, as I have by such means restored to fertility in Clover growing land hitherto considered "Clover sick;" but the greatest advantage in this system of late, especially, was the giving employment to the people "to enable them to support themselves," instead of being caged up in the workhouses, so called, living on other men's industry, whilst learning the way by which they could receive "the wages of sin." *Edward Carroll, Beg Erin, Castlebridge, Gorey, county Wexford.*

Wheat Culture.—As every quack has a nostrum for the improvement of agriculture, allow me to propose mine, and, if convenient, favour us with your opinion of its practicability. The following remarks refer to the cold and wet climate of North Lancashire, but they may be found partially applicable elsewhere. Can we adopt any plan which is likely to materially increase the growth of Wheat? and if so, can it be done profitably? The growth of Wheat is subject to so many unfavourable influences, and in our uncertain climate we can so little calculate upon having favourable weather at critical times, that it is problematical whether manuring the land for Wheat does more harm or good. If we manure with farm-yard manure, and the season proves unfavourable, the plant runs into straw, is beaten down by the wind and rain, and becomes tainted with rust and mildew, and the sample and yield are both indifferent; and, therefore, as bad seasons for Wheat are more frequent than good ones (in Lancashire), the safest plan is to have the land poor rather than too well manured, especially with ammoniacal manures; it is my firm opinion that in the cold season of 1845 every shilling expended in manuring Wheat in this neighbourhood made the crop a shilling worse than if there had been none applied, and the only tolerable sample of Wheat I saw growing that season was in a field which had in it a second crop without any manure. On the other hand, to take an extreme case, I saw a field of 20 acres, which had been thoroughly drained and manured, and the Wheat, up to the beginning of May, was as promising as any field I ever saw, the steward of the estate then remarking to me that the crop would pay the whole cost of draining and manuring, and yet when it was threshed out, it only yielded 1 quarter per acre. But if we could discover a sort of Wheat which produced straw a foot shorter than the usual length, and ears of an inch longer, such a variety would stand all sorts of weather without being beaten down, and we might then safely manure far more highly for Wheat than we can at present, and there would be far less risk of mildew or disease of any kind than there is when the crop is laid as flat as if a garden roller had passed over it—the inquiry will be, where is such a variety to be met with? and the answer at present (I fear) will be, nowhere! But if the skill of some of our horticultural experimentalists were directed to the matter, is there not reason to hope that such a variety might be obtained? If the Royal Agricultural Society could procure such a one by offering a reward of 500*l.* for it, it would be the best spent money that ever passed through their hands. The value of Wheat is about five times that of the same weight of straw, and yet, probably, 95 per cent. of its weight is composed of exactly the same elements—if then we could procure a variety which instead of two tons of straw and one ton of Wheat, would produce a ton and a half of each, the crop would be amazingly increased in value. Is not this possible? and if it be, is it not worth trying for? Certainly the relative weights of straw and grain vary in every parish and every season, more or less; and it seems to be very desirable to increase the former, even if it can be accomplished, at the expense of the latter; and so far am I from desiring (as some people do) to have a Wheat which produces more straw, that I think the endeavour ought to be to discover one which produced only half the straw, in the hope that good cultivation would enable us to produce from it twice the quantity of grain. Piper's Thickset, for instance, is perhaps the shortest strawed Wheat grown in England, but is rather coarse in the grain. Now, if by crossing it with a fine thin-skinned sort we could obtain a variety shorter in the straw than Piper's, and equal in quality to the other, our object would be attained, provided the new sort grew proportionately larger in the head. But may not the tendency to improvement in the size of the head be considerably increased and accelerated by careful management? In the *Gardeners' Chronicle* some years back a correspondent recorded the result of an experiment of the kind, which deserves attention. He took the pod of a garden Bean, in which he found five seeds; he sowed these, and in the produce some of the pods contained five seeds; he sowed these, and some of the pods contained six seeds; he sowed these, and some of the pods contained seven Beans, and thus by careful selection he at last obtained a variety, the pods of which almost all contained seven Beans. Might not a careful selection of large ears of Wheat for seed, continued for some years, produce heads very much larger than the original stock. Has not such careful attention and selection in all instances, both animal and vegetable, produced a marked improvement in the breed or variety? If some expert manipulator would turn his attention to hybridising Wheat instead of Fuchsias, he might probably obtain a variety which would make his fortune as well as that of all the farmers who sowed it. Certainly if I could manage the operation I would not fail to try it every year as long as my life was spared, or till I succeeded in obtaining a variety to my mind; but I fear the stigma is so difficult to get at, as well as the stamens, before flowering, that a person who, like myself, is not much accustomed to such operations, would have little chance of success. Can you give any instructions on the subject? My present plan (for I have been trying it for some years) is to sow two kinds in drills alongside each other, and then sow the produce; by this means I have procured several varieties, but none better than the old ones. Something may be also done by acclimatising, or rather by sowing a Wheat which has been acclimatised in a much warmer country. Some years ago I sowed a fine white Wheat, which was the produce of some Wheat from Australia; that Wheat was in flower in May at Clitheroe, which I attributed to the Wheat having been cultivated some years in a climate where it had grown and ripened in a much shorter time than Wheats do in this country, and that its time of ripening had by this been much accelerated. *T. G.* [The process of hybridising is not so difficult:—care must be taken to remove the stamens from the flower selected for the experiment before the anthers have burst.]

* The term steward in England means land-agent in Ireland, and the term bailiff in England means steward in Ireland, where the term bailiff is one not only of reproach but of execration, no matter how necessary such an officer may be.

Societies.

LENHAM, KENT: *The Hop Fungus.*—DR. PLOMLEY said he felt most happy in being able to state very briefly his observations on fungi generally, but more especially that to which they referred, viz., the Hop fungus or mould. For the last year and a half he had paid great attention to this subject, and he found that in order to understand the nature of the Hop fungus, it was necessary to investigate the whole class of moulds, before any definite and satisfactory conclusion could be arrived at as to its causes and remedy. As far as the farmer was concerned, fungi might be divided into two classes, viz. those which existed in the substance of the plant, and those which lived on the surface: bunt, smut, mildew, &c., were internal moulds; the Hop mould, and also those which attacked Peas, Beans, Turnips, &c., were external or superficial—they did not enter into the substance of the plants upon which they grew. Now, these external moulds could all be destroyed by the application of sulphur. In some experiments which he made last year, with sulphur, on the Hop mould, he found that in but one case out of 20 was the first application effectual, but that it required generally

frequent applications; this year the result of other experiments had been that the application of sulphur to the Grape and other fruit trees might be easily effected, but it was not so easy a matter to apply it to the Hop. The application of sulphur for the cure of mould on trees and shrubs had been known for many years. The Rev. Mr. Berkeley he thought mentioned it in the *Agricultural Gazette* in 1846, and it had been tried all over Europe; and it was but fair to say that its application in these cases had for the most part been attended with satisfactory and beneficial results. The great difficulty he conceived that would be experienced in its application to the Hop plant, would be the great number of applications necessary to keep the fungus in check. In seasons like the past, with a small amount of solar heat, and considerable moisture, the sulphur would probably have to be applied nearly every day, otherwise they could not hope to obtain any benefit, nor to keep the mould under. No one denied the power of sulphur, and he for one believed it to be very efficacious. They should not however be too sanguine. Last year one of the first entomologists of this country, Rev. Mr. Spence, of whom he doubted not they had all heard, writing on the subject of the Hop fly, gave it as his advice, that as the insect originated in the Sloe trees, and migrated from them to the Hop plant, the only remedy to destroy the insects would be to destroy the Sloe trees. Since he (Dr. P.) had turned his attention to the peculiar habits of these insects (which he had done with especial reference to some disputed points in his own profession) he was of opinion that if they deprived these insects of their winter quarter, the Sloe bushes, they would immediately go to the Plum and other allied species of trees. Another naturalist of high repute, who suspected that these insects laid their eggs on the Hop bine and on the Hop poles, strongly recommended that the Hop poles and the Hop plant should be destroyed every year. (Laughter.) He mentioned these as instances to show that what at first sight might appear very plausible, and apparently likely to be attended with good, when examined into and applied, frequently turned out to be a failure. But the occasional mistakes of scientific men ought not to throw a cloud over all their suggestions, many of which were most excellent, and would be found extremely beneficial when applied to agriculture. There was no branch of science which might not be brought to bear on the soil: and although the application of sulphur might turn out to be a failure, yet he would advise them to turn their attention to the subject, and see how far it might be made applicable to their purpose. He trusted that in the observations he had made he had said nothing that would tend to discourage or wound the feelings of those who were interesting themselves in the application of sulphur as a remedy for the Hop mould. He (Dr. P.) believed Mr. Epps' machine to be the most perfect instrument yet invented for applying sulphur, and when conjoined with Mr. Wykeham Martin's apparatus for confining that substance, would be found as efficacious as instruments could be. He had thought it his duty, being called upon by their chairman, to state the result of his observations, and also to tell them what his opinions really were on the matter. He had prepared a large microscopic view of the various stages of the Hop fungus, drawn by Mr. Brett, jun., which had been considered worthy to be sent to the Exhibition of 1851. The uses of these fungi or moulds in the economy of nature were to assist in the decomposition of dead or decaying substances, and that he believed they never made their attacks upon healthy plants at all, but as soon as a plant became in the least unhealthy from whatsoever cause (probably from atmospheric) they then stepped in to begin the duties they had to perform, and that though sulphur would certainly be most efficacious when the mould first showed itself, yet if the morbid state of the plant continued, he was of opinion it could not thus be prevented, except by very frequent, perhaps daily applications. He did not think that the mould spread from plant to plant, the same causes that produced it in one plant produced it also in another, and that the application of sulphur, except constantly or frequently applied, would not prevent the spread of the fungi.—The Chairman then proposed the health of Dr. Plomley, with thanks to him for the very interesting explanation he had given of the Hop fungus, an explanation from which he had derived more information than he should have hoped to obtain from a thousand books on the subject, and which he was sure they would all feel indebted to that gentleman for.

Dr. Plomley, in returning thanks, assured the meeting that he felt the greatest interest in the advancement of agriculture, for the same principles were involved in its practice as in that of his own profession. They had all, said Dr. P., in their several departments to do with matter in some shape or another, and they who understand most of its laws were sure to be the most successful. In whatever department of industry they might be engaged, matter was the raw material supplied to them by nature, from which their crops are obtained, and from which man obtained his wants and gathered his luxuries. They could produce no effect upon this matter, nor even know its capabilities, except they knew the laws which regulated it, an acquaintance with which laws was called science. All the improvements in the manufactures, in fact in all the industrial arts have arisen, from knowledge of the laws of matter, called science. The application of chemical science to the simple and low art of match making has raised it to one of our most profitable manufactures; several thousands of human beings are employed in making lucifer matches, one manufactory alone consuming in their production 400 logs of wood yearly. To science we are indebted for the present eminence and position of all our manufactures, and it is a question whether, by the same science, the farmer might not be able to manufacture food for the people in much greater quantities than he has hitherto done. He (Dr. P.) believed that by the aid of science, by economising time and labour, that it was possible to increase the agricultural produce of this country to a greater extent, indeed it might be increased ten-fold. (This startling announcement was received by cries of "No, no, no, no.") Yes, he would state this to be the minimum of its possible increase. He would tell them why they would increase the amount of their produce, because it appeared to him, they would be obliged to do so. Hitherto they had been able to keep pace with the increase of population pretty well, and population never increased faster than the means of subsistence, but population was now pressing hard upon them, it was increasing with great rapidity, and as a natural consequence the farmer would be compelled to increase the produce of his land. (Hear hear.) Men know not what they can do until they are forced to trial. Some 50 or 60 years ago, we would not manufacture our own iron, because we did not understand the process of smelting, though we possessed the largest mines of iron in the world, and also the limestone necessary for reducing the ore. We obtained our iron from Norway. War came and stopped our supplies, we were obliged immediately to look to our own resources, and by the aid of science, see now the result, more extensive than all the mines of the world put together. Again, by war, the French were cut off from obtaining kelp and barilla, substances essential for the manufacture of soap and glass, they were obliged to resort to the science of chemistry, and by its aid they discovered the process of obtaining soda from common salt (the greatest and most important discovery of this age, and without which our manufactures, notwithstanding the steam-machinery, would not have existed), by this they manufactured soap and glass more readily and at less cost than with barilla and kelp. The same with sugar, when their supplies were cut off they produced it from Beet-root. So it is with farmers, they knew not what they could do until they tried, and this trial must undoubtedly come. The farmer may have some disadvantages, perhaps many, but he has advantages which those of other countries have not. The farmer has to do with living things, and thus he required more science than all the rest put together. Farming claims kindred with the whole range of physical science, and in this country the farmers can command this, for all are willing to assist him, the geologist, the chemist, the botanist, the meteorologist, &c., are all labouring to place their respective sciences at his service, if he would but avail himself of their discoveries. There are thousands of scientific truths at this moment ready for the farmer, the application of which will be to his advantage and to the advantage of the country. Not, said Dr. P., to take up too much time, I will endeavour to concentrate in a few words the means by which the farmer may increase his productions. Let an honourable emulation arise among you—wean yourselves from that tenacious attachment that you now have to the routine practice of your forefathers. Look with less distrust and suspicion, on change and innovation; avail yourselves of the advantages offered to you by science, and look at science as your principal aid, as do the manufacturers; and throw aside that morbid feeling that your own modes of culture are superior to those of others, and imp ovements in agriculture will follow, that will astonish you and all the world beside. It is said that the British farmer lies under great disadvantages; now, he could never see what their disadvantages were. They had the best climate in the world. (No, no, and hear, hear.) They had the best soil in the world for the growth of those plants which produced the most nutritive food. They could not grow cotton, Indian corn, indigo, or tobacco, but they could grow Flax, Wheat, and other cereals, also Turnips and other roots, and grow them far better than they could be grown in any other part of the world. (No, no.) They could and did grow Wheat in greater quantity and of better quality than any other nation. (No, no, and hear, hear.) Better than that grown in the rich valleys of the Mississippi or in southern Russia, or in Spain, or even in Italy. I speak decidedly on this point, having chemically examined the various Wheats, as to their nutritive value, and I say that corn grown in this country is more nutritious than corn grown in any other part of the world, not even excepting that grown in Italy, from which maccaroni is made. It was true that foreign corn did fetch a higher price in the market, than did that of home growth. But why was that; the reason was that foreign Wheat contained more of that non-nutritious stuff, starch, and passed through the mill easier, thus giving a greater advantage to the miller. But the advantage was not confined to the miller, the baker received still greater advantages, for this starch absorbed more water than the flour of this country. So that although foreign corn fetched a higher price in the market on account of the personal advantages of the baker and miller, it was of less nutritive value than that of English growth. And from the experiments he had made on the subject, he could most decidedly tell them that the corn grown in this country was of more real value than that imported from any other country in the world. (Loud cheers.) There were o her advantages which the British farmer possessed over the farmers of other countries. They had roads and railroads for transmitting their produce to the towns with the least possible delay and expense. They had good and liberal landlords; this was a great advantage. The landlords of this country were as a class ever willing to lay out any amount of money, in improvements for their tenants, and that too at a very moderate interest. The farmers of no other country possessed the advantage of their landlord's capital. (Hear, hear.) Then again with regard to the labour, they had their work done at the lowest possible price, and could command hundreds of labourers when required, and discharge them when not wanted. Was not this an advantge which no other country possessed; again, as he had before stated, they had the assistance of all the scientific men of the day, who were willing to assist and encourage them in their arduous and trying occupations, and for himself, he assured them, that he should feel the greatest possible pleasure in rendering his humble abilities to their service. (Cheers.) He said, he thought the English farmers were in a better position than those of other countries, and that they had, with all their disadvantages, advantages which no other country possessed. He advised them not to despair, but put their shoulders to the wheel, and exert themselves to their utmost, not to be led away by political promises, but endeavour to improve the cultivation of their farms. In conclusion, he trusted he should be permitted to propose a toast. It was an old one, one of the olden time:

"The spade, the fleece, and the pail;
May landlords ever flourish, and tenants never fail."

Mr. Geo. Powell said he rose not for the purpose of making any political allusions, or of remarking upon what had fallen from the preceding gentlemen, but rather with the intention to offer a challenge It had been almost said that the agriculturist of this country was inferior to any other class. Now, the exhibition of 1851 was approaching, it was near at hand, and he had not the least hesitation in saying that the agriculturists of this country would there stand in pre-eminence, before those of other nations, while our manufacturers would have everything to learn from the foreigner. (Cheers.)—The Chairman said he was much obliged to Dr. Plomley for the observations he had made, which satisfied him that although he was a scientific man, he knew but little with regard to farming. (Laughter and cheers.) However, he had spoken honestly and conscientiously, and had in his remarks told him (Sir E.) something which he had not known before, viz., that it was not always to the price which an article obtained in the market that they were to look for its real value. In this respect, as in many others, Dr. Plomley's remarks were extremely useful, and he was sure they must all feel deeply indebted to him for them. (Cheers.) The Chairman then proposed "The Press," which was responded to by Mr. Hall and Mr. Phippen. After wishing them all good night and success to their next merry meeting, the Chairman left the room and the party broke up, having spent a most pleasant evening.

Calendar of Operations.

OCTOBER AND NOVEMBER.

Central Yorkshire, *Oct* 31.—After some years' experience of the dairy and sheep farming of Dorsetshire, it has been my luck to emigrate thus far North, and commence a fresh noviciate on the farm of Mr. Hannam, at Kirk Deighton. As the change from Downs and Devons to Leicesters and short-horns is not more striking than the change of system of farm management which the change of locality has presented to my notice, it has struck me that the record, which it is my intention to make of the practices that it is now my especial province to observe and study, may furnish you monthly or weekly, as the case may happen, with a few notes of farm practice and routine work, that may be acceptable for the purpose of comparison with those of other localities, by parties who take an interest in such matters. Having only left my native county about the middle of October, my observations upon the doings of this month are necessarily imperfect and general. Mr. Hannam's farm is about 450 acres, 250 of which are arable and 200 Grass, capable of grazing a bullock of 40 to 50 stones. The Grass land is strictly devoted to feeding cattle, horses being fed in yards in summer, sheep upon seeds and Clover, &c.; and no calves are now bred, or dairy stock kept, except for family use. The depreciation of price of lean and young stock enables the grazier to buy at a lower figure than he can breed. The principal portion of the summer fed cattle are now sold. There are, however, 30 upon the aftermath, and 25 bullocks and heifers are now tied up, and are doing well upon Turnips and chaff *ad libitum*, and 7 lbs. of oilcake each per diem. Forty lean heifers are already bought in, to run over the old pastures, and consume straw in the yards during the winter. These heifers, by being well kept and sheltered, I am told, will come out fat from the pasture very early—say end of July, and frequently fetch a better price than those which are fat later in the summer. *The Sheep Stock* is now upon Turnips, Rape, &c., viz., 112 Leicester ewes and 250 hogs and fat sheep. For the feeding sheep Gardner's cutter is used from the commencement of the season. The ewes have had a month's Rape previous to being put to ram a fortnight ago. About a dozen shearling rams bred by Mr. Hannam have been sold off during the last month at fair prices. *Pigs.*—The stock of pigs is very large, and I need not add also good, as Mr. H.'s repute as a breeder of first-class animals of the celebrated Yorkshire breed is well known. Mr. H. buys foreign Barley to a considerable extent for this stock, as his own Barley is generally of first-rate quality for malting. One thousand bushels of Barley, &c., were consumed last year by pigs, &c., in the manure yards. Sows have finished farrowing for this season, and stores and porkers are now put up to feed upon steamed food, prepared by a very convenient apparatus manufactured by Richmond and Chandler, Manchester. *Arable Land,*—The arable land is of two sorts—one-half thin, hungry, magnesian limestone; the other strong loam and sand. One hundred acres of this has been thoroughly drained by Mr. H.; and several miles of fences have been stubbed and trees eradicated. The enclosures now run from 10 to 20 acres, and have low hedges, which are plashed twice a year. The system adopted is the alternate one of green and grain crop. Upon the limestone the green crop is consumed upon the land with oilcake or grain. Upon the stronger soil a portion of the green crop is mown, and half the Turnips, &c., are consumed in the yards. The whole of the manure made by horses, pigs, and feeding and store cattle consuming roots, corn, and cake, is applied to green crops—Turnips, young seeds, and Clovers; 10 to 16 carts, 2 cwt. of guano, and 2 bushels of dissolved bones, per acre, for Swedes; and 10 carts and 2 cwt. of guano for white Turnips. For grain crops, on the limestone land, 2 cwt. of guano is added for Wheat upon seeds, after the seeds have been depastured; and also for Barley, where Turnips are eaten on the same dressing. On the stronger land, when the green crop is taken off, 3 cwt. of guano is used; and, when consumed on the land, 2 cwt. of guano is used for the next crop of Barley or Wheat. *Work of the Month.*—The weather has been most propitious since harvest for farm work. Six acres of Rye and Tares for early seed for sheep; 2 acres of early Tares for mowing have been sown five or six weeks upon Wheat stubble, and will be followed by white Turnips; 20 acres of stubble for Swedes, Potatoes, &c., have been ploughed thin, harrowed, dragged, and cleaned of Couch Grass in the interval between harvest and seed time. Potatoes have been harvested. The white Potatoes (Regents) are comparatively sound; the red (Irish cups) are much diseased. Wheat sowing is all over. The poor limestone it is usual to sow about this time, and after rain has consolidated the thin arid soil. 60 acres of pastured seeds and Clover stubble have been ploughed and furrow-pressed by four ploughs, made by Busby, and two two-row pressers, by Crosskill, which do the work in a beautiful manner, and shine, especially in comparison with other pressers of village make. This mode of preparing the seed-bed makes an even, level, and solid root-hold for the plant, ensures even germination, and prevents, on light soils, the roots from being turned out by the frost; for this cause it is preferred to drilling. 10 acres of Potato and Rape land have also been sown with Wheat. Six tons of guano have been employed upon the Wheat crop, all being dressed except one field of good land (7 acres) which was seed pasture of great luxuriance, and 2½ bushels of seed per acre have been sown. Very little threshing, except for seed, has been done yet upon the farm, the straw being reserved for winter. The crops here have been much damaged by wind, hence the yield is said to be deficient. Manure-making is now beginning in earnest since cattle have come into the houses. The buildings are all spouted with iron, and no waste from washing occurs, the surplus liquid running into a tank, whence it is pumped over the manure-heap, which consequently never requires turning upon the Couch, or after it is carted out. The excess of liquid is carted out at proper seasons, and when not wanted for this purpose, runs by a drain at the top of the tank into a large shallow pit or excavation, where weeds, earth, and rubbish of all sorts are thrown. In this there is a mass of stubble, weeds, animal matter, sawdust, hedge-clippings, Thistles, Nettles, &c., at present, which, by the action of the liquid upon them, have become since harvest a dark, unctuous, and rich manure. Mr. H. calculates to make at least 100 loads of manure each winter from these waste materials, by the aid of the tank and this catchpit. Seven acres of meadow land and 5 acres of pasture have been manured this season already. Team-work — of which we have this month had, carting Potatoes, Turnips, guano, oilcake, &c.—is done on the single-horse cart system; Crosskill's are used, and pair-horse ploughs only. Boys are employed to plough, and, certainly, under the eye of the foreman and first ploughman (such is the use of first-rate implements) they make most excellent work. All the ploughs being set to one depth and width of furrow, when the ridge is set by the foreman, the work of one plough cannot be distinguished from that of another. A boy 14 years old and a pair of horses is a different cost from two men and four or five horses, which we see in many districts engaged upon the operation. *Labourers.*—It has struck me that the workmen of this county are superior in skill to those we generally meet with in the south. Neatness and quickness in their work (witness ploughing, thatching, stacking, &c.) seems a characteristic; hence their higher rate of wages is not all loss to the northern farmer. Steady hands are well employed here, though wages, I am told, are lower than before recent legislative changes—10*s.* and 11*s.* per week is paid now, where 12*s.* and 14*s.* were usually the wages per week. What will our cider drinkers say to the fact that a dozen male labourers and servants employed on this farm do not spend on the average 3*d.* per week each in ale or other liquor. Nor is any liquor allowed them during work, except in harvest and hay-time, and then only from two to three pints a day. Women are very industrious in field work; they are employed now in barn-work,

pulling and cleaning Turnips, &c.—wages 8*d.* and 10*d.*, and for Potato gathering, 1*s.* per diem. *J. S.*

DORSET FARM, *Nov.* 11.—Since last report we have had very fine weather, and now Wheat sowing is nearly done, and the first sowings are up and looking extremely well. Vetches and other winter green crops are also promising well, and the pastures are still growing, and late Turnips will be a good crop, as well as the early sorts. Our sheep are all eating Turnips, being folded on the ground after two-thirds of the roots are carried off for the cattle. We do not carry off the tops, but cut them off, as well as the fibrous roots, on the land, and the sheep, coming after, eat all up. We have still a little Wheat to sow after Turnips and also after Mangold; but we shall not think ourselves too late if we have in all our winter Wheat this month, and then we shall sow a little spring Wheat after that. We are still storing Mangold, of which we grow about 21 acres; some we put in a house, and the rest lie in a line, about 7 feet wide and as high as they will lie on themselves without any support, and then we cover them with loose straw, and after that thatch them with Wheat-straw, which is tied up as it comes from the machine, which sends the straw out as straight as when it is put in, and saves a good deal of labour in preparing thatch. We have sometimes set up hurdles, 6 feet apart, and stored the Mangold between them, but we have found them keep as well in a single heap, and are also less expensive to secure. We have sometimes had the tops cut off when we took them up, but as they are often cut too close, which causes the root to rot, we have them all twisted off now. Our work is ploughing for Wheat when we have the Turnips off, and ploughing and otherwise preparing the land for next root-crop, and driving out dung and collecting other materials for manure. *G. S.*

LAMMERMUIR SHEEP FARM, *Nov.* 5.—The month of October, though seasonably good, has, especially towards the end, reminded us of the near approach of winter. The bathing of the sheep, which we expect to finish this day, has kept our shepherds very busy during the past fortnight. The bath we use is a preparation of rough turpentine, grease, butter, and some *et ceteras*, the names of which the maker keeps to himself. When poured upon the sheep, it is very much of the consistency and colour of butter-milk. It has this advantage over most bathing and dipping preparations, that, besides killing all vermin, keeping the wool very white, and materially increasing the weight, it does not readily wash off by heavy rains coming immediately after the sheep have been bathed, and before the preparation has had time fully to perform its duties. Our next work will be, putting jackets upon the hogs. As these graze among the ewes, this must be finished before the 22d prox., to prevent all unnecessary disturbance after the tups are put to the ewes at that date. The rams are at present confined in a small inclosure, where they daily receive as many Turnips as they can eat. Our cast sheep are now all disposed of and away. Hill stock, in the Lammermuirs, generally are in excellent condition at this date—above an average, we would say. This is the result of the past fine summer. Our wet hills always graze best in a dry season. Ploughing of Oat-stubbles for Turnips is half finished. Any summer-made manure has been carted to, and spread on these previous to being ploughed. The cows and calving heifers receive Oat-straw at night, and are let out to Grass during the day. The calves are getting Turnips at night. The Oats at present being threshed out, are made into meal for the shepherds, whose wages are paid at this time. *A Lammermuir Farmer.*

Notices to Correspondents.

BONES: *J G.* You must crush them in a mill for the purpose, before adding sulphuric acid; and then a few weeks before using them in the land, lay them down on a floor of clay, surrounded with a clay rim, and wet them thoroughly with water, then pour over them about one-third their weight of sulphuric acid, stir about and put up the heap, and cover it over with dry turf ashes, and leave it for a fortnight, then break down the heap, and mix with the ashes.

CAPITAL: *E T.* See Schemes of Cultivation for Small Farms, at pages 9, 58, 290, 311, 361, 830, in our volume for 1847. The scheme at p. 311 will perhaps the nearest meet your circumstances; the capital indicated is 10*l.* 10*s.* per acre. Fuller, hereafter.

CATTLE: *Constant Reader.* Give them a mouthful of hay the first thing till the Turnips are cut, then give them 40 lbs. of Turnips each. At 10 A.M., give them half their chaff and Linseed, say 4 or 5 lbs. of chaff, with 2 lbs. of Bean-meal, and 1 lb. of Linseed. At 1 P.M, give them 30 lbs. of Turnips, at 4 another quantity of chaff with meal, and at 6 or 7, 40 or 50 lbs. of cut Turnips.

CATTLE ATTACKED WITH DISEASE IN THE LUNGS: *Constant Reader.* Moderate bleeding, powerful blisters to the sides, with setons in the brisket, and strong sedatives internally. The treatment of plero-pneumonia is given in a former Number of this Paper. We are not aware of any work that particularly treats of the disease, but there have been several essays on the disease in the Journal of the Royal Agricultural Society of England. *W. C. S.*

CATTLE PUMPKINS: *An Old Subscriber* has a quantity, and wishes to know how to preserve it from frost, and how to use it as food for cattle or sheep. We are entirely unacquainted with it.

CHURN: *Sylvanus.* The American Churns are made large enough for 20 lbs. of butter, we believe: they are certainly economical of time. The common barrel churn gives as satisfactory an agitation to the cream as any, and for large quantities of butter we should employ it.

COARSE GRASS: *Este.* It will be improved by a heavy dressing of wood-ashes. Salt may be an improvement also, and 2 cwt. per acre wherever the land is heavy, up to 4 or 5 cwt. per acre on light soils, are a reasonable application. Apply these manures in February or March. If you sow Clover seed you must dress the land heavily with some earthen compost first, and harrow heavily. As regards your gravelly subsoil, we suppose the main drain will be safe enough at 5 feet deep, both from elm roots and from slips in the gravel, provided the tiles be laid properly at first.

COMMON LAND: *J F.* Plough one half of it now, and sow it to Oats in spring. Break up the other half in February and March by paring and burning, and you will be able to bring it to a fine enough tilth for Turnips, part of which you may feed off, and part carry for cattle in boxes or stalls to be littered and fed with the Oat straw and them; and so you get at once into the system of alternate husbandry. T. Keir Short has a sixpenny book on the cultivation of Flax. Apply to any bookseller.

DRILL: *W D C.* A number of small drills for sowing either Turnips, corn, or Mangold Wurzel seeds are in existence. They are all upon the principle of the home made drill recommended at page 589, 1849, by Mr. Tuckett.

FARM HORSES: *G S.* Keeping them in stables answers best for ordinary farm work. Where there is a great deal of hauling and night work, as there is on farms near London, to keep them in yards has been found to answer well.

FOOD FOR SHEEP: *A Subscriber.* Peas, Beans, Barley, oilcake, and Oats. Commence with half a pint, or less, of the former, or half a pound of oil-cake, and increase up to as much as 3 quarters of a pound of any of them. They are named in the order of their excellence in our estimation.

GUANO ADVERTISED AT 5*l.* PER TON: *A Subscriber, but not a Farmer.* "Company's Guano (concentrated) 5*l.* per ton; ditto ditto, 2d quality, 3*l.* per ton." All we can say is—Don't buy them.

IMPROVEMENT OF CHALK SOILS: *W C J.* In some localities, to chalk down land is an improvement, in others it is not. And so it is probable that the result is owing to the presence or absence of some element, such as phosphorus, in the chalk added, which could be applied more cheaply otherwise. If your land is very light, and you have a chalk marl at hand, a dressing of that previous to the application of guano might be beneficial. For a crop of Swedes, try guano and superphosphate. Feed them off on thin land with sheep; that is the best plan of improvement.

LIME: *J B B.* Apply about 5 tons of lime shells per imperial acre now, letting them slake first, and then spreading them and ploughing them in with a shallow furrow.

LINSEED: *R M.* Boil 2 lbs. in a gallon of water, and throw it over the hay chaff the cow is to eat. Mr. Rogers' peat-charcoal is to be had in London, we believe; he should advertise if he wishes it sold.

MANURES FOR WHEAT: *R S.* We have to apologise for the delay of this answer. We would add the turf ashes and the Rape-cake in autumn, and apply the guano in spring. 32*s.* per acre will purchase rather more than 2 cwt. of the former and 2 cwt. of the latter per acre, and that is the way in which we should spend it.

MARSH PLANTS: *W D C* We may possibly assist you by publishing your question: Can any one name any edible root, pulse, or Grass which will grow well on a strip of land lying by the side of a river, and frequently overflowed?

MILDEW: *E S Power.* The specimen of Wheat in the straw with which you have favoured us has suffered from the common form of mildew, which is apt to appear on late crops in moist seasons. The only remedies are such good cultivation and early sowing as will hasten harvest time. Anything which tends to a luxuriant growth of straw, such as rich putrescent manures and moist weather, as it delays the ripening of the crop, increases the chance of injury by mildew; anything which hastens harvest time diminishes this chance. It might be well to change the seed; and the application of common salt as a top dressing in spring at the rate of 2 to 3 cwt. per imperial acre, is said to be a good thing.

PEAT CHARCOAL: *A Subscriber.* Apply to any bookseller for Mr. Jasper Rogers' pamphlet. Some of his pamphlets are published by Effingham Wilson, 11, Royal Exchange, London.

PIGEONS: *P T O.* A work on birds, in which domestic pigeons are to be comprised, is likely to be published soon by Mr. Murray. We cannot, of course, forestall here any information that it may contain.

SHIELDRAKES: *Chanticleer.* We do not quite understand what you mean by young shieldrakes in November. There are now the adult birds and the birds of the year, but none which a breeder of water-fowl would call "the young" as your question seems to imply. Chopped mutton or beef in moderation will do them no harm; bullock's liver is often convenient to give to birds which require animal food; but let the gardener's boy try what supply he can afford, by digging for earth-worms and searching for snails.

STEAM BOILER, &c.: *Tyro.* Apply to Messrs. Richmond and Chandler, Salford.

*** Communications reaching town after Wednesday cannot be answered till the following week.

Markets.

COVENT GARDEN, Nov. 16.

Vegetables are abundantly supplied, and so are Hothouse Grapes. Pine-apples are scarcer. Oranges and Lemons are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. Mushrooms are still dear. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Fuchsias, Mignonette, Verbenas, Dahlias, Bignonia venusta, Stephanotis floribunda, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4*s* to 6*s*	Lemons, per doz., 1*s* to 2*s*
Grapes, hothouse, p. lb., 2*s* to 5*s*	Pommegranates, each, 3*d* to 6*d*
— Portugal, p. lb., 8*d* to 1*s*	Almonds, per peck, 6*s*
Plums, p. punnet, 1*s* to 2*s* 6*d*	— sweet, per lb., 2*s* to 3*s*
Pears, per doz., 1*s* to 3*s*	Walnuts, p. 100, 1*s* to 2*s*
— per half sieve, 6*s* to 15*s*	— p. bush., 12*s* to 24*s*
Apples, dessert, p. bsh, 3*s* 6*d* to 8*s*	Nuts, Barcelona, p. bush., 20*s* to 22*s*
— kitchen, do., 3*s* 6*d* to 6*s*	— Brazil, p. bsh., 12*s* to 14*s*
Oranges, per doz., 9*d* to 2*s*	Filberts, per 100 lbs., 60*s* to 65*s*
— per 100, 6*s* to 10*s*	

VEGETABLES.

Brussels Sprouts, per hf. sieve, 1*s* 6*d* to 2*s*	Shallots, per lb., 6*d* to 8*d*
Cabbages, per doz., 6*d* to 1*s*	Garlic, per lb., 4*d* to 8*d*
Greens, p. doz. bun., 1*s* 6*d* to 2*s* 6*d*	Artichokes, Jerusalem, p. half sieve, 1*s* 6*d* to 2*s*
Cauliflowers, p. doz., 1*s* to 4*s*	Lettuce, Cabbage, p. score, 1*s*
Sorrel, p. hf. sieve, 6*d* to 9*d*	— Cos, p. score, 6*d* to 1*s* 6*d*
Potatoes, per ton, 50*s* to 80*s*	Endive, per score, 1*s* to 1*s* 6*d*
— per cwt., 2*s* 6*d* to 4*s*	Small Salads, p. punn, 2*d* to 3*d*
— per bush., 1*s* 6*d* to 2*s* 6*d*	Horse Radish, p. bdl., 1*s* to 4*s*
Turnips, p. 12 bundles, 1*s* to 2*s*	Mushrooms, p. pot., 1*s* to 2*s* 6*d*
Red Beet, per doz., 6*d* to 1*s*	— per bushel, 5*s* to 7*s*
Cucumbers, each, 6*d* to 1*s*	Fennel, per bunch, 2*d* to 3*d*
Radishes, per doz., 1*s* to 1*s* 6*d*	Savory, per bunch, 2*d* to 3*d*
Leeks, per bunch, 1*d* to 2*d*	Thyme, per bunch, 2*d* to 3*d*
Celery, p. bundle, 9*d* to 1*s* 6*d*	Parsley, p. doz. bun., 1*s* to 2*s*
Carrots, per doz., 2*s* to 5*s*	— Roots, p. bdle., 9*d* to 1*s*
Tomatoes, p. punnet, 6*d* to 1*s*	Marjoram, per bunch, 2*d* to 4*d*
Spinach, p. half sieve, 6*d* to 1*s*	Mint, per bunch, 2*d*
Onions, p. bunch, 4*d* to 6*d*	Watercress, p. 12 bunch., 6*d* to 9*d*
— Spanish, p. doz., 1*s* 6*d* to 4*s*	

HOPS.—FRIDAY, Nov. 15.

Messrs. PATTENDEN and SMITH report that fine coloured Hops continue in demand at full prices; inferior sorts not so much sought after.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, Nov. 14.

SMITHFIELD, MONDAY, Nov. 11.

There is a considerable falling off in the supply of Beasts, and, in consequence, trade is better for all kinds. A few choice things have nearly reached 4*s.* The number of Sheep is very small, so also is the demand; however, on the average, better prices are realised. Trade is better for Calves, the number being small. From Holland and Germany we have 797 Beasts, 4180 Sheep, 96 Calves, and 60 Pigs; from Scotland, 100 Beasts; and 2300 from the northern and midland counties.

Per st. of 8 lbs.—	*s*	*d*	*s*	*d*
Best Scots, Herefords, &c. ...	3	8 to 3	10	
Best Short-horns	3	6 — 3	8	
2d quality Beasts	2	8 — 3	2	
Best Downs and Half-breds ...	3	10 — 4	2

Ewes & 2d quality	2	8 — 3	2	
Ditto Shorn	—	...		
Lambs	—	...		
Calves	2	8 — 3	10	
Pigs	3	0 — 4	0	

Beasts, 3744; Sheep and Lambs, 25,540; Calves, 149; Pigs, 380.

FRIDAY, Nov. 15.

The number of Beasts is a fair average; good ones are fully as much in demand as on Monday; indeed, many of the choicest make 4*s.* A tolerable clearance is effected. The supply of Sheep, although not large, is about as usual this time of year; the demand is not large, and quotations remain unaltered. Calves are a more cheerful trade, and we are enabled to make 4*s.* of a choice one. From Holland and Germany there are 448 Beasts, 850 Sheep, 118 Calves, and 15 Pigs; 350 Beasts from the northern and midland; and 92 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3	8 to 4	5	Best Long-wools .	3	6 to 3	8
Best Short-horns	3	6 — 3	8	Ditto Shorn	—	...

Ditto Shorn	—	...		Lambs	—	...	
				Calves	3	0 — 4	0
				Pigs	3	0 — 4	0

Beasts, 1034; Sheep and Lambs, 4700; Calves, 251; Pigs, 480.

COAL MARKET.—FRIDAY, Nov. 15.

Eden Main, 15*s.* 6*d.*; Wallsend Haswell, 16*s.* 3*d.*; Wallsend Lambton, 16*s.* 9*d.*; Wallsend Stewart's, 16*s.*: Wallsend Tees, 16*s.*—Ships at market, 172.

POTATOES.—SOUTHWARK, Nov. 11.

The Committee report that the market is well supplied from Yorkshire and Scotland, but nothing from the Continent; trade is heavy, which has compelled salesmen to accept of our lowest quotations in some instances, as it is only with some few superior lots the highest quotations have been realised. Present prices:—York Regents, per ton, 70*s.* to 80*s.*; Scotch do., 50*s.* to 60*s.*; Wisbeach and Cambridgeshire do., 60*s.* to 65*s.*

MARK LANE.

MONDAY, Nov. 11.—The supply of English Wheat by landcarriage samples to this morning's market was again small, which enabled factors to realise at the terms of this day se'nnight. Foreign met a more general demand, and a fair business was done at Friday's prices.—Fine malting Barley meets a good inquiry at an improvement of 1*s.* per qr.; late prices are also more freely paid for grinding and foreign qualities.—In the value of Beans there is no alteration.—White Peas are rather more inquired after and the turn dearer; other descriptions are unaltered.—Oats meet an improved demand, at rather better prices.

FRIDAY, Nov. 15.—The arrivals of all grain since Monday have been moderate. To-day's market was fairly attended, and more disposition to purchase Wheat was general, at prices which of late were unobtainable.—Malting and distilling Barley is in demand, at an advance of 1*s.* per qr.; grinding the turn dearer.—Peas and Beans are fully as dear.—Oats are a free sale, at an advance of 6*d.* per qr.—Flour meets an improved inquiry at our quotations.—Floating cargoes of Wheat have been less freely taken at late prices, but the demand improved at the close.

ARRIVALS THIS WEEK.

LIVERPOOL, FRIDAY, Nov. 8.—We have had few arrivals of English, Irish, or foreign grain since our last report; but of Flour, from the American States and Canada, the import is again liberal. At our market this morning the trade for Wheat of all descriptions manifested the same languid appearance as of late; of course the transactions were very inconsiderable, and the last quotations hardly sustained. Flour was the most attractive article of sale, and met a fair demand. Barley, Malt, Beans, and Peas, upon a slow limited scale, remained unaltered in value. Good mealing Oats, being in short supply, were quite as dear as before. Oatmeal in tolerable request at previous rates. Indian Corn commanding more attention to-day, holders were firm, and the decline above-mentioned was partly recovered.——TUESDAY, Nov. 12.—We have again to report a very limited sale for English, Irish, and foreign Wheat of all descriptions, without the least quotable variation from the currency of this day se'nnight. Flour fully maintained late prices. Barley and Malt moved slowly at previous rates, and Beans as well as Peas were rather easier to purchase. Prime new mealing Oats, continuing to meet a fair demand, were 3*d.* per 45 lbs. dearer, all other kinds remaining dull at former rates. Oatmeal in somewhat improved request, good marks of new realising an advance of 3*d.* per load. Indian Corn recovered the decline of Tuesday last. Present prices: Wheat, English red, per 70 lbs., 5*s.* 7*d.* to 6*s.* 3*d.*; white, 6*s.* 0*d.* to 6*s.* 6*d.* Barley, Scotch and Irish, per 60 lbs., 2*s.* 10*d.* to 3*s.* 2*d.* Malt, English, per qr. pale, 50*s.* to 55*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 9*d.* to 3*s.* 0*d.* Beans, English, per qr., 27*s.* to 31*s.* Pease, do. do., 29*s.* to 32*s.*

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The Council of the Royal Agricultural College, at Cirencester, having elected, as their new Principal, the Rev. JOHN SAYER HAYGARTH, M.A., intend, after the ensuing Christmas Vacation, to receive within the walls of the College, Students under 16 years of age. A limited number of Students between the ages of 16 and 20 will be received in a commodious boarding-house in the town of Cirencester, under the immediate superintendence of a resident Master or Professor. The arrangement respecting Out-Students above the age of 20 will remain as heretofore.

It is intended to provide such a system of religious and moral training, as well as of instruction, both agricultural and general, as may be adapted to the various ages of the Students. Further particulars respecting terms, &c., will appear in a few days, or they may be learnt on application to the Principal. Letters to be addressed, Rev. J. S. HAYGARTH, Rodmarton, Cirencester.

ROYAL SOCIETY FOR THE PROMOTION AND IMPROVEMENT OF THE GROWTH OF FLAX IN IRELAND.—The ANNUAL MEETING of the Society will take place on FRIDAY, the 29th inst., at 12 o'clock, to receive the Annual Report of the Committee, to elect Office-bearers for the ensuing year, and to transact such other business as may be brought forward.

(By order) JAMES MACADAM, Jun., Secretary.
Commercial Buildings, Belfast, Nov. 12.

THE APPROACHING COLD WEATHER.

THERMOMETERS FOR REGISTERING THE EXTREMES OF HEAT AND COLD, of the best construction, 1*l.* 1*s.* and 18*s.*; of the common construction, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.* Night Thermometers for Registering Cold only, 10*s.*, 7*s.* 6*d.*, 5*s.*, to 2*s.* 6*d.* Thermometers for Baths or Brewing, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, to 2*s.* 6*d.* Hotbed Thermometers to 4 feet long, 25*s.*, 20*s.*, 17*s.* 6*d.* Steam-pressure Gauges, 2*l.* 5*s.* and 2*l.* 2*s.* Rain Gauges, from 10*s.* Lactometers for showing the Quality of Milk, with instructions for use, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, 5*s.* Hydrometers for trying Sulphuric Acid, 10*s.*, 7*s.* 6*d.*, 5*s.* Barometers, Microscopes, Telescopes, Drawing Instruments, &c.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

FURZE MACHINE.

COTTAM AND HALLEN have now brought to perfection FIRCHILD'S PATENT FURZE CUTTER AND BRUISER, for the preparing of Furze for Feeding Horses and Cattle. The Machine may be worked by horse-power, and will cut and bruise at the rate of 20 bushels per hour with one horse, a man, and boy; with two horses, 40 bushels per hour; if a steam-engine, in proportion to the power applied. The Machine is now on view at COTTAM and HALLEN'S, No. 2, Winsley-street, Oxford-street, where every other description of Agricultural Machinery may be seen.

TO DEALERS IN ARTIFICIAL MANURE.—AGENTS WANTED FOR THE SALE OF IRISH PEAT CHARCOAL.—Letters, post-paid, stating terms, commission, &c., to be addressed to the Secretary of the Irish Amelioration Society, 9, Waterloo-place, Pall Mall, London.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

THE HUMAN HAIR.—Of the numerous compounds constantly announced for promoting the growth or reproduction of the human hair, few survive, even in name, beyond a very limited period, whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The unprecedented success of this discovery, either in preserving the Hair in its original strength and beauty, or restoring it when lost, is universally known and appreciated; and is recorded by testimonials most numerous in themselves, and certified by the highest authorities. It has obtained the exclusive patronage of Royalty, not only as regards our own Court, but those of the whole of Europe. From its exquisite purity and delicacy, it is admirably adapted for the hair of children, even of the most tender age, and is in constant use in the nursery of Royalty, and by the families of the Nobility and Aristocracy. It is alike suited for either sex, and, whether employed to embellish the tresses of female beauty, or to add to the attractions of manly grace and aspect, will be found an indispensable auxiliary to the toilet, both of ladies and gentlemen. Price 3*s.* 6*d.* and 7*s.*; or family bottles (equal to four small), at 10*s.* 6*d.*; and double that size, 21*s.*

CAUTION.—On the wrapper of each bottle of the GENUINE article are these words, in two lines, "ROWLAND'S MACASSAR OIL." Sold by A. ROWLAND and SONS, 20, Hatton Garden, London, and by all chemists and perfumers.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle.

MECHI'S MULTIFORMIA, 4, Leadenhall-street.—This elegant appendage to the drawing-room in Papier Maché, comprises within itself a Pole Screen, a Chess Table, a Reading Desk, and a Music Stand. MECHI solicits the attention of the tasteful to this novelty, as well as to the general contents of his new Show Room, in which are exhibited the most perfect specimens of Papier Maché produced in this country. An immense variety of ladies' and gentlemen's Dressing Cases, Work-tables, Tea Pays, Tea Trays, Hand Screens, Pole Screens, Card, Cake, and Note Baskets. Everything for the Toilet and Work Table, of the best quality, and at moderate prices, may be had at MECHI'S, 4, Leadenhall-street, London, near the India House.

INDIGESTION AND COMPLAINTS OF THE STOMACH CURED BY HOLLOWAY'S PILLS.—The symptoms arising from Dyspepsia and disordered stomachs are spasms, flatulent and acid eructations, languor, want of appetite, distention of the stomach, flushed countenance, sense of oppression and sinking after meals, dejected spirits and defective circulation of the blood; also frequent pains in the head and breast. To remove these unpleasant sensations it is only necessary to take a few doses of HOLLOWAY'S Pills; this inestimable medicine will speedily palliate the most urgent symptoms, restore the tone of the stomach, and prevent a recurrence of the disease.—Sold by all druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

28, UPPER GOWER-STREET, AND 27, IVY LANE, PATERNOSTER ROW, LONDON.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready.*

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry and Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION.

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical:

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY.

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY. By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structure of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

SECOND EDITION REVISED, AND ENLARGED,

Price 5*s.* 6*d.*, cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Istwood with Keswick.

The Birds treated of are

Domestic Fowl in general	The Musk Duck	The Golden and Silver Hamburgh Fowls
The Guinea Fowl	The Grey China Goose	The Cuckoo Fowl
The Spanish Fowl	The White Fronted or Laughing Goose	The Blue Dun Fowl
The Speckled Dorkings	The Wigeon	The Lark-crested Fowl
The Cochin-China Fowl	The Teal and its congeners	The Poland Fowl
The Malay Fowl	The White China Goose	Bantam Fowls
The Pheasant Malay Fowl	The Tame Duck	The Rumpless Fowl
The Game Fowl	The Domestic Goose	The Silky and Negro Fowls
The Mute Swan	The Bernicle Goose	The Frizzled or Friesland Fowls
The Canada Goose	The Brent Goose	
The Egyptian, or Cape Goose	The Turkey	
	The Pea Fowl	

"This book is the best and most modern authority that can be consulted on the general management of Poultry."—*Stirling Observer.*

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle.*

THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS.

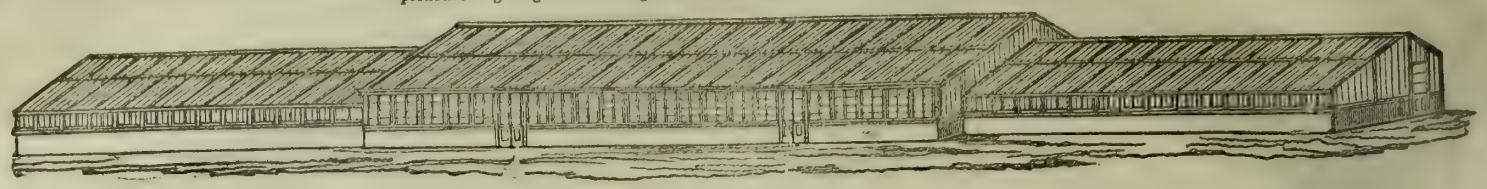
By JOSEPH PAXTON, Gardener to His Grace the Duke of Devonshire, &c. &c.

Reprinted from the GARDENER'S CHRONICLE; above 58,000 have already been sold.

Price 3*s.* 6*d.* (post free.)

THE TREE ROSE.—Practical Instructions for its Formation and Culture. Illustrated by 24 Woodcuts. Reprinted from the GARDENERS' CHRONICLE, with additions.

CONTENTS.



Annual pruning	Planting out, arrangement of trees, &c.	distance, shortening heads, &c.
time, principle of execution, &c.	Pushing eye, spring treatment of dwarf shoots from	saw proper for the purpose
Binding up	Roses, different sorts on the same stock	GRAFTING.
Budding knife	Roses, short list of desirable sorts for budding with a pushing eye	Aphides, to keep down
Budding, time of year, day, time of day, state of the plant, care of buds	Sap-bud, treatment of	Free-growers, remarks on
Budding upon body	Shape of trees	Graft, binding up and finishing
Bud, insertion of, into stock	Shoots and buds, choice of	Grafting, advantage of
Bud, preparation of, for use	Shoots for budding upon, and their arrangement	Grafting, disadvantage of
Buds, dormant and pushing	Shoots, keeping even, and removing thorns	Operation in different months
Buds, failing	Shortening wild shoots	Preliminary observations
Buds, securing a supply of	Stocks, planting out for budding upon; the means of procuring; colour, age, height; sorts for different species of Rose; taking up, trimming roots, sending	Roses, catalogue and brief description of a few sorts
Caterpillars, slugs, and snails, to destroy		Scion, preparation and insertion of
Causes of success		Scion, choice and arrangement of
Dormant buds, theory of replanting with explained		Stock, preparation of
Guards against		APPENDIX.
Labelling [wind		A selection of varieties
Loosing ligatures		Comparison between building and grafting
March pruning		
Mixture for healing wounds		
Pruning for transplantation		

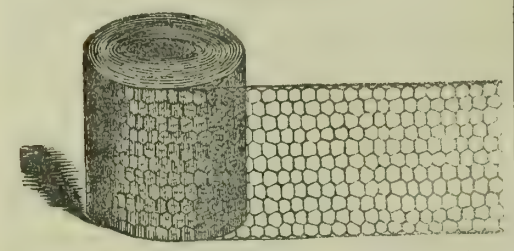
London: J. MATTHEWS, 5, Upper Wellington-street, Strand; and may be ordered of all booksellers.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.



[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

DR. S. NEWINGTON'S IMPLEMENTS OF AGRICULTURE.—These Implements have been invented to introduce an improved system of cultivation, and a more scientific method of depositing the seed. A Prospectus and Lecture on the different methods may be obtained (gratis) by applying to Messrs. Dufaur and Co., Agricultural Depôt, 21, Red Lion-square, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

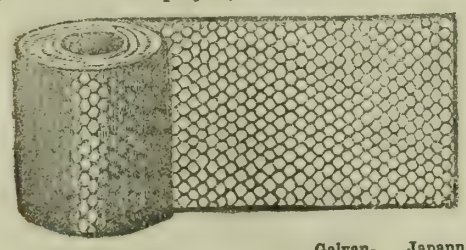
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3	15 0
Do. of 100 yards, 24 ins. wide	.. ..	5	0 0
Do. of 100 yards, 30 ins. wide	.. ..	6	5 0
Do. of 100 yards, 36 ins. wide	.. ..	7	10 0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

HORNSEY ROAD.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. W. J. Pamplin to submit to public competition by Auction, on the premises, Paradise Nursery, Hornsey-road, Islington, on MONDAY, November 18th, and following day, a part of the valuable NURSERY STOCK, comprising fine Evergreens, &c.; also choice Greenhouse Plants, consisting of Double Camellias, beautifully set with bloom buds, 18 inches to 6 feet, Azalea indica, Epacris, Ericas of all the leading varieties, Chrysanthemums, &c.—May be viewed prior to the sale; Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The Nursery to be Let, with immediate possession. The remaining Stock may be taken at valuation, if required.

IMPORTANT TO SEEDSMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. Hay, Anderson, and Sangster, to offer to public competition, by Auction, on the premises, Nursery Warehouse, Bird-street, West-square, Lambeth (in consequence of one of the partners retiring from the business), on THURSDAY, November 21st, 1850, at 11 o'clock, a large portion of their valuable Stock of SEEDS, viz., Peas, Turnip, Cabbage, Onion, Mangold Wurzel, &c.; also a large Timber erection, Tile-roof, &c.; a capital 6-inch wheel Cart.—May be viewed, and Catalogues had of Messrs. Hay, Sangster, and Co., Newington Butts; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, November 22, at 12 o'clock, a choice assortment of Fruit and Ornamental Trees, from Messrs. P. and M. Koster, at Boskoop, Holland; also a choice assortment of Dutch Roots, Standard and Dwarf Roses, &c.—May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

FULHAM ROAD.

MR. D. A. RAMSAY has received instructions from Mr. J. Shearman to submit to public competition on the premises, opposite Chelsea Park, Fulham-road, Brompton, on MONDAY, November 18, at 11 o'clock, on account of the number of lots (his lease having nearly expired), a further portion of the VALUABLE NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, and other Fruit Trees, Evergreens, Deciduous Shrubs, Ornamental Trees, Standard and Dwarf Roses, &c.—May be viewed prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneer, Brompton Auction Ground Fulham-road, Brompton, near London.

MR. HASLAM will sell, at the Auction Mart, on TUESDAY, November 19, and three following days, the STOCK OF A FLORIST RETIRING FROM BUSINESS, consisting of 1000 Roses, 1 and 2 years budded, principally Perpetuals; 1700 pots of Primulas, Violets, Lobelias, Veronicas, Sollyas, Pinks (named), Phloxes, Pansies, Antirrhinums, Linaria, Hepatica (blue), Delphiniums, Ornamental Shrubs, Dutch Bulbs, &c. &c.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.

Price's Patent Candle Company, Belmont, Vauxhall.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.

It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.

None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

RENDLE'S PRICE CURRENT, OR GARDEN DIRECTORY FOR 1851.

Stamped as a Newspaper, to go free by post.

On the 20th of November next will be published, by Messrs. Bradbury and Evans, Whitefriars, "RENDLE'S PRICE CURRENT, OR GARDEN DIRECTORY FOR 1851." *It will be stamped as a Newspaper, to go free by post, and will contain 24 folio pages, being precisely the same size as the* "Gardeners' Chronicle and Agricultural Gazette," *including the Newspaper portion.*

It contains a descriptive Catalogue of the best Culinary Vegetables in cultivation, with the time of sowing, height, and other useful particulars, as well as the quantities furnished by William E. Rendle and Co. for their Collections; also a descriptive Catalogue of all the choicest and best varieties of Agricultural Seeds; and an excellent descriptive List of all the newest and choicest Flower Seeds, giving—1st, the hardiness and duration of each variety; 2d, the colour; 3d, the height; and 4th, the time of flowering; with some useful information and advice relating to the proper mode of culture, and the manner of testing the quality of good seeds. It also gives a full detailed list of all the best German Seeds, such as Stocks, Asters, &c., as well as the quantities furnished by William E. Rendle and Co. for their Collections.

It likewise contains A COMPLETE CALENDAR OF OPERATIONS in the Kitchen Garden, for every month in the year, in a concise and useful form; and in addition, A COMPLETE GARDEN ALMANACK FOR 1851, with many useful Notes and Tables relating to Gardens and Gardening Operations. It also contains a short descriptive account of the Gigantic Water Lily or Victoria Regia, as well as Paxton's Palace of Glass, and the Botanic Gardens, Plymouth.

The Proprietors have offered two Prizes of Five Guineas each for the best Essays on the "Cultivation and General Management of a Kitchen-Garden," *and* "On Communicating Heat to Horticultural Buildings," *to be competed for by Gentlemen's Gardeners. For particulars see the Directory.*

The present edition will be found to be very superior to the Catalogue sent out by us last year, and will be of much service to all who have gardens.

Price *Fivepence*, to be had of all Booksellers, or *Sixpence* stamped, to go free by post. To be obtained of every newsagent who supplies the *Gardeners' Chronicle*; through Messrs. Bradbury and Evans, Publishers, Whitefriars, London; or from WILLIAM E. RENDLE and CO.,
Seed Merchants, Plymouth.

Send six penny stamps, and a copy will be sent by return of post. This amount will be returned if desired to all purchasers.

*** *This Catalogue will go free to our Colonies; in fact, to every country where the* "Times" *goes.*

Just published, a New Edition, with 10 Plates and several Diagrams, in imperial 8vo, price 10*s.* 6*d.*, cloth.

THE HORSE'S FOOT; and, How to Keep it Sound. By William Miles, Esq. Seventh Edition, enlarged, with an Appendix on Shoeing in general and Hunters in particular, and a new Preface.

*** Two Casts or Models of Shoes may be had, displaying the kinds of Shoeing described in the work, one shod for general purposes, and the other with leather; price 3*s.* each.

London: Longman, Brown, Green, and Longmans.

This day is published, in demy 8vo, with Woodcuts, price 4*d.*,

STOP THIEF; or, Hints to Housekeepers to Prevent Housebreaking. By George Cruikshank.

London: Published and Printed for the Author by Bradbury and Evans, 11, Bouverie-street.

COMPLETION OF DAVID COPPERFIELD.

This day is published, complete in one volume, 8vo, with 40 illustrations, by H. K. Browne, price 21*s.* cloth, or 24*s.* 6*d.* half-bound morocco,

THE PERSONAL HISTORY OF DAVID COPPERFIELD. By Charles Dickens.

Bradbury and Evans, 11, Bouverie-street.

FAMILIAR THINGS.
A BOOK.
A NEEDLE.
A BOUQUET OF FLOWERS.

THE CATHOLIC QUESTION.—Gilbert's Verbatim Editions of the Pope's Letter; Cardinal Wiseman's Pastoral; Lord John Russell's Letter; Bishop Ullathorne's two Letters to the *Times*; two Letters from the Rev. G. A. Denison; the "New Batch of Bishops," from the *Weekly Dispatch*; Letter from Benjamin Disraeli, Esq., M.P.; Review and Extracts from Ambrose Phillips's Letter to the Earl of Shrewsbury; concluded by a Biography of the Cardinal. All these important documents may be had in one pamphlet, at the extraordinary low price of One Penny; or Postage Free, 3*d.*; or, for very extensive distribution throughout the kingdom, at 7*s.* per 100. Also, uniform, at the same price, complete in one pamphlet, the Bishop of London's Charge and Dr. Cumming's Lecture.

Published by James Gilbert, 49, Paternoster-row, London.
Orders received by all Booksellers, Newsvendors, &c.

Printed by William Bradbury, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the Parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 16, 1850.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Nov. 30.

RENDLE'S NURSERY, PLYMOUTH, Established 1786.

WILLIAM E. RENDLE AND CO. have this season A LARGE SURPLUS STOCK of many sorts of FOREST TREES and SHRUBS. For prices see the *Gardeners' Chronicle*, November 9, 1850.

Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees, is just published, and can be had for one penny stamp.

Apply to WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

MYATT'S LINNÆUS RHUBARB, strong roots, 12*s.* per dozen; Myatt's Victoria, 9*s.* per dozen; and Mitchell's Royal Albert, 12*s.* per dozen. Extra strong plants of the New Red Currant "Raby Castle," 6*s.* per dozen, or 45*s.* per 100; and Fastolff Raspberry, 10*s.* per 100. With the usual allowance to the Trade. Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, near London.—Nov. 30.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

CORNWELL'S VICTORIA RASPBERRIES.

G. CORNWELL is now sending out STRONG CANES of the above at 25*s.* per 100; 3*s.* 6*d.* per dozen. To be had of GEO. CORNWELL, Market Gardener, Barnet, Herts.
N.B.—A quantity of Red and White Currants.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

"CEDRUS DEODARA" AND "CUPRESSUS TORULOSA ELEGANTISSIMA."

WM. MAULE AND SONS are now prepared to offer, from their large supplies of CEDRUS DEODARA of various sizes, many thousands of fine specimen plants (grown from seed constantly in the open ground and in pots) measuring 3 feet and upwards, unusually fine and bushy, with good leaders, at 60*s.* per dozen; also many thousands of fine plants of CUPRESSUS TORULOSA; the hardy variety Elegantissima in pots, upwards of 2 and 3 feet, at 50*s.* and 75*s.* per hundred; they also abound with good supplies of the Himalaya Conifera generally, together with a large Stock of Scarlet Crimson Himalaya and other hardy Rhododendrons, prices for which will be forwarded on application.

N.B. W. M. and SONS' Lists of prices for Fruit, Forest, Evergreen, and other Trees and Shrubs required at the present planting season, are now ready for distribution, and will be forwarded on application.

References expected from unknown correspondents.
Stapleton-road Nurseries, Bristol.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.

A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.

Our Foreign Bulbs have arrived in fine condition.
Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW GARDEN SEEDS.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth, are now prepared to execute orders for NEW PEAS, including the following excellent sorts.

NEW PEAS—GROWTH OF 1850.

Fairbeard's Champ. of England.	Warner's Early Emperor.
Rendle's First Early.	Prince Albert.
Burbridge's Eclipse.	Essex Champion.
Early Kent.	Early Warwick.
Fairbeard's Surprise.	Auvergne.
Bishop's New long-podded.	Isherwood's Railway.

Our "PRICE CURRENT AND GARDEN DIRECTORY" *is now ready, and contains a Descriptive Catalogue of all the best kinds of* KITCHEN GARDEN, AGRICULTURAL, *and* FLOWER SEEDS, *with a complete* CALENDAR OF OPERATIONS *for every month in the year, and a* GARDEN ALMANAC.

The present edition will be found to be very superior to the Catalogue sent out by us last year, and will be of much service to all who have gardens.

Price *Fivepence*, to be had of all Booksellers, or *Sixpence* stamped, to go free by post. To be obtained of every newsagent who supplies the *Gardeners' Chronicle*; through Messrs. Bradbury and Evans, Publishers, Whitefriars, London; or from WILLIAM E. RENDLE and CO.,
Seed Merchants, Plymouth.

Send six penny stamps, and a copy will be sent by return of post. This amount will be returned if desired to all purchasers.

*** *This Catalogue is stamped as a Newspaper, and contains 24 folio pages, being the same size as the* "Gardeners' Chronicle and Agricultural Gazette," *including the Newspaper portion.*

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS, all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.

For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes. Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.

Exotic Nursery, King's-road, Chelsea, London.

HILL'S COURT NURSERY, EXETER, within 3 minutes' walk of the London Inn, and 10 of the Railway station.—The FORD OAK, the hardiest of all evergreens, was originally raised at this Nursery, and there are at present upwards of 500 Plants in pots, from 3 to 10 feet high. Also a very large collection of LUCOMBE OAK, varying from 3 to 15 feet high, and of superior growth. To be sold at a great reduction in price.—All letters to be addressed to Mr. JOHN NOTT, at the Nursery, and Post-office orders payable to him. Dated HILL'S Court Nursery, November 10, 1850.

RUSSIAN VIOLETS.

R. SHACKELL, in offering his two superior new Violets, "RUSSIAN SUPERB," and "WHITE RUSSIAN" (of which all the Floricultural Publications have spoken in the highest terms), begs to call the attention of Amateur and other Cultivators, to the following reduced prices, at which he can now sell these favourite flowers:—Extra strong blooming plants, "Russian Superb," 12*s.* per doz.; small ditto, such as could be sent by post, 9*s.* per doz.; "White Russian," 6*s.* per doz. Any parties can have a bouquet of each, postage free, by enclosing 12 postage stamps. R. S. has eight other varieties at 3*s.* per doz.

"SIR,—Blooms of your 'Russian Superb,' and a large White Seedling Violet, both seedlings of your raising, were safely received this morning. Having grown a few plants of the 'Russian Superb' myself this season, I have no hesitation in informing you I consider it by far the best hardy Violet cultivated. It blooms most profusely through seven months of the year. The blooms are very large, of a fine blue colour, and most exquisitely fragrant; and as the habit of the plant is strong and good, it must supersede the old varieties. It is well known the Neapolitan requires the shelter of a frame to bloom it in perfection; your present seedlings will enable every one to enjoy the luxury of these charming flowers, without the aid of glass, through the winter months. The 'White Seedling' appears equally in advance of the old kinds, both in size, colour, and fragrance, and is equally to be commended. As no lover of these flowers ought to be without them, I hope the public will patronise these pets of yours, for they are really good things.—I remain, Sir, yours very truly, JOHN SPENCER, Bowood Park, Nov. 13."

"MR. ROBERT SHACKELL, Locksbrook Nursery, Bath."
Locksbrook Nursery, Bath, Nov. 30.

WM. ANDERSON, NURSERY and SEEDSMAN, Dundee, begs to intimate that he has on sale a very extensive stock of Stage AURICULAS and POLYANTHUSES, true to name, comprising many varieties of great merit. Catalogues sent free on application.

Also Viola arborea, white, red, and blue, strong plants, 2*s.* per dozen. Dianthus montana superba, the finest and largest variety of mule Pink, 6*s.*, and extra strong plants 9*s.* per dozen. Hardy Heaths of sorts, 4*s.* a dozen. Laurel Bays, strong bushy plants, 1½ to 2 feet, 8*s.* per 100. Herbaceous plants in great variety, 1*s.* per dozen, 6*s.* per 100.

As W. A.'s Stock of the above articles is very large, the Trade will be supplied on reasonable terms.

PAGE AND CO., SEED MERCHANTS, &c., SOUTHAMPTON.—W. B. PAGE, Jun., has the pleasure of informing the public, that in consequence of his father having transferred to him the entire Seed Trade (reserving to himself the Nursery Department), he has just completed, in addition to the old established Seed Stores, an extensive establishment in Oxford-street, facing the Railway Terminus, adjoining Radley's Hotel, and in the immediate vicinity of the Docks, where Seeds, wholesale and retail, will be offered at the lowest market prices, as well as orders received for Nursery Stock.

PAGE'S PRODIGY PEA (3*s.* 6*d.* per quart), the earliest and most prolific dwarf variety in cultivation, of which we subjoin two Testimonials out of the many received,

PAGE'S GOLIAH PEA, 3*s.* 6*d.* per quart.

"Gentlemen,—I found your Prodigy Pea a very superior dwarf variety, and an abundant bearer. Please send some when you send the Annual Collection of Seeds.
"HENRY WELLS,
"Gardener to the Rt. Hon. Lord Willoughby d'Eresby,
"Grimsthorpe Gardens, Nov. 5, 1850."

"Gentlemen,—Your Prodigy Pea has proved the earliest and most prolific dwarf variety in cultivation, well adapted for growing on Vine or Peach borders, scarcely affording a partial shade. "JAMES DREWETT,
"Gardener to Sir W. Heathcote, Bart., Hunsley Park."

NEW GERANIUMS OF 1849.

GEORGE DAVIES begs to offer the following 10 new GERANIUMS at the exceeding low price of 5*0s.*, package included:—Loveliness (Beck's), Emily (Beck's), Rosalind (Beck's), Nonsuch (Hoyle's), Prince of Orange (Hoyle's), Satisfaction (Hoyle's), Chrisabel (Hoyle's), Magnificent (Foquet's), Gipsy Bride (Foster's), Constance (Foster's). Any of the above can be had separately. As the stock of some of the sorts is rather limited, early orders alone will secure plants.

Also the following 10 for 18*s.*, package included:—Brilliant (Topping's), Cruenta (Beck's), Crusader (Hoyle's), Elegans (Topping's), Princess (Beck's), Centurion (Beck's), Virgin Queen (Arnold's), Rosamond (Beck's), Gustavus (Beck's), Mont Blanc.

CALCEOLARIAS.—Seedlings raised from fine hybridised seed, which G. D. has no doubt will prove equal, if not superior, to any in cultivation. Fine strong plants 6*s.* per doz.

Green-lane Nursery, West Derby, near Liverpool, Nov. 30.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

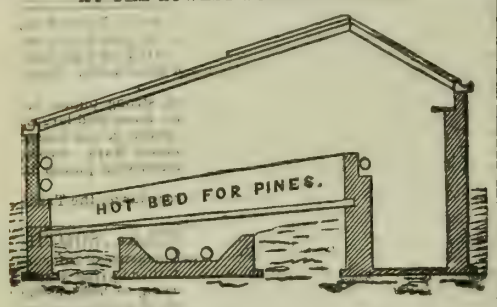
ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

TO ROSE GROWERS.



WANTED, a Quantity of well-rooted MOSS, CABBAGE and SPRING ROSE LAYERS; also the same sorts, that have been bedded one year, and fit for present potting.—Direct, if by letter, post paid, stating price per 100, to F. J. Burk, 14, Summerford-grove, Stoke Newington-road, near London.

GREEN AND HOTHOUSES, strong built, at the following low scale of prices:—Lean-to Roofs, 12 feet by 8, 10*l.*; 16 by 8, 15*l.*; 20 by 10, 20*l.*; 20 by 12, 24*l.*; 24 by 12, 28*l.*; and 28 by 12, 32*l.* Greenhouse Garden Lights, and Window Sashes, complete, painted three times, at 9*d.* per foot. A Greenhouse, ready built, for sale, 16 feet by 9.—Plans and particulars sent by addressing a letter to Mr. Smith, 85, White Lion-street, Islington, London.

Estimates given for Hot-Water Apparatus.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

Glass Shades for Ornaments. Parian Marble. Wax and Alabaster Ornaments. Lamp Shades and Glasses. Patent and British Plate. Ornamental and Stained Glass; and every article in the Trade.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes of various sizes. In all cases, unless the whole box is taken of either size, extra must be charged as specified.

13*s.* 6*d.* per box; or 2*d.* per foot if less than one box be taken:

6 inches	by 4 inches.	6½ inches	by 5 inches
6 ,,	by 4½ ,,	6½ ,,	by 5½ ,,

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* per dozen; Pastry Slabs, Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d.*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, James Phillips and Co., 116, Bishopsgate-street Without.

Dixon v. *Bessell.—Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant 60l., and 10l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.

THE APPROACHING COLD WEATHER.

THERMOMETERS FOR REGISTERING THE EXTREMES OF HEAT AND COLD, of the best construction, 1*l.* 1*s.* and 18*s.*; of the common construction, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.* Night Thermometers for Registering Cold only, 10*s.*, 7*s.* 6*d.*, 5*s.*, to 2*s.* 6*d.* Thermometers for Baths or Brewing, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, to 2*s.* 6*d.* Hotbed Thermometers to 4 feet long, 25*s.*, 20*s.*, 17*s.* 6*d.* Steam-pressure Gauges, 2*l.* 5*s.* and 2*l.* 2*s.* Rain Gauges, from 10*s.* Lactometers for showing the Quality of Milk, with instructions for use, 15*s.*, 12*s.* 6*d.*, 10*s.*, 7*s.* 6*d.*, 5*s.* Hydrometers for trying Sulphuric Acid, 10*s.*, 7*s.* 6*d.*, 5*s.* Barometers, Microscopes, Telescopes, Drawing Instruments, &c.

Henry Baker, Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

CLARK'S PATENT ELONGATING GALOSH.—The Patent Elongating Gutta Percha Galoshes will be found unrivalled in their advantages over every other Galosh or overshoe. They may be put on or taken off without touching with the hands, or even stooping; and they hold perfectly tight on the foot without requiring any fastening. They are lighter than any other Galosh. The elasticity of the waist makes them very easy in wear. They are not liable to slip on the smoothest flags; even in frosty weather their slipping may easily be prevented by slightly warming the heels and pressing them into sand or other rough material. They are sufficiently open in the uppers not to confine the perspiration of the foot; and having Gutta Percha Soles, they are perfectly waterproof, and well adapted for walking over wet ground.

C. and J. Clark, Patentees, Street, near Glastonbury. Wholesale Agent for London: A. Haymond, 1, Regent-street, City-road; and to be had retail of most respectable Boot and Shoemakers.

FREEHOLD LAND TO BE SOLD, nearly adjoining the Uxbridge-road, a short distance beyond Kensington-gardens, and extending northward to the Harrow-road. The Great Western Railway passes through part of the property, the terminus being distant one mile from it. The property comprises 166 Acres, now held by a tenant from year to year, and is under cultivation as a Grass Farm, having a good House and suitable Outbuildings, but is admirably adapted for Building Ground, Nursery Grounds, or Market Gardens, the land to the south of part of the property lying between it and the Uxbridge-road being already built on, and a good road made through it. There is good Brick Earth on the estate. To be sold in one lot, or in separate lots of not less than 10 acres, at 1000*l.* an acre. If small lots are taken for building purposes, they must be laid out on a plan to be agreed on as to roads, &c., across the entire property, so as not to interfere with the sale of other parts.

For further particulars, apply to Messrs. Lowe, Solicitors, No. 2, Tanfield-court, Inner Temple, London.

THE WIDOW of the late Rev. GEORGE EDWARD HOLLEST, of Frimley, Surrey.

Frimley, Bagshot, November 26, 1850.

An earnest appeal to public benevolence is respectfully submitted by a few friends and neighbours on behalf of the Widow of the late Rev. George Edward Hollest, who, for a period of 18 years, in an exemplary manner, performed the duties of his Church; and was distinguished by his benevolence and charity in the wide district under his charge.

The act of atrocity by which the Rev. Mr. Hollest was suddenly cut off is universally known, but those only who are acquainted with his position are aware that he never had the means of making a provision for his Widow. Under such circumstances, it is hoped that the case of Mrs. Hollest will commend itself to the generous consideration of those who are blessed with the means of alleviating, so far as human sympathy and assistance can alleviate, the distress of a family so fearfully bereft of its natural supporter. The income of Mrs. Hollest does not exceed 40*l.* per annum, and subscriptions are earnestly solicited in aid of these inadequate means.

Subscriptions will be thankfully received by the following Bankers:—

Messrs. Herries, Farquhar, and Co.
— Williams, Deacon, and Co.
— Barclay, Tritton, and Co.
— Coutts and Co.
Messrs. Smith, Payne, and Co.
Sir S. Scott, Bart. and Co., 1, Cavendish-square.
Messrs. Mangles Brothers, Guildford.
— Stephens and Blandy, Reading.

Also, by the following members of the Committee:—

R. R. Bayley, Esq., Mitchett, Frimley, Bagshot.
J. F. Burrell, Esq., Manor-house, Frimley.
Rev. J. H. Clayton, Farnborough, Bagshot.
Rev. John Lawrell, Cove, Bagshot.
Sir Walter Farquhar, Bart., Farnborough Place, Bagshot.
Thomas Longman, Esq., Farnborough-hill, Bagshot.
Captain Charles Edward Mangles, Poyle-park, Farnham, Surrey.

The Committee have the satisfaction to state that Her Majesty the Queen, the Duchess of Gloucester, and the Bishop of Winchester, have sanctioned their exertions by very liberal donations.

A List of Subscriptions will appear in a future Advertisement.

TO MARKET GARDENERS, NURSERYMEN, & OTHERS.

TO BE DISPOSED OF, a LEASE of about Six Acres of MARKET GARDEN GROUND, with growing Crops; a good, new, and substantial Brick House on the ground, at a very low rent, within eight miles of London, in consequence of a death in the family.—For particulars, enquire of T. Barnard, 9, Great Russell-street, Covent-garden, London.

SOMERSETSHIRE.

TO BE LET, and entered upon at Lady-Day next, PRIDDY HILL FARM, situate on the range of the Mendip Hills, about five miles from the City of Wells, containing nearly 300 Acres of Arable Land. The soil is loamy, easily worked, and well adapted to the growth of TURNIPS and GREEN CROPS. The Buildings are extensive and good. There are 10 Acres of GORSE planted on the Farm; and a Machine, erected by Barrett, Exall, and Andrewes, to prepare it for use. The rent and payments are only about 12*s.* an Acre.—Apply to Mr. Joseph Edwards, Land Agent, Hutton, near Wells, Somerset.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, Lea and Perrins, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "Lea and Perrins" are upon the label and patent cap of the bottle.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.

Price's Patent Candle Company, Belmont, Vauxhall.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at Metcalfe, Bingley, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "Metcalfe, Bingley, and Co., 130 B, Oxford-street, London."

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of John Willis accompanies each packet.

HOME GROWN SEEDS, CARRIAGE FREE.
NEW GARDEN SEEDS AT LOW PRICES.

JOHN SUTTON AND SONS have now harvested and arranged for sale all their new GARDEN SEEDS, and would especially recommend the under-mentioned for early sowing:

NEW PEAS.	Per Quart—s. d.
Sutton's Early Champion, the forwardest sort known	1 0
Champion of England	0 10
Fairbeard's Surprise	0 9
Auvergne	0 9
Warner's Emperor	0 10
Sutton's Early Goliah	0 10

Soden's Early Oxford	3 0
True Early Ten-weeks	3 6
Sutton's Early Frame	2 6
Grigor's Early Round	2 0
Lawson's Early Globe	2 0
Red Ash-leaf Kidney	2 6
And several others.	

CARROT.	Per oz.
Early Horn, selected	0 4
James's Early Orange	0 4

LETTUCE.	
Sutton's Superb Cos, splendid large white heart, requires no tying	1 0

JOHN SUTTON and SONS have also a fine stock of all other Garden Seeds of superior quality, being all of home growth, at equally low prices.

*** *Early Orders will have the preference of scarce articles.*

N.B. Parcels of not less than 10*s. value are sent, carriage free, to any Station on the Great Western, South-Western, and South-Eastern Railways, or to any office in London or Bristol.*

Address—JOHN SUTTON and SONS, *Reading, Berks.*

NEW DOUBLE DAISIES.

JOHN SALTER can at this time furnish all the beautiful new varieties of FOREIGN DAISIES, noticed in the leading article of the *Gardeners' Chronicle* of last week, and some of which have been figured in the "Flore des Serres et des Jardins de l'Europe." Twenty-five distinct varieties, 20*s.*; Twelve ditto, 12*s.* Post-Office Orders to be made payable at Hammersmith. His Seedling and other new Chrysanthemums, both large varieties and pompous, are now in bloom. He is proud to say his three Seedlings, "Queen of England," "Annie Salter," and "Nancy de Lermet," are universally allowed to be the finest extant.

Versailles Nursery, William-street, Hammersmith Turnpike.

KITLEY'S GOLIAH STRAWBERRY.—Strong Plants for Cash, at 2*s.* per doz., or 10*s.* per hundred. The Collection of CHRYSANTHEMUMS, comprising all the latest improvements, are in bloom; and all admirers are respectfully invited to view the same.—Address, Robert WHIBLEY, Chester Nursery, Kennington, London.

PIMLICO SLATE WORKS. — Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS's Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 30, 1850.

THE manner in which the races of plants are affected by CLIMATE is one so eminently horticultural that it can hardly be too much illustrated by facts. Even the most minute fixed deviations become worthy of record if they can be shown to be permanent and really to be consequent upon the action of meteorological phænomena. The supply of this class of facts, up to the present time, is so scanty that no theory or rational speculation can be safely founded upon them; and what is worse, they are in many cases apocryphal, to say the least. We should, therefore, be glad to find the intelligent readers of the *Gardeners' Chronicle* disposed to discuss this matter, either at length, or in some of its more limited forms. And in order to raise the question, we venture to bring under their notice the following case.

Mr. HENFREY, in a late number of the "Botanical Gazette," in the course of a consideration of the nature of the species of plants, has the following passage:—"It is stated also that the *first* Apples, Pears, and Peaches taken to Virginia, *produced mere crabs*, but by degrees were converted into excellent kinds, being the stock from which those now commonly grown there have descended; and, what is very striking, these races differ from the races growing in the old world, which furnished the original seeds, varying in a different direction under the different climate." The point to which we would just now draw attention, is that in italics. Mr. HENFREY's authority for this statement is the following passage in CHEVREUL's ingenious essay on "Species." The author's words are these:—"In North America, neither Pear-trees, nor Apple-trees, nor Peach-trees, exist in a wild state, belonging to the species of our own continent. The Europeans, in settling there about three centuries since, carried thither the seeds of these trees; but instead of reproducing our cultivated variety, *they yielded*, at least in Virginia, *in the first generation, trees producing nothing but wild fruit, too austere to be eaten by people accustomed to our cultivated fruits.* The seeds of the American fruits of this first generation, produced trees whose fruit was a little less bad than those of the preceding generation; and finally, from generation to generation, there was a perceptible improvement, but still of such a nature that the fruits last produced are still inferior to our own; and, what is remarkable, those which have improved the most from seed differ from the fruits of Europe in taste and perfume. These facts, which M. POITEAU collected in Virginia five-and-forty years ago, prove the modifications produced by a succession of generations of plants, the issue of a single seed, and at the same time justify my definition of a species. And if it is said that the seeds of the first fruit trees sent to Virginia could not have belonged to varieties possessing qualities of the same excellence as the varieties now cultivated, nevertheless the fact would remain that *fruits gathered in Virginia were absolutely different from those which their ancestors produced at the same time in Europe.*"

The question then which we should like to raise is, *whether we have any certain evidence that the seeds of cultivated fruit trees of high quality revert immediately to the state of wildings*, upon being raised *in a distant colony*. Other important questions are involved in M. CHEVREUL's argument, but it will be most convenient to limit the inquiry for the present to the simple point above described. And we should be thankful to any correspondent who has personal knowledge of what happens in this respect, or who has information, not personal, on which he can rely, if he will communicate it to us for publication. If the statement adopted by M. CHEVREUL is true, then we must have the same instantaneous deterioration of cultivated fruits when the seeds are sown in our colonies at the present day, as is said to have happened three centuries ago. Is this so? can it be so?

IN a recent number of DICKENS's *Household Words*, is an admirable account of the manner in which one of the working clergy surmounted difficulties, at which most men would have been appalled. In a parish, steeped to the lips in poverty, he succeeded in building churches, founding and supporting schools, and introducing reformations of all kinds. The secret of his success was contained in three small words. "I'LL TRY," was the spell with which he worked his wonders. No difficulty deterred him from *trying;* with a resolute mind, good sense and patience, he found that all human obstacles were capable of being removed from his path. He commenced his labours in the midst of want, misery, and ignorance; he ended in a scene of ease, comfort, and intelligence.

Gardening presents, in another way, abundant illustrations of the same truth. Look where we will, the potency of "I'LL TRY," is manifest; it is the *open sesame* of horticulture. To take some recent cases, let us first look at Orchideous epiphytes. It is not a quarter of a century since they were regarded as uncultivable; a friend of ours determined *to try*, and we have already arrived at proposals to grow them for the million. Then we were assured that Cape Heaths could not become every-day objects of greenhouse decoration. The country gardeners were of opinion that the attempt was hopeless; there was a secret in it; it was very well for LEE and KENNEDY; they knew how; but in the country, Heaths would not grow; at last they *tried* in earnest, and the difficulty is forgotten. Roses in pots were pronounced unattainable; and wretched enough were the earliest examples; but men *tried and tried* again, until they have become the glory of the summer. Just now we are informed that Pansies can't be grown and shown in pots; if the growers *try*, and use a little common sense, they will succeed in this as in other things.

A more important matter than nursing a Pansy in a flower-pot is the cultivation of "American plants;" and here again the virtues of "I'll try" become apparent. We are aware that people are to be found in all directions who assert, as Mr. MACPHERSON declares*, that *they have tried them; that all in their part of the country have tried them, and that every one has been disappointed; they will not do with them.*" But when we look a little into the manner in which the trial has been made, we find that it consisted in buying a lot of plants, and putting them into places wholly foreign to their nature and habits. This is well pointed out by the writer whose little book we have just quoted, from which we make the following extract, with a few verbal alterations.

"That *they must have bog and be planted in the shade*, has always been the prevailing opinion; consequently, some cold corner is frequently selected, the soil taken out, perhaps to an unnecessary depth, and the bed filled with rich peat, in which the plants are placed. Here they grow luxuriantly; but soon, in their dark and shady situations lose their blooming properties, the branches of the surrounding trees form a canopy over-head, and the pernicious drip from their leaves renders them sickly, dirty, and meagre; while, perhaps, some of their rougher neighbours, Portugal or common Laurels, gain the ascendancy, and smother their more slow-growing companions. In this case they are soon forgotten, and the American ground is only known by name; it becomes a receptacle of the sweepings of walks, and a harbour for refuse; the gardener takes no interest in the matter, and his master quietly remarks, when he sees the American plants flourishing elsewhere, *that he has tried them and they would not do.* If not planted in such a situation as the one just named, they are perhaps within the reach of the roots of some well-established Limes, or, what is worse, of that robber the Elm, whose depredations the horticultural and agricultural world is well acquainted with. These roots soon turn towards the well-filled granary, and fasten on the rich and far-fetched soil. To hungry invaders like these, the beautiful strangers can offer no resistance. Although able to stand the scorching heat of a meridian sun—to flower almost on the margin of perpetual snow—to flourish luxuriantly in the wild glen, or to brave the tempest on the mountain-top; yet here, under the very eye of man, they perish. No horticultural physician is consulted as to their disease; they are left to their fate; the roots of their powerful foes form a net round the balls of earth they brought with them from the nursery, and suck away the little nourishment remaining there. In other cases a good situation is selected, far removed from overtopping boughs or underground invaders; clumps are formed on a lawn, and the centre of the beds rises *considerably above the level of the surrounding turf, to give what is generally termed effect to the plants.* Here it is expected they must thrive, and for a time all goes on well, till the ground becomes hard, and the fibres of the plants have filled the soil with their hair-like roots. Probably they have bloomed finely, and now make an effort to grow, and provide wood and flower-buds for the following year; only to be accomplished by the aid of a large supply of moisture at their roots. But how is this to be obtained? The months of June and July are very frequently dry, and when rain falls it is in torrents; this cannot benefit plants placed on convex beds, off which the water runs, and stands round the margin in a puddle: the consequence is soon seen by the sickly state of their drooping leaves. The passing shower has merely refreshed the roots at the surface, and, like the cup of TANTALUS, heightened their affliction. They may lift their sapless foliage for a short time; but a few noontide suns prove it to be only the last effort of expiring nature. Their withered leaves rattle in the wind like the parchment label that spake their rank and character, when brought from the nursery, and in this state they are shown, in order to silence and convince unbelievers that they have been tried *and will not do.*"

We need not say that this sort of trying must carry failure along with it. In trying, as in most things, common sense will be found a companion, without which no progress can be made. There is no common sense in the trials which Mr. MACPHERSON so truly describes. What are called American plants are all alike in this respect, that they have extremely fine hair-like roots, containing in themselves no reservoir of moisture, and therefore requiring to be continually surrounded by dampness. In the presence of dryness the roots immediately wither, and never revive. Dampness seems indeed to be more important to them than soil; for we find them growing on the branches of trees, like epiphytes, in climates where the air is unceasingly charged with moisture.

What the gardener has to do, then, in providing for his American plants is, to keep them below the surface of the surrounding ground, so that what rain falls may be retained in it; and to give them a kind of soil which offers little resistance to the passage of hair-like roots. In this lies, as we have stated on many former occasions, the whole art of growing Rhododendrons, Azaleas, and similar plants, in the

* WATERER's System of Growing the Rhododendron, Azalea, Kalmia, &c., by W. B. MACPHERSON. 12mo. SIMPKIN. Pp. 46.

greatest perfection. A man who tries to preserve his soil damp, and to provide a light porous soil, must be an uncommonly dull fellow if he cannot succeed.

The Woking and Bagshot American plants are the world's wonder. The marvellous exhibitions made by Mr. Hosea Waterer and the Bagshot growers have excited much curiosity as to the where and how such results are attained. The place where Mr. Hosea Waterer, the greatest of these cultivators, grows his plants is described with accuracy by Mr. Macpherson as being seated in the midst of a bleak, barren common, without shelter or shade, exposed to the burning heat of summer, and open to the rude blasts of winter, and suffering both from early frosts in autumn and late ones in spring. Even at Midsummer the young shoot is not safe in this ungenial climate. Yet, in such a situation as this, the finest American plants in Europe are grown for sale. Rhododendron *trees* half a century old, Kalmias two yards through, florid Andromedas (*A. floribunda*) scarcely inferior in size, with gorgeous Azaleas, and endless throngs of Heaths and Arbutes, cover acres of this Woking waste. The whole secret of its excellence consists in the soil being soft and never getting dry enough to affect the delicate roots. Constant subsoil moisture, in spite of 4 feet drainage, secures the hardy American plants against everything they have to fear. As for cold, it is their weakest enemy.

That the precise nature of the soil in which they grow is immaterial has been admitted by all the best growers. This was particularly insisted upon by Messrs. Standish and Noble in a pamphlet to which we drew attention some time since. Mr. Macpherson takes the same view.

"The preparation of the ground, he observes, is very simple; in most cases 15 to 18 inches of soil is sufficient, and this may consist of *leaf mould, maiden loam, sandy grit, rotten turf,* or any other light earth *that will allow the water to enter and pass freely to the sponge-like roots,* which it will readily do if the surfaces of the beds are laid flat. Attention should also be paid to plant them so close that in two or three years the branches may overspread the ground in which they grow, as they flourish better when the branches shade their roots; and the flowers produce a finer effect when they mingle their different colours and shades together. The margins of the beds should be well planted with hardy Heaths, Ledums, Vacciniums, and other dwarf-growing plants. Lilium superbum, lanceolatum punctatum, and others of that tribe, will look well in masses between the plants, and will not require removal. For ornamental pieces of water, or planting on the margins of streams, no plant is so well adapted as the Rhododendron. Floating islands can readily be formed of refuse timber made into rafts, on which brushwood or wattle-hurdles should be laid, covered with rushes or flags; the plants being placed on this, to be filled round the balls with leaf-mould is all they require; they can then be drifted to any part of the lake, and will there grow luxuriantly, and soon become a cover for water-fowl and game."

The reader will observe that these are the statements of men of long practice, and admit of no question. Some views of the same kind were expressed by Mr. Forsyth, a very experienced gardener, in our columns a short time since (p. 436). And we would particularly refer the reader to the suggestions there made as to the manner in which proper soil can be most inexpensively made. For the season is at hand when materials can be best collected for preparing such artificial mixtures in readiness for planting in the approaching spring.

GARDENS IN THE NORTH OF ENGLAND, SCOTLAND, AND IRELAND.—No. IV.

Glasgow.—Here there is a botanic garden maintained by the town, but it is too much within the influence of the smoke to flourish; and, I take it, the climate is not very favourable to vegetation, and the Glasgowians are probably too much occupied with their commercial affairs to take much interest in the garden. The houses are large, old, and rambling, and the collection not very interesting; there was a large collection of Orchidaceous plants, and nothing could be more kind and attentive than Mr. Murray, the curator. The plants were not in very good condition; the naming of several appeared doubtful, and the garden is kept up by the 6*d.* entrance fee, and a sale of cut flowers. I believe it is not used by students or for lecturers.

Crossing over to Belfast, nothing could be more striking than the contrast. The Botanic Garden there is in excellent order; the out-door plants arranged systematically, principally in long narrow borders, containing a single row of plants, with a neat Grass path betwixt each, the names conspicuously marked against each plant, and so arranged that as you go down the rows, the names of plants on the left-hand face you, and as you return the names of the plants on the right are facing. Lord Clarendon, when he lately visited these gardens, truly and elegantly observed,—"these borders were like the pages of a living book." I own that till I had seen the Belfast Garden, I had not much faith in the utility of Botanic Gardens. In addition to the borders containing the hardy herbaceous plants and annuals, there is a large collection of hardy shrubs and trees, and also a very complete collection of hardy Ferns and aquatic plants, admirably well arranged. The walks and grounds are beautifully laid out, and the whole kept in excellent order, doing the highest credit to Mr. Ferguson, the curator. There are some good stoves and greenhouses, and also a very tolerable collection of Orchidaceous plants and Ferns, and particularly some good specimens of Cattleya, and Odontoglossum grande, &c., in flower. But both here, at Glasgow, and at Dublin, there are but few of the rarer eastern Orchidaceous plants cultivated. Although too much cannot be said of the beauty and arrangement of these gardens, still the same error has been occasionally committed here as was noticed with respect to the Derby Arboretum; the specimens of rare trees have been planted too close together, and there is the want of a "prophetic eye" in the planter. Mr. Ferguson said this might, to a certain extent, be remedied, and the appearance of nakedness obviated by planting two specimens at the same time, and as they grow removing one of them. I forgot to observe whether he practised what he preached. The admission is open to strangers, and to subscribers and their families, on a small payment, as this is the only means of keeping up the garden. The grounds adjoin those of the beautiful building of the new Queen's College, and it is probable they will be joined to them; and I should hope the students of the college will obtain the advantage of the gardens for study, as at Dublin; the college, however, contributing to the support of the gardens by some small endowment.

Dublin College Garden, though neither so extensive nor so well known as the gardens of Glasnevin, yet is admirably kept, with many very interesting plants, and the Orchidaceous plants well grown: the collection is not large, but there are some fine specimens of good kinds, and it is particularly rich in tropical Ferns. No person should omit seeing this garden: Mr. Bain, in the absence of the curator, Mr. M'Kay (whose "Flora of Ireland" is well known), is very attentive to strangers; and I believe the admission is to all applicants, but I omitted to inquire. In the stove is the great plant of the Dragon-tree which lately flowered, and an account of which has appeared in the *Chronicle;* and there is also a fine specimen of the Skrew Pine. Lectures are delivered at the Garden. *Dodman.*

EXTRACT FROM A MEMOIR ON THE STRUCTURE AND COMPOSITION OF THE SUGAR-CANE.

By M. Payen, "Comptes Rendus," May, 1849.

According to M. Payen, sugar exists in a crystallised state, resembling sugar-candy, in all the thin-sided cylindrical cells which surround the woody bundles and vessels of the Sugar-cane, from the axis of the stem to the second row of the most woody fibres.

"These cells in the ripe Sugar-canes become yellow when washed in pure water and placed in contact with iodine, and the colour is heightened by the application of sulphuric acid, which disunites the cellulose.

"When, however, the azotised matter in the small thin-sided vessels, and also the azotised and woody substances in the cells containing sugar are removed by caustic soda, several curious phenomena are produced under the double reaction of the acid and iodine; the small pitted vessels whilst disuniting become tinged with a light blue.

"The interior of the sugar cells, the part last formed, swells rapidly, and passes to the state in which particles of disunited cellulose are found in hydrated starch. This part then, of course, is coloured deep blue. The azotised corpuscles adhering to this inner layer separate from it, and are distinguished by the peculiar orange colour of the light granular outline which they form parallel to the inner swollen sides of the cell.

"The outer membranes, those first formed, being more compact, are not so much disaggregated; they swell, however, form sinuous folds, and separate at places from the neighbouring cells, but still retain the orange-yellow colour they acquired under the influence of the double chemical action.

"If a thin slice of the Sugar-cane, after being washed in pure water, is acted upon by a solution of caustic soda or potash, all those parts of the tissues which contain woody matter turn yellow, whilst the little pitted vessels and the cuticle become semi-transparent and colourless. This shows that the latter parts contain no woody matter at all.

"The yellow colour thus produced by the alkaline reaction disappears altogether if the parts so coloured be washed with pure water and are then placed in contact with an excess of acetic acid. This acid renders the field of the microsope very brilliant.

"If the action of caustic potash or soda on a thin slice of the cane be heightened by evaporating the alkaline solution nearly to dryness, and the slice be then washed, it will be seen that the woody bundles have been completely separated the one from the other; the same thing happens to the little pitted vessels, which do not occupy the space they did previous to the experiment. All the other parts of the tissue when separating under the action of iodine and concentrated sulphuric acid are coloured indigo blue, whence it appears that they consist of pure cellulose.

"The cellulose of the tissues of younger and less ripe canes can be purified much more quickly and by much weaker reagents. Indeed if a thin slice of the middle of the stem of a green Sugar-cane, only one-third grown, be taken and treated with—1, pure water; 2, a solution of iodine in water and alcohol; and 3, with concentrated sulphuric acid, the epidermis and the cellular tissue lying next under it become coloured with deep orange; the woody fibres become separated, and together with the large pitted vessels (of which there are two in every woody bundle) take and keep an orange-yellow colour; the small pitted vessels turn greenish blue and separate quickly; whilst the sugar cells pass from yellow to green, and then indigo violet, swelling and separating little by little.

"A portion of the lower white part, which was completely enveloped by the sheathing leaves of a young Sugar-cane, and the woody tissue of which was still tender, was subjected to the same reagents. Iodine dissolved in water coloured the whole of its tissues, except the small pitted vessels, yellow; the addition of a drop of sulphuric acid produced a most curious and pretty effect; the outer hairs, yellow on their external cuticle and their internal granular membrane, became violet in the thickness of their swollen sides; the cuticle and epidermis of the stem acquired a deep orange tint, the subjacent cellular tissue was tinged blue in the thickness of all its cells, and the same tint was visible in the small pitted vessels, so that there was a blue cylindrical bundle surrounded by orange-yellow tissue, thus; 1st, there were the large pitted vessels with the 14 or 18 tubes adhering to each of them; then came the fusiform tissue over-lying them; and 3dly, the slightly woody fibres. In the middle of the yellow sides of the latter could be seen the inner layer of recently formed cellulose detaching itself in an irregular swollen blueish ring.

"The cells of tissue still younger than the last had all of them a roundish or elliptical nucleus of delicate azotised tissue, the diameter of which was about one-tenth of that of the cell; a quantity of granules of azotised matter adhered to the inner surface of all the cell walls. Numerous but excessively small grains of starch were visible; successive additions of iodine and sulphuric acid stained the epidermis; the woody bundles and all the azotised bodies permanently deep yellow; all the tubes, vessels, and cells swelled, became dark violet-coloured, and separated from each other; the dissolution soon becoming more complete, the blue sides disappeared, bringing into view the isolated brownish-yellow epidermis and all the orange-yellow azotised corpuscles which adhered to the interior of the destroyed cellular membranes.

"Thin slices of a lateral bud whose leaves were only about an inch in length, when treated in a similar way, exhibited a bright orange-yellow colour in the epidermis of the leaves and the axis, whilst all the rest of the tissues rapidly became violet-coloured whilst being decomposed.

"Lastly, all the stems and leaves of newly-formed shoots contain a great quantity of starch granules. Starch occurs in the stems principally, in the tissues lying immediately beneath the epidermis, and in the cellular tissue containing sugar situate all round the vascular bundles. The leaves also contain large quantities of starchy substances situate in the firm cellular tissue surrounding the vessels of the nervures, and extending from one face of the leaf to the other.

"It has been ascertained by chemical analysis that a green cane contains half as much sugar, 30 per cent. less tissue, and three times as much organic substances and salts as a ripe one. Similar differences would no doubt explain the impossibility of extracting cane sugar with any profit in countries where, in consequence of the coldness of their climates, the cane cannot become sufficiently ripe; for it is certain that organic matters and salts present great obstacles to the crystallisation of sugar.

"The nodes of a Sugar-cane are composed of a compact tissue consisting principally of thick-sided woody fibres, in which the cavities of the cells are, in consequence of their thick sides, small, and where, besides, the cells containing sugar are much smaller and less numerous than elsewhere. It is easy to understand, then, that the quantity of sugar in the nodes themselves is only about half that found in the other parts of the stem.

"Another fact, at first sight remarkable, but which might have been anticipated from the structure of the nodes, is that they contain as much water as all the other parts of the stem put together. This is because the larger quantity of cellulose and woody incrusting matter in some parts is compensated by the smaller quantity of sugar in other parts of the nodes.

ON THE CULTIVATION OF THE PINGUICULA ORCHIOIDES.

By C. D. Bouché, Inspector of the Royal Botanic Garden of Berlin.

The cultivation of bog plants is always attended with more or less of difficulty, as is that of the Pinguicula orchioides, an elegant little plant, whose rather fleshy leaves are spread on the ground, in the form of a rosette, from the centre of which spring, in the course of the summer, several stalks of from 4 to 6 inches in height, bearing single violet-coloured highly ornamental flowers. It is a native of the swamps of the southern states of North America.

The soil on which this plant thrives the best consists, for the most part, of Moss, mixed only with a little of some kind of light earth, rich in humus, peat earth being

the best; and in order that the somewhat slimy foliage may not be soiled by sand, or other extraneous particles, I cover the pot with living Moss (Hypnum). As the roots do not extend far, flat 4-inch pots are large enough; but I put these within other flat pots, 8 to 10 inches in diameter, and I completely fill the interval with living Moss. I put an 8 or 9-inch bell-glass over the whole, and I place underneath it a pan, kept full of water, in order that the pot may constantly imbibe moisture, so as to become saturated. For the summer, the plants are best placed in a pit in the shade, without bottom-heat, with the lights open night and day. In the winter they should have a light situation, close to the glass, in a greenhouse of about 8° of temperature.

In order that the water may not become putrescent and injurious to the plant, the Moss between the pots should be well purified about once a week, by copious aspersions of clean water allowed to run through, and off at the bottom.

Treated in the above manner, some specimens of this charming plant attained, this summer, a diameter of 6 inches, and flowered abundantly.

During the winter the larger leaves die off, whilst smaller ones are formed, closely folded over each other, into a bud of 1 inch, or 1½ in diameter.

The plant is increased by division, as it usually separates naturally, after flowering, into several. The best time for planting is in March, before the larger summer leaves are developed.

NOTES OF A TRAVELLER.—No. XIII.

Chinese Nursery Gardens at Shanghae.—In my last letter I gave you some account of the English gardens at Shanghae, and shall now describe some of the Chinese nursery gardens of that place. At Shanghae, although a place of great trade, few rich men reside; and consequently there are none of those pretty mandarin's gardens which are met with in towns like Ningpo. But its nurseries are places of great interest. About two miles from the south-west corner of the city there is one which is now well known to foreign residents as the "South Garden." It was one of those in which I found many new plants on my first visit to China. When I reached Shanghae this time, I took an early opportunity of paying a visit to the garden, and my old friends to whom it belongs.

"Ah, you have come back;" "Are you well?" "How did the plants get home?" "Were they much admired in England?" were the questions which were rapidly put to me by the old nurseryman and his sons; at the same time they brought a chair, and asked me to sit down under the awning of the cottage. I told them that most of the plants had arrived safely in England, that they had been greatly admired, and that the beautiful Weigela had even attracted the notice of her Majesty the Queen. All these statements, more particularly the last, seemed to give them great pleasure; and they doubtless fancied the Weigela of more value ever afterwards.

This little garden covers about an acre of land, and is surrounded, like many of these places, by a ditch, which is connected with canals through which the tide ebbs and flows twice a day. On entering the gate, the first object which one notices is the gardener's house. It is a rude building of one story, and contains the old couple, two sons with wives, and a large number of young children. The Chinese in the country live always in little colonies of this description. When a son marries, the wife is brought home, and a portion of the building is set apart for their use. Here they live together in the most harmonious manner, and the grand-children, when they grow up and marry, occupy a part of the same buildings, rarely leaving the place of their birth.

Having first accepted the kind invitation to sit down and sip the national beverage in Chinese style, I then led the way into the garden. Here are many of those beautiful plants introduced by the Horticultural Society of London from 1843 to 1846. Amongst some pots at the entrance there were nice plants of the now well known Weigela already noticed, the pretty Indigofera decora, Forsythia viridissima, and a fine white variety of Wistaria sinensis. Round the sides of the ditch just mentioned were many magnificent specimens of Edgeworthia chrysantha, and Gardenia florida Fortuniana, growing in the open ground. Some of the Gardenias were 4 feet high and 15 feet in circumference. When covered with its large Camellia-looking blossoms, it looks extremely handsome, and at all times forms a pretty evergreen bush. In a bed in the middle of the garden, the star-like white variety of Platycodon grandiflorum was in full bloom, and near it another bed of Dielytra spectabilis. Both these looked very handsome, particularly the latter; its large purse-like blooms of a clear red colour, tipped with white, and hanging down gracefully from a curved spike, and its mountan-like leaves render it a most interesting plant, and one which will become a great favourite in English gardens. Several kinds of Roses were growing in pots, and amongst them the new yellow, or salmon-coloured, introduced by the Horticultural Society. This Rose deserves more notice at home than it has yet had; and it will have it, when it is better known and properly treated. It should be planted out at the foot of a wall with a southern or western aspect, and allowed to scramble over it. It grows rapidly; the flowers are of a striking colour, and are produced in great profusion. Nice plants of Viburnum plicatum, and V. macrocephalum, were also noticed, both in pots and also in the open ground.

In this garden there are some young plants of a very interesting species of Palm (Chamærops), which is cultivated largely on the most exposed sides of hills in the provinces of Chekiang and Kiangnan, for the sake of its bracts. They are cut or pulled off at certain seasons of the year, and used in the manufacture of ropes, cables for junks, cloaks and hats for agricultural labourers, and for many other useful purposes. If a plant of this description prove hardy on our English hill-sides it would be a most remarkable object, and there is every probability that it may be so. At all events it is well worth a trial, and for this purpose I sent a case of young plants to Sir Wm. Hooker for the Royal Garden at Kew last year. Even if it should not succeed in the valley of the Thames about London, it might in the south of England—say in Devonshire or Cornwall.

In the centre of the garden I am describing, there is the family tomb—a large mound of earth covered with many pretty flowers. Here the old man's fathers for many generations before him lie buried, and here he will sleep among the flowers he loved in his lifetime.

Amongst shrubs and trees which have been longer known than those I have enumerated, this garden contains a good assortment. There are some beds of Reeves' Spiræa (S. Reevesiana), a beautiful shrub; the Chinese Juniper, Hibiscus syriacus, Glycine sinensis, Lagerstrœmias, Peaches, Plums, and the favourite La-mae (Chimonanthus), with which Chinese ladies decorate their hair.

I had now made the circuit of the garden, and came to the little wooden bridge by which I entered, and to the gardener's house. "Sit down and drink tea," said my kind friends, bringing me another cup of the pure beverage, for which I thanked them, and readily accepted their hospitality. Having rested, I then walked onward to the Moutan Gardens, about three miles farther off. But I must reserve my account of these until my next letter, as I have already made this one, I fear, too long. *R. F.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND; OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

Culture of the Mind.

The greatest failures, the bitterest disappointments, and almost all absurdity of conduct, arise from the imitation of those we cannot resemble.

A man thinks he can manage a farm or govern others, when he cannot cultivate a garden or govern himself; but if each man does his duty, whatever it may be, well, he will then show his capacity, and create an opportunity of doing more; but no man in any station can, as perfectly as it may be done, perform his duty therein.

You cannot make a silk purse out of a sow's ear.

No. V.—The exact form of training need not be retained, so long as the principle is observed.

Although I have only hitherto described a vertical stem with horizontal arms, yet this form need not be strictly adhered to, if only the young shoots of one year's growth be trained to bear the next, and so on. For instance, the stem might be vertical and the rods trained horizontally. Or, with a wall of only a few feet in height, the Vine might be trained in the form of a fan; but with the shoots still as horizontal as possible.

Or again, if you have a wall 20 feet high, a gable end or quoin, for instance, you should have two Vines; one to cover the lower 10 feet (for the rods will not ripen their wood to a much greater height), and one with a clean stem of 10 feet before its horizontal arms are formed, to cover the upper part of the wall. But if the surface of the wall be very much broken, and it becomes difficult to pursue this manner of training, it were better, perhaps, to try the spur method (the usual plan adopted), which is this: Fill the wall with wood, and in the autumn cut back all the young wood of the year's growth to two or three buds; and this shortened shoot is called a spur. But even in this case I should recommend a constant removal every two or three years of the wood from which the spurs spring. *C. A.*

BRITISH SONG BIRDS.

No. VII.—Building a house is tedious work. Day after day the operations go on, but with little or no present visible progress. Still, everything must have a beginning; and no house can be properly erected without first laying a foundation. Thus have I acted, in the treatment of my subject; bearing in lively remembrance the notable remark of Mrs. Glass, of immortal memory, than whom I wish no brighter nor better example to imitate.

If I have, perchance, been dry, prolix, and precise in my matter-of-fact directions, it has been with the single view of paving the way for the better enjoyment, hereafter, of the work of our hands. The benefit derivable from an attentive perusal of apparently minor matters of detail, will soon become evident, nor is the "marrow" of our subject even now far distant.

I come now, *pari passu*, to the discussion of "How to store an aviary." This is a matter which requires no little judgment; for if birds, by nature quarrelsome, were admitted indiscriminately to congregate under one roof, the result would be anarchy, confusion,—bloodshed.

The names of the principal intended "settlers," may be given as follows:—Aberdevines, bullfinches, chaffinches, canaries, goldfinches, linnets, redpoles, twites, yellowhammers. The foregoing are hard-billed, granivorous, or seed birds.

The soft-billed, or insectivorous birds, are thrushes, blackcaps, arbour-birds, cole-tits, blue (or Tom) tits, marsh-tits, garden-warblers, hedge-sparrows, nightingales, redstarts, reed-sparrows, stonechats, whinchats, titlarks, woodlarks (no sky-larks must be admitted), whitethroats, wagtails.

From the above list, it will be seen that blackbirds, the ox-eye, robin, and wren, are excluded. The three first are quite inadmissible,—blackbirds being spiteful and malicious; ox-eyes, or joe-bents, murderous assassins.* The latter often feel an inclination to look too closely into the phrenological development of their neighbour's head. There could be no reasonable objection to this, if it were done from a laudable curiosity, and "in a regular way." But their invariable *modus operandi* is,—first to split the skull of their "subject" (*à-la*-woodpecker "tapping");" then to examine its contents; and, finally, to devour it greedily. This remarkable operation, frequently repeated, would, I hardly need say, soon depopulate the aviary.

The robin, or redbreast, must be regarded altogether as an alien—such is the ferocity of his natural disposition. Who would credit this, when viewing him seated aloft, on the highest twig of yonder tall tree; every nerve visibly agitated, and his little throat widely distended; while, in the joyousness of his nature, he is pouring forth the "most eloquent music?" Does he not look a perfect paragon of harmlessness, virtue, and innocence?

Such is he NOT. In him may be traced the unerring principle of Nature; for every specimen of his tribe—in *this* "rule" there are NO "exceptions"—is invariably alike in disposition, tyrannical, despotic, jealous, sanguinarily cruel. When noticing the "habits" of this bird, under its proper head, I shall have much that is interesting to dwell upon—much to record that I have never heard of, nor seen noticed by naturalists. I dearly love the rogue, aye, dearly; but, as a faithful historian, I dare not give him "a false character."

The wren is excluded, because he is a very tender, delicate bird, in confinement; impatient, also, of the constant bustle and excitement inseparable from an aviary. If ANY of this tribe be admitted, let it be two or three willow wrens. They are an exquisitely-formed bird, minutely small, and the most lively of their race.

The excess of numbers should be in favour of goldfinches, linnets, canaries, redpoles, and bullfinches. These birds are "showy" as well as sprightly, and are scarcely ever "mopish" in an aviary. Thus do they, by their activity and playfulness, keep the inmates in a state of constant jollity. *William Kidd, New Road, Hammersmith.*

VILLA AND SUBURBAN GARDENING.

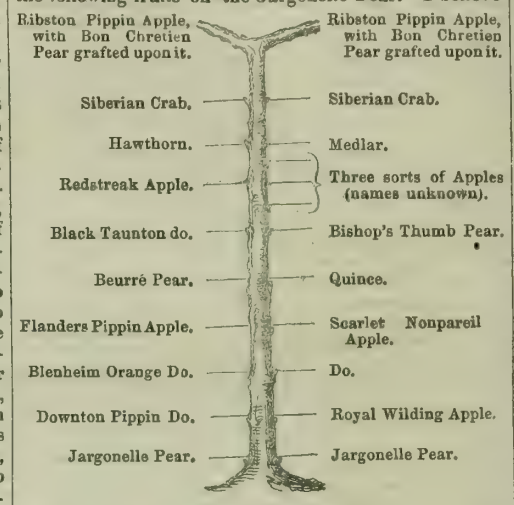
As spring opens upon us, our hearts gladden at the sight of her first floral contributions; and if we could only get the same feelings to jog our memories at other periods of the year, our gardens would not unfrequently yield us much more enjoyment than they usually do. I shall, therefore, on this occasion, remind my readers of a few of those early flowering plants, common, not costly, yet not less beautiful on that account, which, if just looked after at the right season, when they exhibit few attractions, will, in due time, prove acquisitions.

The varieties of common Primroses are easily obtained; and as regards fragrance and simple beauty, few plants are more desirable, for they grow almost in any situation in which they may be placed. Then the Christmas Rose, and winter Aconite, together with the Snowdrops, thrust their heads through the snow, and cheer our hearts, even although the ground may be enshrouded in a white mantle. The well known Pansy (Viola tricolor), if sown in autumn, will add a pleasing variety to any garden, and without the trouble and coddling which the florists' varieties require. Then there is the common Polyanthus, with its hundred kinds, which a packet of seed, at little expense, would produce; and what lover of sweet flowers would be without them?—as well as the Cowslip, and common Wallflower? Again, Old Queen Stocks, as gorgeous flowers, are unsurpassed; and the Gentians and sprightly Hepaticas are humble, but beautiful. Narcissi, of themselves, would make a spring garden gay, though, of late years, they seem to have disappeared almost entirely; and so have the charming little Scillas, which form beautiful beds. These few old and common plants, with little or no attention, might be made to render our gardens beautiful through the earlier months, when little meets the eye, but bare stakes and cheerless borders. The great effort of modern gardeners is the production of a blaze of flowers during the summer and autumn months. In a multitude of cases, the borders and beds are cleared on the first appearance of frost; they are then turned over with the spade, and left in this naked condition, until all apprehensions of spring frosts are gone. Now, it has often occurred to me, that only half the use, and less than half the pleasure of the flower garden is thus afforded us; the extra trouble, and small expense of adding another and a more charming season of floral beauty is within the reach of all who possess a garden. The plants above enumerated, and many more that might be named, would cost nothing compared with the sum which some amateurs expend upon half a dozen favourite florist flowers. The great rage for the latter, indeed, has banished a purer taste from amongst us, and rendered

* There is only one phrenological organ in the head of an ox-eye. It is the organ of "murder." Thus is he predestinated to fulfil his deadly mission, and thus is the truth of the "science" triumphantly confirmed.

our gardens bare of more interesting flowers. Except during the dog days, many of our gardens contain little to induce the individual of refined ideas, or the weakly in constitution, to leave their rooms for the enjoyment of a garden on a mild spring morning. The visitor returns chilled, and with a morbid impression that winter still prevails. None of the spring favourites of early youth are to be seen. All that belongs to the flower garden is cooped up in frames and greenhouses; but then there can be no good reason why the garden should be at least six months of the year in fallow. *Pharo.*

Home Correspondence.



Select Plums.—I have in some degree laid myself open to misapprehension, in the observations I made a few weeks since upon the best sorts of Plums. In saying that the Plums there named are all that a gardener need cultivate, I did not of course mean to exclude new seedlings or imported varieties which I had never seen, and consequently could not know anything about. Mr. Rivers's seedling from the Precoce de Tours may possibly be a great improvement upon its parent, which I recommended because it is the best very early Plum that I am acquainted with—a great desideratum to a gentleman's gardener who has to furnish a certain number of dishes of fruit every day for dessert. Every one of the other kinds I named would be preferred to the Precoce de Tours if they ripened at the same period; and if the "Early Prolific" of Mr. Rivers is equal to it in earliness, and so superior in every other good quality as "R." represents, it is much to be regretted that Mr. R.'s seedling has not been made more generally known. It seems that I underrated the Reine Claude de Bavay, which in my ignorance I supposed to be little known in this country, and therefore thought that a notice of it by a disinterested person might be useful to fruit growers. Had I been aware that it had fruited so frequently in England, as to warrant "R." in stating so confidently, that "south of the Trent it ripens as nearly as possible, allowing for the variation of our seasons, from the middle to the end of September," I should not have noticed it. But is it not rather singular that a Plum which must have been gathered in the first week of October, in the vicinity of Paris, should generally ripen in England (we will suppose near Sawbridgeworth), a fortnight sooner, especially as the difference of climate in favour of Paris is, I understand, a week or ten days. With the view of clearing up this discrepancy, I have caused some inquiries to be made concerning the usual time of ripening of this Plum, from the person who sent the fruit to England, but have not yet received an answer. I beg to assure "R.," however, that I have no desire to disparage the Reine Claude de Bavay; and if, upon a better acquaintance with her Bavayan majesty, we find that her merits have not been exaggerated, then I shall say, "Long may she reign over us." The mere anticipation of a Plum superior in flavour to a Greengage makes one's mouth water. As to the Queen Mother Plum, the large kind I alluded to was not supposed by me to be that variety, but by the person from whom I received it, and I understand that it was obtained from a nursery under that evidently erroneous name. It is more in the way of the Red Magnum Bonum, but apparently quite distinct from that sort. I am promised grafts of both the large Plums I mentioned, and as "R." is evidently well informed in the matter of fruits, I will willingly send a shoot of each (provided I get them), for him to any place in London he will name. I cultivate Coe's Late Red against a wall (where also most of my Plums are grown), and find it useful on account of its extreme lateness; in other respects it is not worthy of being named in the same day as his Golden Drop. The "Zwetsche" (what an awful name!) I am unacquainted with. I have recurred to this subject, because I consider the Plum one of the most useful fruits cultivated in a gentleman's garden. In a fresh state it is valuable for dessert and for tarts; it makes an excellent confection when dried; and for jam, it is superior to either the Gooseberry or the Strawberry. Can as much be said in praise of the Peach? *J. B. W.*

Irish Peat Charcoal.—"H. P." complains (p. 741) of damage done to the leaves of his Cucumber plants by the exposure to heated air of charcoal steeped in urine. What other result could he have expected if he had reflected for a moment on the agent which he employed? It was known to our great grandfathers that urine is destructive to the leaves and stems of plants when poured upon them, and it must be evident that the gases of urine evolved by heat are alike injurious to vegetation. In proportion, however, to its evil influence on the foliage is it beneficial to the roots, if applied at proper seasons and diluted with 3½ gallons of water to half a gallon of urine. The peat charcoal had nothing more to do with the matter than a sponge used in a similar manner would have had; and I should advise "H. P." to place as much of the charcoal as possible on the surface of the mould, as a means of purifying the air, and thus assisting in restoring the injured foliage to health; but it must be unsteeped. *C. L., Hammersmith.*

Fuchsia spectabilis.—In addition to what was stated last week concerning this plant, I have thought it might be useful to give its treatment from the cutting state upwards. I strike my cuttings under a bell-glass in the coolest part of a greenhouse; the glass being taken off and wiped occasionally. When struck, they are potted off into three-inch pots. In the end of June they have a shift, and they receive another in the end of September, after which they grow all winter. In the beginning of March they have another shift, and receive the final one in the beginning of May. In the end of May they are placed out of doors in an east aspect, where they receive the morning sun till 10 or 11 o'clock, and afterwards stand in a half shade the remainder of the day. The soil which I use is half loam and half crushed bones, old Mushroom dung, and sand, using it in a finer state for cuttings than for older plants. I apply the same treatment to all my large Fuchsias. At the end of the season they are all thrown away, and a young stock is reared every spring; observe, however, that F. spectabilis makes a splendid winter plant for the conservatory, for which purpose shorten the side branches back in autumn, and do not expose it too much to the rays of the sun. In last week's number the word sand was misprinted soot. *D. Kidd, Garnstone Park.*

Cyrtoceras reflexum and multiflorum.—I beg to inform "T. B" that these plants are easily cultivated, and with good management flower a long time. Take a young healthy plant in January; if it requires cutting down, to make it bushy, do so; place it in a moist stove, and keep it rather dry at the root until it has broken well, then give it a liberal potting into three parts Wimbledon peat and one part leaf-mould, with a good mixture of white sand and plenty of drainage. After potting, give a good watering, and place your plant in a bottom-heat of 90°. Let your stove range from 80° to 90° by day and 70° at night, keeping it well charged with moisture in the daytime. When the plants have grown from a foot to 18 inches, gradually remove them from the bottom-heat and place them away from currents of air. Be cautious in not over-watering. If you follow these instructions your plants will reward you with a profusion of flowers and fine foliage. *A Subscriber.*

Grafting.—An ingenious young friend has grafted the following fruits on the Jargonelle Pear. I believe

they all bore fruit this year. *F. D., Pershore.*

Vines.—I have a greenhouse, in which all the Vines bore fruit last year, but this year five of them have not, and the leaves of these five are still green and flourishing, while on the others they have died off as usual. I shall be thankful for any advice that might enable me to remedy the evil next year. *H. M., near Worcester.* [It is impossible to give an opinion without knowing more of the circumstances. Where are the roots of these five luxuriating so late in the season?]

Vine Borders.—As to the condition necessary for the successful cultivation of Grape Vines, gardeners are almost unanimously agreed. According to Dr. Lindley, these conditions are a warm, light, dry, shallow border; or in other words (and which may perhaps allow of less latitude of construction), a well drained porous border so situated as to receive the full influence of the sun. But although nearly all gardeners agree on these points, yet the means employed to obtain them are almost as universally opposed to each other. To this fact your columns bear ample testimony. In making a border, the first object should be to obtain a dry bottom, or such as will carry off water as fast as it percolates through the superincumbent soil, and in some measure prevent the roots from going into the subsoil. In some situations this latter is a point of no small importance. My method, in all situations, would be to dig out the border to the depth of 1 foot, shovelling out the loose soil so as to leave a solid bottom. On this I would put 6 or 8 inches of fine gravel, ramming it well as it is put in, until it becomes quite hard. In front and parallel with the border, there should be a gravel walk the depth of the border, and having a drain in the middle lower than the latter, and, if circumstances admit of it, the border would be improved by the same provision being made at each end of it. By this arrangement perfect drainage, as well as the greatest amount of terrestrial warmth would be secured, at least as far as they could be without artificial heating, and the roots would not penetrate through such a bottom to any extent detrimental to them. Though to many my method may not appear different from the common practice of bottoming with loose rubble, such as broken bricks, lime rubbish, &c, yet its effects are very dissimilar; firm gravel equally resists the penetration of roots with concrete, whilst, unlike concrete, it offers no resistance to free drainage. The size of border will be determined by circumstances; but, in making a border, it should be borne in mind that some reciprocity between root and branch is to be maintained, consequently the size should be proportionate to the extent of surface to be covered by the branches of the Vines. The next thing to be considered is the soil; and as I have no faith in quackery of any description, more especially in the cooking of soils (if I may be allowed the term), I shall not trouble your readers with anything very elaborate on this point. Its mechanical texture and arrangement is, in my opinion, of far more importance than any other qualities it may possess. [Hear, hear.] Let turf be taken off some old pasture, 4 or 5 inches thick; but, if the land is very strong, it should only be about half that thickness. It should be procured in dry weather, two or three months before it is required for use, and stacked so as to throw off wet. I find this a much better plan than putting the turf in, in a green state. When used, it should be chopped with a sharp spade from the top to the bottom of the heap, each cutting being about 4 or 5 inches broad; by this practice the border will be more uniform in texture than if the turf was put in, in larger pieces. Add to this some good stable dung, mixing all well together in the operation of filling, and this will be all that is requisite. Even the latter I do not recommend for its fertilising properties (as I always prefer applying manure in a liquid state, for in that state only can it be applied discriminately to permanent things such as Vines), but to prevent the running together and baking of the soil. The border should be filled with from 18 inches to 2 feet of this compost, putting it in, in layers about 8 inches thick, and treading each layer as it is put in, so as to make the whole tolerably firm. If done in dry weather, where there is a difficulty in obtaining turf, common garden soil may be mixed with the latter, to the extent of one-half of the whole mass. *D. M.*

——The plan of managing Vine borders propounded by "T. W., Motherwell," p. 709, contains nothing new. It has been in use a much longer period than the system which he condemns. It was practised during my service under the late Mr. M'Donald, gardener at Dalkeith Palace (whose superior knowledge in these matters is well known), 15 years ago, with this addition, viz., there were always some rotten leaves and vegetable mould forked in to keep the top of the border porous, and to prevent the frost from injuring the roots. But the forking up of the borders was not only attended to in the autumn, but through the summer also, which is of more importance than merely stirring in autumn. Great advantage was also derived from the use of liquid manure and soap-suds, when the Vines were in a growing state, but we always avoided cold water from a sunk well. I have followed the above practice for many years, and with great success. I am of opinion that if the roots have not 6 inches of earth upon them, frost will hurt them, and tend more to induce shanking than the evils alluded to by "T. W. M." In early forcing it is essential to have the borders covered with warm dung, in order to assist the roots. Having formerly given a description of the plan I adopted in the formation of my Vineries and Vine borders, when residing at Tynemouth House Gardens (see p. 358, 1847), and having followed out the same system here, I will merely at present give some account of the kind of crops I have obtained, notwithstanding the severe check which the Vines received in their removal from Tynemouth to Pallinsburn House, three years ago. Last year the number of bunches amounted to 120, averaging in weight from 2 to 3 lbs. each; this year the bunches amounted to 250, from 3 to 4 lbs. each; and many of the Black Hamburgh berries measured from 2½ to 3 inches in circumference. Some of the white Muscats did not swell off so well as might have been wished, having allowed too many bunches to remain after thinning. I am convinced that if cutting away the bunches was as much attended to as thinning the berries, we would see better swelled Grapes and finer crops in future years. *Robert Greenfield, Pallinsburn Gardens, Northumberland.*——I have read with interest the judicious remarks on concreting Vine borders, and on badly-coloured Grapes, by Messrs. Fleming and Kidd; but in case some of your readers should imagine that an impenetrable bottom, artificial or natural, for the roots of Vines, is requisite to successful Grape growing, I can state from experience that a loose poor sandy subsoil will produce equally good Grapes. I also find that it is of little consequence whether the roots of Vines are higher than the common ground level or sunk below it, or whether the rays of the sun strike the surface where the roots are or not. What is absolutely necessary is a dry bottom. In regard to dull red or crimson-coloured Grapes making their appearance at times, I can venture to assert that they will do so in some instances, independent of concrete, loose sandy subsoil, or any other appliances, either at top or bottom, however skilfully applied. My opinion is, that red or crimson-coloured Grapes appearing one year, and black another, on the same Vines, is perfectly natural; the cause is cultivating indiscriminately a variety of the Black Hamburgh, called by some the Dutch Hamburgh, but generally named the Black Hamburgh, which, I have no doubt, is a misnomer. Do not, however, let me be misunderstood; unfavourable soil will often produce badly-coloured Grapes, and so will over-cropping, want of air, sometimes too much air, and various other mismanagements, which, probably, very few that have had Vines under their charge, have steered clear of, at some time or other. *G. M., Wetherby, Yorkshire.*

Rendle's Price Current.—There is one fault in

this publication, which is, that it is a "Price Current without the Prices." Excepting German flower seeds, four collections of kitchen-garden, and three of flower-garden seeds, not a word is said of what is to be the demand. Surely, this is an important omission, and a check to purchasing. *Sigma.*

To Protect early Peas from Mice and Birds.—A tenant of mine, who grows early Peas, informs me that, if he sows the seed in rows and covers it with the next spit of soil, as he digs the ground (after the garden method of planting Potatoes), instead of digging the whole and then drawing drills, neither mice nor birds ever discover the Peas. This method, he remarks, not only avoids betraying the position of seeds to the vermin, but also leaves the ground untrodden after digging. *Sigma.*

Water Pipes.—Your clerical correspondent will, I am afraid, find considerable difficulty in procuring the information he wishes, through the medium of your columns—unless he furnishes more data than he has yet given. Having had some experience in carrying out water-works, I, however, venture to offer him a few suggestions. In the first place I would recommend that samples of water be procured from all the sources of supply that are eligibly situated, that is within the shortest distance, and of suitable elevation. These samples should be tested by C. Clark's method of determining the degree of hardness, and those of the lowest number of degrees, denoting the softest water, preferred. Next, the amount yielded by these selected sources should be ascertained by gauging them, and sections taken to those that are sufficient in amount, due regard being paid to seasons of deficient supply. If the distance be considerable, the water should be brought in glazed earthenware pipes, from the spring to the nearest site eligible for a reservoir, and the water from thence laid on with iron pipes. If ample pressure can be obtained, the reservoir should be placed at such height as to render the water available in case of fire, by the insertion of fire plugs at suitable places. The additional cost this will occasion is trifling compared with the benefit of having the best protection from fire. If the supply be at all times adequate to the demand, the reservoir need only be small; if not so, it must be proportionately large, as the supply is liable to diminish. By conducting the water from the spring in earthenware pipes with cemented joints, the water will at all times be free from surface impurities. The actual size of pipe required can be ascertained only from a section of the ground showing the length, fall, and vertical undulation it may make in its course. The size will also be affected by any horizontal bends it may be necessary to give the pipe in laying. These, together with the amount of water required to be delivered in a given time, are requisite before its size can be determined. The smallest sized glazed earthenware pipes (those of 2 inches internal diameter) might be laid. I have used these in the manner recommended, for supplies similar in extent to those required by your correspondent, and found them not only perfectly efficient, but also economical. In laying these pipes a regular descent should be obtained, if practicable, in order that they may not have to sustain pressure. With regard to the selection of pipes, those of glazed earthenware and cast-iron are to be preferred. If inverted horse-shoe tiles are used, as suggested by one of your correspondents, the water will be muddy after showers. An instance recently came under my notice of earthenware pipes laid in puddle, but without cemented joints, having the water flowing through them fouled by surface water making its way through the joints. Suppose that $1\frac{1}{2}$-inch bore pipe is required, the cost will be about 1*s.* 10*d.* per yard, cast-iron, jointed; 3*s.* 3*d.*, glass, jointed; 3*s.* 3*d.*, gutta percha; 4*s.*, lead; and 1*s.* 3*d.*, glazed stoneware pipe, 2 inches diameter, with cemented joints. These prices will vary a little in different localities. Lead is not only objectionable on the score of expense, but is decidedly injurious where pure water has to be conveyed. The purer the water the greater the danger in the use of lead piping. Gutta percha, where expense is no object, may be used; it will bear a considerable pressure. A $\frac{3}{4}$-inch bore tube, $\frac{1}{8}$-inch thick, has been tested with about 750 feet pressure, without failing. Glass pipes will bear a pressure that is almost incredible. From experiments made at Nailsea, glass tubes, 3 feet long, varying from $1\frac{1}{8}$ to $2\frac{3}{4}$ inches internal diameter, with thicknesses of from $\frac{1}{11}$ to $\frac{3}{16}$ of an inch, bore pressures of from 1500 to 3600 feet. Hitherto there has been considerable difficulty in making a tight joint with glass tubes. In conclusion, the best advice I can offer your correspondent is, that he should call in the services of some civil engineer, by which means he will best secure efficiency without incurring needless expense. *J. M. L., Otley, Yorkshire.*

Mossy Walls.—Having some walls under repair that are covered with an ash-coloured hard moss, which it is desirable to remove, can any of your readers inform me if anything can be applied to destroy or loosen it, and cause it to sweep off effectually, thereby avoiding the labour and expense of scraping? *Durham.*

Societies.

Botanical of Edinburgh, *Nov.* 14.—The President in the chair. The Curator gave in a report on the state of the Herbarium, noticing that considerable progress had recently been made in the arrangement of the collections, and that four additional cases had been obtained. Several important additions of foreign plants were likewise noticed. The following papers were read:—

1. *On the British Species of Carex.* By J. M Laren.
2. *Notes of a Botanical Trip to England.* By J. T. Syme.
3. *Notice of the Discovery of Saxifraga Hirculus, in Boovland Moss, Walston, Lanarkshire, in September last.* By G. J. Blackie.

Dr. Balfour noticed the discovery by Mrs. Balfour, in August last, of Ginannia furcellata, of Turner, in Lamlash Bay, Arran. This is the first Scottish station for the plant. The Rev. Dr. Landsborough has subsequently received this species from the same station, dredged by Major Martin, Ardrossan. Specimens of the plant in fructification were shown both in the dry state, and preserved in creosote; and some were exhibited under the microscope. There was exhibited from Mr. C. Lawson a large plant of Tussac Grass, grown in Orkney. Some recently-received tufts of this Grass, when fresh, weighed about 1 cwt.—Dr. Balfour exhibited specimens illustrating the production of vinegar. No. 1 was the so-called Vinegar plant, with vinegar produced by it. 2. Syrup into which the plant had not been introduced, but which had been left for four months undisturbed. In it a peculiar fungus-like growth similar to the Vinegar plant was found, and the fluid had become vinegar. 3d. A specimen of vinegar produced by Vinegar plant which had been filtered, and then allowed to stand for several months, and in which a fungus similar to that called the Vinegar-plant had been formed. Dr. B. thought that the so-called Vinegar plant must be considered the mycelium of some fungus produced in a peculiar fluid, and which acted as a ferment. The addition of any ferment would probably cause a similar production of vinegar.—A peculiar forked variety of Lastrea Filix-mas was exhibited by Mr. Anderson, which he had picked in the neighbourhood of Clonmel.

Garden Memoranda.

Hatfield House.—The greenhouses and pits adjoin the reserve garden, and are principally employed for the propagation and preservation of bedding out stock, of which, as was stated last week, a large supply is required. The forcing garden is detached from all others, and is situated a few hundred yards to the north of the mansion. A considerable space of ground within the walls, independent of that occupied by glass structures, is appropriated to the cultivation of Strawberries, which are planted on broad beds, raised nearly 4 feet above the level of the garden—a method which increases the available space, and causes an earlier and equally abundant production of fruit.

The range of forcing-houses includes three large Vineries, and two Peach-houses. The Vines are planted within the houses, and grown on the rod and spur system; from these Vineries a regular supply of Grapes is obtained, from May until February of the following year. The sorts are black Hamburgh and Muscat of Alexandria, with a few rods of West's St. Peter's and Muscadine. Another instance is presented here of the efficacy of sulphur, applied in subjugating the attacks of mildew on Grapes; spots indicative of the pest were observed on several bunches, shortly before they began to colour. Flowers of sulphur were immediately dusted over every bunch in the house, and a further extension of the plague was effectually stopped. A large house apart from the range is devoted almost exclusively to the cultivation of Figs, the greater number of which are planted out in square bricked compartments. Three successive crops are annually ripened, the supply lasting from June until November. The houses are partially glazed with British sheet glass, 16 oz. to the foot, and no ill effects have ensued from burning; a large number of Strawberries are potted for forcing. Melons and Cucumbers are grown in pits. Pine-apples are not at present cultivated in this establishment.

An ancient and picturesque Oak stands near the garden entrance, measuring 30 feet in circumference; it has been preserved many years from the progress of decay, by the careful application, on every exposed wound and fracture, of a composition made of pitch and chalk, which effectually excludes the entrance of water into the decaying trunk of the tree.

Proceeding to visit the vineyard and kitchen gardens, distant nearly a mile from the house, we cross a broad open space of lawn (which the inhabitants of Hatfield are permitted, by the kindness of the Marquis, to use as a cricket-ground), and enter a noble avenue, "The true colonnade that should lead to a gentleman's mansion." "There is something august and solemn," the author from whom we have borrowed the quotation observes, "in the great avenues of stately Oaks that gather their branches together high in air, and seem to reduce the pedestrians beneath them to mere pigmies." The avenues of Hatfield-park might have suggested this beautiful description; few estates can boast of finer. The celebrated Oak called "Queen Elizabeth's" is included, like Herne's Oak in Windsor park, within the line of the avenue, and commemorates an interesting incident in the life of the Queen, whose name it bears. During the latter part of the reign of Queen Mary, the Princess Elizabeth was detained as a prisoner of state at the palace of Hatfield, but still permitted to wander within the precincts of the royal domain; she had availed herself of this privilege, and was resting at the foot of this ancient Oak, when a messenger who had sought her in vain at the palace, hastened to her here with the intelligence of the death of her sister Mary, and saluted her as Queen.

Pursuing our course from the Queen's Oak, and still enjoying the leafy shade of the stately avenue, we arrive at the vineyard. A castellated building, protected on each side by battlemented walls and flanking towers is the somewhat imposing entrance to this secluded spot. The supposition might be entertained that this formidable fortress guards precious Vines, and treasures their rich vintage; in that we are speedily undeceived. The vineyard exists no longer, but a sufficient compensation is presented in the existing garden, to quell any feelings of disappointment that may chance to arise. The picturesque site of the vineyard is on an abrupt declivity, sloping northwards to the valley of the river Lea, and terminating as it meets the waters of that river. The garden is in the style in fashion some hundreds of years ago, of which it is perhaps an unique example; we enter by a broad walk bounded by quaintly cut hedges of Juniper, and banks of Laurel, which extend along the summit, and running parallel with the wall and towers which protect the garden on the north side; from the centre of this walk, a flight of steps leads to a second walk, cut in the slope of the hill, similar in width to the upper walk, viz., 7 yards; successive flights of turf steps conduct to a third walk, and finally to a space of lawn which slopes gently to the river. The view from the upper walk, following the line of the descending steps, seen through an arch of Yew, springing from trees fashioned into architectural pillars is singularly effective; the river, which is here of considerable breadth, forming the most valuable feature. The second walk runs between a line of Arbor-vitæ and a looming wall of trained Yew trees.

The principal portion of the slope of the hill between the lower walks is occupied by ancient Yew trees, standing closely in formal rows. The long branches of the two external lines of trees have been, at a period comparatively recent, tastefully turned arching to the ground, forming delicious bowered walks. From beneath the central arch we see, right and left, radiating from a centre, avenues and arcades stretching away to the extent of the garden, meeting these bowered walks, which run parallel with the east and west boundary walls. Proceeding by one of the shady paths that lead slanting down the hill side, we gain the third terrace, which assumes here the semicircular form of the lower part of the garden. A row of Yew trees springs from the inferior slope, many amongst them being of great size and beauty. Their lower boughs are trained downwards, taking a broad circle round the stem, and forming vast buttresses; and other boughs interlacing, produce a lofty screen of foliage, pierced by windows, through which the lawn below, embellished with splendid specimens of Yew trees, dipping their branches into the river, is seen with peculiar effect. The banks and slopes, wherever exposed, are clothed with Laurels trained closely to the ground, and on other places with dwarf Yews treated in the same manner. The only deciduous tree in this garden of evergreens, is a noble Purple Beech, which occupies one of the slopes, and somewhat interferes with the general uniformity of the place.

Miscellaneous.

Underwood.—Scarcely any plant is equal to the Holly for undergrowth, since it will flourish under trees, and is not limited as to height, and is a thorough evergreen. Privet is superior as a rapid grower and of a denser habit, if not too much drawn up; but it is deficient in the size of the leaves, and in not being entirely evergreen. Rhododendrons thrive exceedingly well under shade; but require careful watering for a year or two. Portugal Laurels and common Laurels will endure some amount of it, but are injured by an excessive quantity. The Box tree and the Yew are more capable of withstanding its influence. And the evergreen Berberry, as a low-growing bush, is an admirable plant for placing beneath trees. All these are evergreen, and, of course, so much the more adapted for filling up permanently the space under trees. Elders, Dogwoods, the Norway Maple, Snowberries, and even Lilacs, as deciduous plants, will thrive beneath shade, though they cannot be expected to bloom much in that position. *Kemp on Small Gardens.*

Rise and Fall of Horticultural Enthusiasm.—Mrs. Dingley, on her part, consoled herself, and indulged her pride of housekeeping, by raising—thanks to Tisdal, and several large treatises on gardening—excellent tender vegetables, and Asparagus unequalled in size and flavour: that was her triumph. While Swift was at Moor Park, with Sir William Temple, he had learnt from William III. to cut them in the Dutch fashion, and had communicated the royal receipt to Mrs. Dingley. Tisdal had no prejudices in the matter of horticulture, and cut the Asparagus like a Dutchman. Moreover, Swift had told Mrs. Dingley that the King ate the white part of the Asparagus, as well as the head; and from that time forth, Mrs Dingley never saw Asparagus at table without repeating the anecdote, and urging her guests to follow the august example. Tisdal had an excellent set of teeth, and accordingly ate the whites of the Asparagus. But Swift, in his partiality for Stella, would not allow that the vegetable department was better conducted than the poultry-yard: he took delight in tormenting Dinglibus, and denying all her successes. The Asparagus, he said, was stringy; the green Peas too old; the French Beans tasted like Tares; the Artichokes were overgrown Thistles; in short, nothing escaped his censure. Mrs. Dingley was used to Swift's sarcasms, and a few jokes more or less would not have discouraged her, had she been really fond of gardening; but the fact was, that she was bored by all things, and in all places. She had been pleased by the notion of

living in the country only because she was tired of the town. She eagerly seized the first pretext for disgust; and as even the least ingenious persons are never at a loss how to gloss over their faults, she one fine morning found out the walls round her garden, and declared that such a place did not deserve to be called the country. From that moment the good Doctor's servitude was at an end. The garden was left to a hired labourer for two days in the month, and to Providence for the other 28; and the flowers got no more water, except what fell from heaven. Great indeed was the change in Dingley's kingdom. The Strawberries ran over the gravel-walks like mad; the humble Parsley shot up to the height of a couple of feet, and gave itself the airs of a shrub; the very Asparagus—the royal Asparagus—filled with guilty emulation, pointed towards the skies with their scarlet tops. Encouraged by the disorder, Thistles, Nettles, in short a whole host of parasites, took up their quarters in the beds. The rakes and spades were covered with rust—all was anarchy. The evil example of the poultry-yard had spread to the kitchen-garden; the vegetables also grew old and tough, and, like the fowls, were left to die a natural death. Luckily, Trim was a market town, and the cook well knew how to console herself. *Lady Duff Gordon's Stella and Vanessa.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Besides the usual ripening of Gloxinias, Achimenes, and other bulbous and tuberous rooted plants, there are many other stove plants which require placing in a cooler temperature during their season of rest. Under this head will be included Clerodendron squamatum and similar species, Allamanda, Aphelandras, Vincas, and various others which have done flowering; and which, as the late autumn and winter flowering plants go out of bloom, should be subjected to a cooler and drier treatment, until the proper season returns for their new growth; taking care that they are not allowed to become altogether dry—or loss of roots, and death, will be the consequence. If a stock of young plants has been reared, many of the older ones may be discarded, thus making room for others which it is more desirable to preserve. Let every exertion be made not only to keep in check, but also to eradicate insects, especially the "mealy bug," and those of the scale family. They breed more or less, all the year round, but more slowly at this season than during spring and summer. If, therefore, vigorous and persevering endeavours are made to destroy them, by examining the plants, if possible once a week, their numbers will be so much reduced in the spring, that sufficient time may be spared, even in that busy season, to cure effectually this worst of all garden nuisances. The best of all tools and materials for this purpose, are the sponge and syringe, with hot water (110° to 130°) and soft soap. Let every tie be unfastened, as these are their favourite hiding places during winter; and where wire trellises are used, they should also be thoroughly washed with hot water.

FORCING DEPARTMENT.

Peach-house.—Those who intend to have Peaches in their first house ripe by the middle of May, should commence forcing immediately. If the greater part of the roots are in the outside border, it should be covered with dry litter, Fern, or tree leaves, which in their turn should be kept in their places and nearly concealed by a slight sprinkling of earth. The interior temperature should be very moderate at first, commencing at 40° as night temperature, and increasing very gradually till the season is fairly turned; the day temperature may rise 10° by fire-heat, and 15° to 20° by sun-heat. Unless the weather is very damp a slight syringing may be given every day with tepid water; and when the weather turns out very fine, the operation may be repeated. It must, however, be distinctly understood that these syringings are not to be construed into delugings, but that the water is to fall on the plants like fine dew. The early Peach house or a pit under similar treatment will be excellently adapted for starting Strawberries to produce a very early crop; but the latter should if possible be plunged into a bed of leaves or some other material, to give a gentle bottom-heat; and if such can be introduced into the Peach house, the warmth and moisture therefrom will be beneficial to the Peaches also. The pit, however, is preferable for the Strawberries, as they can have the mild bottom-heat and still be near the glass. Fig-house.—Let the shoots be untied, and if any pruning is necessary it should be performed at the same time, but if proper attention has been paid to stopping the shoots during summer very little pruning with the knife will be required; in fact it will be confined to removing a few shoots where they are too crowded to admit of their being properly trained. The shoots should be cleaned and washed over with sulphur and soft-soap, taking care not to injure the buds when performing these operations. The walls, woodwork, and glass should be thoroughly cleaned; and any necessary paintings, colouring, or other repairs done forthwith. After these matters are duly attended to, and the trees neatly re-trained, the house will be in good winter order. There is a great advantage in getting this sort of work done as early as possible, as it allows of the houses being used for stowing away plants which merely require protection; and it leaves the hands clear in spring for the many and pressing operations which will then require attention.

FLOWER GARDEN AND SHRUBBERIES.

The flower garden being now cleared of all its summer occupants, the beds neatly forked up, and the turf, &c., put in order, let the walks have their share of attention, raising any low places, to give them an uniform shape, and to throw off the wet into the side drains. When they are dry, let the roller be frequently passed over them, as by making the surface of a well formed walk firm, the wet will pass off more freely, and it will consequently be in less danger of injury by the frost. The enjoyment of a garden during winter depends so much upon the state of the walks, as regards smoothness and dryness, that too much attention can scarcely be paid to them.

FLORISTS' FLOWERS.

Amongst the care and attentions bestowed on other favourites of the amateurs, such as storing Dahlias, planting Tulips, wintering (placing in frames) Carnations and Picotees, the Ranunculus must not be forgotten; the roots should be examined, and if sound and healthy, the bed may be prepared. We have seen first-rate blooms, the result of widely different systems, from beds prepared in the following manner. The first was simply as follows: the soil was excavated to the depth of 12 inches, and some turf sods or flag being pared from a neighbouring meadow, about two inches in thickness, this was laid in regular layers Grass side downward, trampling it firmly down, till the bed was filled, the upper sods remaining exposed to the action of frost, &c.; at the proper time of planting, a rake was drawn over it, just loosing the soil; the claws of the roots were pressed down, and then covered with two inches prepared vegetable compost. Ranunculuses like a firm subsoil, and the flowers produced by this system were superb. The other was by covering a bed, previously well dug, with a dressing of night-soil, an inch in thickness; this being exposed to frost and rain of winter, was washed into the soil. At planting time, the surface was slightly moved with a small fork, and the roots planted and covered as above: the bloom was abundant and fine; but we are bound to add, the roots suffered from the excessive stimulant.

HARDY FRUIT GARDEN.

Whenever the state of the weather will permit of the soil being worked, it is a great advantage to fork the ground about the fruit bushes lightly over, and at the same time to work in some well-rotted manure amongst the roots; the same operation buries the leaves, and gives to the whole a neat and orderly appearance. The requisite pruning, staking, and tying should be first performed, to prevent the necessity of treading upon the ground, after it has been forked. If the Raspberry canes were not thinned in the autumn, they should now be reduced to four of the strongest on each stool, rejecting any which may have been deteriorated, by producing fruit in autumn; and, as a matter of course, entirely removing all the old canes. The stakes should then be examined, and renewed, if necessary, fixing them perfectly upright in straight lines, and cutting them to one uniform height, that the whole may bear evidence of good workmanship. When forking in the top dressings, a little pains should be taken to destroy the embryo suckers which are visible on any of the roots.

State of the Weather near London, for the week ending Nov. 28, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

American Blight: *Sub.* Your trees are approaching the condition represented (by woodcut) and described at page 755, 1849. Wash the branches with spirits of tar, very strong vinegar, or oil. Apply them with a painter's brush.‡

Apple Pips: *Amateur.* Keep them in dry sand till March. Then choose a light dry place in your garden, and sow them half an inch deep. They will soon come up, and require no other care than to be kept clear of weeds. There is no more art in raising fruit trees from seed than in raising Radishes. They may all be treated in the manner above described; only stones should be planted deeper—say an inch.

Books: *H L.* Probably Meyen "On the Geographical Distribution of Plants" will suit you. The original is in German, but there is a translation published by the Ray Society.—*J J.* Designs in the Italian style may be found in Loudon's "Encyclopædia of Gardening."‡

Fruit Trees: *C S.* Besides a sufficient quantity of Morello Cherries, you may plant against a north aspect the Jargonelle Pear, Orleans Plum, and Dumelow's Seedling Apple.‖—*J S H.* For an east aspect wall, in an exposed situation, you may try the Ribston Pippin, Blenheim Pippin, and Scarlet Nonpareil; Knight's Monarch Pear; and the Royale Hâtive and Jefferson Plums.‖—*G S.* The following arrangement is adapted for the objects you have in view: for the south aspect of wall, along the north side of garden, Royale Hâtive, Green-gage, Purple-gage, and Washington Plums; May Duke Cherry; and Glout Morceau Pear. For the north aspect of same wall: three Morello and three Kentish Cherries, or you may substitute in part the Orleans Plum and Shropshire Damson. For the east wall: five Alderton Plums; two white Magnum Bonum do.; two Bigarreau Cherries; one Jargonelle Pear. For the west wall: two Marie Louise, one Passe Colmar; two Knight's Monarch Pears; two Jefferson, one Coe's Golden Drop, two Orleans Plums. You may plant the north aspect of the wall on south side with Dumelow's Seedling Apple. You state that you have a very free bearing and excellent Plum, under the name of Alderton, or Battle Plum. There are old trees of the sort in Sussex, and it is the same as Denyer's Victoria.‖

Glazing: *D C.* There is nothing like putty, if well made. Very likely your's contains chalk, as well as white-lead. It is the easiest to apply, the easiest to remove, dries fastest; only take care that the sashes are dry when they are puttied.

Grapes: *G R.* The Esperione is of a bluish black, and more acid than the black Hamburgh. There is an excellent drawing of it in the "Transactions of the Horticultural Society," 1st series, vol. iii., *p.* 93.‖

Heating: *Ballandyne.* No doubt brick flues will be the cheapest for your purpose.

Insects: *Reader.* The most effectual way of clearing Vines, Peaches, and Plums of scale, is to wash them with water at the temperature of from 150° to 160°.‡

Manure: *G T.* Undoubtedly hen manure will suit Vines perfectly; but it must be abundantly mixed with decayed vegetable matter, or some other neutral substance, or it will burn the roots. It is of the nature of guano, and quite as powerful.‡

Names of Fruits: *I E G.* The Blenheim Pippin.‖—*G F M., Limerick.* The Scarlet Crofton; much esteemed by many, others prefer a brisker flavoured Apple.‖—*Daniel Judd.* Not known.—*W W.* The Black Hamburgh.‖

Names of Plants: *J W G.* Eupatorium glandulosum.—*J P.* 1, Hypericum pulchrum; 2, Veronica officinalis; 3, Narthecium ossifragum; 4, Helianthemum vulgare; 5, Malva moschata; 6, Erythræa Centaurium; 7, Œnanthe fistulosa; 8, Epilobium angustifolium; 9, Cratægus sanguinea; 10, If this is a native of "shady banks" in Britain it is Blechnum boreale, and which has a representative in the southern hemisphere scarcely distinct. *S.*

Potatoes: *C J C.* The Ash-leaved Kidney is one of the best early Potatoes for a south border; but the Early Manley is nearly as early and more prolific; therefore you should plant some of both sorts.‖

Roses: *Tyro.* It might not do much harm to the inserted buds in Dog-roses that were budded in July and August last to remove the stocks just now; but we should certainly prefer permitting them to stand where they are till next autumn, in order to allow the buds to branch out before removal.‡

Schemes: *M B.* You will be very foolish if you invest your money in any such scheme. If you have a fancy for Californian risks, you had better go to the country yourself—if you are young, strong, bold, and hard-working.

Shallots: *Sigma.* Deficiency of warmth no doubt caused the rotting you mention. The soil *must* be as warm and dry as it can be in England.‡

Strawberries: *C J C.* The best and earliest for a south border, is the Keens' Seedling. The British Queen will succeed it; and still later, the Elton.‖

Turnips: *G S.* The "Teltower Rübe" is the small Berlin, or Teltow Turnip, used for *ragouts;* it requires a soft sandy soil.‖

Vines: *H P.* The new Black Hamburgh Grape, crossed with the Muscat of Alexandria, will probably succeed in any situation that would suit the Black Hamburgh. This much may at least be inferred from the statements received along with the specimens sent us. More than this, we cannot state of it at present. The Black Hamburgh, Royal Muscadine and Black Prince will succeed in a Vinery without early forcing.‖—*A Country Parson.* Better have two Black Hamburghs and a Black Prince. Your selection of white Grapes will do very well.‖—*W D F.* In a Vinery that has had the mildew so prevalent this year upon the Grapes it will do no harm to whitewash or otherwise dress the wood of the Vines and house generally now. The Pear will usually succeed by grafting on a Hawthorn.‡

Vine Borders: *J S H.* For these a clayey loam is not good, and what is generally called sandy loam is too poor. A loam that is rich and friable is to be preferred. When put into a garden pot, and frequently watered, it should still remain pervious to water: 2½ feet is a good depth, 6 inches of which may be cow-dung. By building up the turf so as to dry it, and then pen sheep upon it for some time, you can make sure of an excellent composition for a Vine border, with a less proportion of cow-dung than that above-mentioned; but, otherwise, let the turfy loam and fresh cow-dung be disposed in alternate layers, and after a few months turn and well mix the whole. Bone-dust and lime-rubbish may also be introduced.‖—*F H S.* As you are F. H. S., you must have the Society's Journal, in which, at p. 305, vol. ii., you will find a plan of warming Vine borders as much as they can be by merely natural means. You may, however, wish to apply artificial heat, in which case you cannot perhaps do better than adopt Fleming's plan, at p. 288 of our vol. for 1845. For depth of border, &c., see our Home Correspondence of to-day.‡

Vines in Pots: *An Amateur.* The Black Hamburgh and Royal Muscadine are the best sorts to grow in pots. Soil, rich turfy loam and bone-dust; guano in plenty of water may be supplied occasionally. The same plants will bear successively if always well managed. By these means you may easily grow the plants strong enough to bear fruit, and yet they may not be disposed to do so, unless you could contrive to train them on a similar principle to that adopted against walls by the Vine growers at Fontainebleau and Thomery. Such proposal is new; to many it will doubtless appear strange, but we are convinced the result would prove satisfactory. Instead of one upright shoot, train two horizontally; from each of these train two uprights for bearers; stop the latter when they have attained the height of 2 or 2½ feet, and cut them back at every winter pruning to the lowest eyes. You can safely remove Vines as you propose.‖

Walls. Nails should never be driven into the face of the bricks, and but very little way into the joints. Attention being paid to this, after many years, perhaps half a century, the joints may require fresh pointing; but then the wall will be nearly as good as new. Thin cement will effectually close up the nail-holes with which your bricks are already so much defaced; and you can in future either profit by the above remarks, or use studs, which any respectable ironmonger will be able to procure for you.‖

Misc: *L B S.* Plumbago Larpentæ will stand the winter in the neighbourhood of Dublin without protection. Christmas Roses like wet heavy land.‡—*W D C.* You can have the Number. Enclose six postage stamps.

SEEDLING FLOWERS.

Azalea: *G D.* Large and showy, but coarse.*

Chrysanthemums: *E M.* All good; but not better than kinds, possessing similar colours, already in cultivation. Of the Pompons, Criterion, L. Miellez, and La Gitana are the best. The yellows are too much alike.*

Hollyhock: *Reader.* Two finely-shaped blooms, full, and very free from "pockets."*

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	...£11 0 0
Turnip Manure, do.	... 7 0 0
Superphosphate of Lime	... 7 0 0
Sulphuric Acid and Coprolites ...	... 5 0 0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.
Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

IMPORTANT NOTICE—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.
This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament.
Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

FURZE MACHINE.
COTTAM AND HALLEN have now brought to perfection FIRCHILD'S PATENT FURZE CUTTER AND BRUISER, for the preparing of Furze for Feeding Horses and Cattle. The Machine may be worked by horse-power, and will cut and bruise at the rate of 20 bushels per hour with one horse, a man, and boy; with two horses, 40 bushels per hour; if a steam-engine, in proportion to the power applied. The Machine is now on view at COTTAM and HALLEN's, No. 2, Winsley-street, Oxford-street, where every other description of Agricultural Machinery may be seen.

The Agricultural Gazette.
SATURDAY, NOVEMBER 30, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	Dec.	4—Agricultural Society of England.
THURSDAY,	—	5—Agricultural Imp. Society of Ireland.
WEDNESDAY,	—	10—Agricultural Society of England.
THURSDAY,	—	11—Agricultural Imp. Society of Ireland.

CONSIDERABLE discussion has been going on for some time amongst our correspondents respecting the proper state in which farm-yard manure should be applied to the soil. Some, on the one hand, recommending that it should be used tolerably fresh—others keeping it over two seasons. There is one portion of Mr. RIGDEN's practice, as described by Mr. MILNE* in his report of a visit to that gentleman's farm, which seems to offer a fair compromise between this diversity of opinion and practice, to which we think the attention of farmers may be usefully directed.

"The greater part of the manure," says Mr. MILNE, "is laid on in the autumn for crops which are to be sown in the spring, so that the soil has time to be thoroughly impregnated with the elements of fertility required for the particular crop."

We first observed this practice on some strong soils in Roxburghshire; it was there the usual plan to apply the farm-yard manure in the autumn fresh from the folds upon the stubble land intended for Turnips—nothing but bones or guano being used in the spring. This practice was followed by the best results. We also observe at the discussion on Mr. MILNE's report, which took place at a recent meeting of the East of Berwickshire Farmers' Club, that "a favourable opinion is entertained of Mr. RIGDEN's practice of autumn manuring to a certain extent." Some of the speakers also mentioned that they had tried it with advantage.

As we are anxious to recommend this practice, we gladly fortify our recommendation by thus quoting the opinion and practice of other farmers, as we feel assured that wherever this can be done there will be much less hesitation amongst our readers to adopt it, than if the advice had been founded merely on our own authority.

Some will object that by this plan a much greater amount of the valuable matter of the manure will be lost than by fermenting it in heaps. Independently of the unanswerable contradiction given to this objection by the excellent crops produced, we believe that other reasons can be brought forward to render it probable that actually less will go to waste. When manure is thrown up into heaps in the usual fashion, a violent fermentation immediately takes place, evolving so much heat as to drive off almost the whole of the ammonia produced. Such was actually the case with some manure we sent for analysis after being treated in this way; not a trace of ammonia could be found in it. The importance of this ingredient of our crops has been clearly proved, and though we would not agree with the French chemists when they propose to calculate the proportionate value of all manures by the relative quantity of ammonia they contain, we would yet admit that such a total loss as that analysis showed must be a serious deterioration of value. On the other hand, when the manure is spread on the land in a comparatively fresh state, and immediately ploughed in, a very slow fermentation takes place, and the ammonia, as fast as formed, is absorbed by the alumina, which occurs in large proportion in strong soils, and by the humus also existing there: and as the green crop is sown before the hot weather of summer comes on, when a more rapid fermentation would take place, there seems little doubt but that the greater part if not the whole of the ammonia will be saved by this plan.

The other ingredients required by plants, which are found in an insoluble state in the fresh manure, are also protected from the waste of the winter rains, by the extreme slowness with which the fermentation takes place when the manure is applied in the autumn, both because the weather is then cold, and because the material is spread over the land in such small quantities.

It is, however, necessary to guard our readers against indiscriminate adoption of this plan of autumn manuring for green crops. We think it best adapted to the strongest class of Turnip soils, because upon light porous soils we fear that the fermentation would take place too rapidly, in consequence of the free circulation of the air these soils admit. This is however not so much to be regretted, as one great advantage the autumn manuring is capable of affording to strong clay soils (should it be found to answer our expectations on further trial), will be the saving of time in early spring, which will be thus secured; the great difficulty which attends the cultivation of Turnips on these soils being the impossibility of commencing early in the spring. Upon light dry soils no difficulty in this respect is encountered. We would also advise that autumn manuring be confined to clean land, as any root weeds that exist in the soil will be sure to be greatly increased by the practice, and of course the land must be drained.

With these cautions we would recommend the trial of Mr. RIGDEN's plan of autumn manuring. Upon all situations where it is found to answer, it will be of great consequence, because the work will by this means be much forwarded, and a greater breadth of green crop consequently accomplished.

* Report of a Visit to the Farms of Mr. RIGDEN, &c.

ON THE CULTIVATION OF WHEAT.—No. III.

I NOW proceed to lay before your readers the result of a few more experiments. For some time past a difference of opinion has been expressed by our best farmers respecting hoeing Wheat in the spring of the year, when the crop is free from weeds; some maintain that the hoe injures the roots, and thereby causes or gives the plant a greater tendency to fall; also, that, as Wheat requires a firm, solid soil, the land should not be moved, except where it is necessary to clean it. Being myself of this opinion, which had not, however, been confirmed by facts, and as hoeing was very advantageous to many crops, I thought it might not be so prejudicial to Wheat as some imagined; accordingly, the following experiment was made by drilling in October, 1849, two plots of land of about a rood each, contiguous to each other, at intervals of 8 inches, with Girling's Hessingland Wheat, after a crop of good white Clover. Early in the spring of the present year one of the plots was well hand-hoed, although quite free from weeds, and the other plot left without having the soil in any way disturbed.

	Bush.	pks.
Wheat not hoed produced per acre	30	2
Wheat well hoed ditto	28	1

It appears from this trial that it is injurious to hoe Wheat where the land is free from weeds, and consequently it should not be harrowed, or the soil in any way made loose; but where weeds prevail, no doubt can be entertained, but that they ought to be eradicated. And the important point (in the minds of some persons) in growing of Wheat has engaged my attention—viz., the changing of seed, although I ever have been doubtful whether any advantage can be derived from the practice. In the month of October, 1844, one part of a field was drilled with Wheat, at intervals of 7 inches, of the Rattling Jack kind; about a rood from this was measured off, as the Wheat had been grown on my farm here three seasons without change; this I call No. 1. The other part of the field was also drilled in the same manner, on the same day, with the same kind of Wheat, and from the same stack as No. 1, but the year preceding it was sent to be grown on a farm I occupied in Rutland; about a rood, also, from this piece, No. 2, and adjoining No. 1, was measured off; both pieces were after red Clover, eaten on the land by sheep. The next harvest both pieces were reaped on the same day, and when threshed—

	Bush.	pks.
No. 1 produced per acre	39	0
No. 2 ditto ditto	38	1

It appears from this trial that no advantage arises from a change of seed, although the soils were very different, and the distance 40 miles apart (amounting almost to a change of climate) between the lands which produced the seed for this experiment.

The following trial was made many years ago to prove the relative value per acre of drilled and broadcast Wheat. In the month of October, 1823, part of a field was sown broadcast after Clover lea with Wheat, and the remaining part of the field drilled at 7 inches apart between the rows on the same day, with the same quantity of seed per acre, and the same sort of Wheat as the broadcast; 1 rood from each part adjoining was measured off, and produced as follows:

	Bush.	pks.
Drilled Wheat, per acre	34	
Broadcast ditto	33	3

The difference in yield being but little in favour of drilled Wheat, yet it confirms the general opinion that drilling is the best way to insure a plant, and consequently to get a good crop of Wheat; indeed, it appears to have many advantages over any other system of planting. Many excellent crops have been grown from dibbling Wheat, but the trouble, expense, and difficulty in getting it well done by hand has prevented it becoming more general in practice. My Wheat is invariably drilled now (at 8 inches), and deposited as deep in the land as circumstances will admit of, and has not failed in planting well; also, to retain the plant for more than 20 years, except once, when the Wheat was drilled on very light land, after a crop of Rye-grass or Bents, the plant from which was killed by a long and severe frost.

The smut in Wheat has been troublesome to some farmers, and more so on some soils than others. I have known Wheat sown on a farm dry, the seed not having received any preparation for years, and have sown many acres the same myself, without producing smut, until 1849, when a small piece of land was drilled with Wheat in the spring in a dry state, which proved very smutty. Various are the opinions respecting the causes, and many are the remedies applied. Farmers, however, have now a preventive offered to their notice—viz., "Down's Farmers' Friend," which is making its way into general use, the efficacy of which will be seen by the following trial. My practice is frequently to pick some of my best white Wheat for seed, to keep the sort pure and clean; this is done by selecting the whitest, longest, and best grains, and is a very tedious and expensive process. Some Wheat was picked in this way in 1848, and sown on a small plot of land; the produce, however, proved very smutty. This surprised me, as it was not very probable that the persons who picked the Wheat (and it all passed under the observation of two parties) could have selected any smut balls, and the more so as the bulk of the Wheat from which it was taken was apparently quite free from smut. I should at once have put this Wheat away had it not cost me much trouble to procure it; however, I determined on sowing it again, to try the efficacy of "Down's Farmers' Friend;" accordingly, this smutty seed was prepared by the directions given, and as I wished, if possible, that the produce should be clean, the seed received a double dressing, and was sown early in October, 1849. The desired effect was obtained, for I have not seen amongst the bulk grown from it a single smut-ball. Thus it appears that "Down's Farmers' Friend" certainly acts as a preventive against the smut. The way is cheap and easy in preparing the seed, and the Wheat drills much better than from any other method that I have tried. The Wheat can be sown or drilled an hour after preparation, and will keep, if required, any reasonable time without damage.

I must now for the present close this subject, trusting that these statements may be received in the same spirit as that in which they were written—having a tendency to do good. The experiments were made for my own information and advantage, on which I rely and intend to act; they are now before your readers, to use them as they think proper. *T. E. Pawlett, Beeston, Biggleswade, in Bell's Weekly Messenger.*

POULTRY MISCELLANIES.

6. *Remarkable Facts: a. Nests of Eggs, like nests of boxes.*—"I have been wishing I could send to you for some time, having a curiosity in the egg way. It is a perfect egg inclosed within another; the upper shell would not, it appears, bear the moving about in the nest after being laid, and so got crushed under the hen. Evidently it has had a yolk, as the inside is smeared with it; but the inner one is perfect apparently. What makes the montrosity the more remarkable, is that the hen continues to produce these abortions, but differing in form: sometimes they are like this (of which I had two, but broke one in bringing it home); sometimes they are quite small, having only white in them, I imagine, and then again flat-sided; in short, seldom alike. The hen belongs to the person who has reared some of my best chickens this season; she is part Cochin China and part Dorking—very little of either!—the other part unrecognisable. I hear to-day she is to die, but I have a great mind to send over, if I can, and save the dislocation of her neck. Would you like to have the creature, and see with your own eyes such things as you scarcely ever saw before? . . . . I have blown the double-shelled egg without shattering it, and it only waits an opportunity to become yours. *W. H. H.*" Having seen an abortive egg shaped like an hour-glass, with a contraction in the middle, and a bulging part at each end, which is perhaps as great a mis-shape in an egg as it is possible to conceive, the kind offer of being put into possession of this mother of monsters was declined, and the specimen alone accepted as sufficient to content our curiosity. But the other day we met with more "nests of eggs," in a letter from Sir Thomas Browne to his son Edward, July 4, 1679.—"The large egge with another lesser within it was a swann's egge which I sent divers yeares past unto the Royal Societie. I had before met with an egge within an egge, as in hennes' egges and turkeys' egges. I kept any I found in that kind, in a box inscribed *ovula in ovis*. At last I met with a swann's egge of that kind, which I presented to the Royal Societie, having never before nor since mett with another from a swanne."—These strange productions are almost as instructive in the morphology of *ova* in birds, as the unusual growth of leaves on various parts of a plant, are indicative of the plan upon which vegetables progress during their state of increase. The principle of the formation of *ova* in birds is *concentric*. There is the yolk within a mass of denser white, within another mass of thinner white, within a filmy skin, within an earthy shell. And if any agent of over-productiveness is at work in the bird's frame, *the same principle still goes on*; there are either two yolks, both inclosed within one film and one shell, which is the commoner case, or more rarely, as we have seen in the above instances, a complete egg is contained within another complete egg. The additional produce thrown off at one effort is still *concentric*.

b. Twin chicks from one egg.—"I have frequently had cases of double-yolked eggs producing chickens. Last year at S. F. W——I had four chickens in two eggs, and up to the day of their hatching they were alive. I had much faith in the chance of their coming out right, but Nature was exhausted. On a *post mortem* it appeared that they had not room to kick themselves out; the egg was excessively crowded. I regretted much that, on the first chipping of the egg, I had not gradually released them myself. They were all four nice healthy, full-grown, *separate* chickens; and, moreover white Dorkings. At Ebrington, in Gloucestershire, Mr. William Keyte had a black Bantam cock and hen hatched from one egg. They lived, did well, and bred, and I was going to buy them; but when Mr. K.'s poultry was done away with, the little pair of curiosities were killed. Beautiful indeed were they; and my only reason for not having them at first was, that not expecting such a sweeping measure to be adopted against them, I delayed, not knowing exactly where to place them, and being fearful of contaminating my silver birds. I often put double-yolked eggs under hens, but have not yet had one hatched to live. There are many specimens of monsters in that way in the Manchester School of Medicine. They have the egg there in every stage of incubation: that is, specimens most cleverly taken, and moulded in some sort of composition. I should say you will be quite at liberty to notice the two chickens from one egg. Mr. K. told me last week that his mother has one little hen now living from the twin parents. *W. H. H.*" *D.*

Home Correspondence.

A New Fence.—There are many situations in which the want of a good durable material for a protective fence is much felt; that I have to suggest is corrugated galvanised iron. I am not aware if it can be furnished at a price which would be suitable, but the material appears particularly well fitted for the purpose of fencing in many situations, as well as for divisions about farm buildings. It would be very durable, and, when painted, would have even a handsome appearance, from its irregular surface; it would take all curves and angles, and could be very quickly put up. I would propose that uprights of galvanised iron should be firmly fixed in the ground at proper distances; between them a course of bricks should be laid, on which the sheets should rest. The lengths should interlace each other, so that no joinings would be visible, and have some sort of loops through which the uprights would pass and secure the whole. Where the height is above 4 or 5 feet, it would add much to the strength and appearance to have an iron or wooden mould passing along the top, being fixed securely on the tops of the uprights, and thus forming a secure frame. The power of resisting the effects of temperature is now well ascertained of this material. It probably could be manufactured of a lighter quality than hitherto, and the cost would be reduced. I should have stated that the ridges should be upright, not horizontal. This suggestion is well worthy the attention of manufacturers, and you will be apt to suspect that I am in some way interested, which is in no way the case, except as in all rural improvements. *Forester.*

Modern Bread is worthless.—Firstly, it will be remembered, I stated that thousands of infants die in union workhouses, not so much from defective nursing as from the improper food with which they are fed. This statement, however, as I anticipated it would, has been received with some degree of surprise and scepticism by many humane and well meaning persons. I stated also, in reference to the food of infants, and, I may add, of persons whose sustenance is chiefly bread, that "modern bread was worthless." I proceed, therefore, to explain my meaning in reference to these points. But before I proceed, I must clear the way a little, and refer to what I advanced concerning the different properties and qualities of different kinds of Wheat. With reference to the quantity of gluten or azotised matter in different kinds of Wheat, and which is the subject of this inquiry, I have always admitted that the same kinds, in different years and grown on different soils, and under different kinds of cultivation, will yield different portions of azotised matter. This I have admitted, and I have no doubt of its correctness; but I maintain that there is a greater difference in the quantity of this substance in the different kinds of Wheat than exists in it from the different modes of their cultivation. Thus, I maintain, that bearded Wheats, and at the head of these is the Egyptian, under whatever mode of cultivation, or under whatever other circumstances, contain more azotised matter than polled or non-bearded kinds; and consequently that bread made from the Egyptian and other bearded kinds, is more nutritious than the bread made from any other kinds; but that from the Egyptian is the best. I also maintain that all kinds of red Wheats contain more azotised matter than white Wheats, even if grown side by side in the same field, and let the cultivation be whatever it may. [Will you favour us with references to the analyses on the authority of which you "maintain" these propositions?] From this statement it will appear that I consider the intrinsic value of the Egyptian to be above all other kinds, because it contains the most nutritive properties; and I consider, for the same reason, that the intrinsic value of all red Wheats is greater than that of all white kinds of Wheat. It is true that the marketable value of white Wheat is higher than that of red; but the inquiry is not into the marketable values of different kinds of Wheat, but into their real and intrinsic values, or, in other words, as to which, out of the numerous known kinds, contains the most azotised matter, called gluten, and consequently will make the most nutritious bread. But I add, also, that as well as its nutritive properties being the greatest, the Egyptian must likewise be classed among the white kinds of Wheat, and which is another singular property of it. Before quitting this part of my subject, let me also repeat that I have no personal interest whatever in recommending to the readers of your journal and the world this very interesting and beautiful kind of Wheat, except that I believe it is the most profitable to be grown, as well as the most nutritive of all the known kinds. But whoever cultivates it must do so on the principle which I have advocated for all kinds of Wheat, that is, he must seed it thinly, and by no means to exceed 2 pecks an acre, and every grain should be planted separately. I myself intend not to exceed 1 peck, and this year I shall plant it in land as poor as any in this neighbourhood; indeed, land can hardly be poorer, as I believe it has been cropped without manure for 20 or 30 years. Having so far cleared the way, I now explain why I consider modern bread to be worthless. It will be admitted, I believe, that the stamina of agricultural labourers in the parts of England where they feed chiefly on bleached bread, for many years has been, and still is, decreasing. The men have diminished in size, their bones are smaller; they are not strong and athletic, as formerly, and are subject to many more maladies, such as hernia, &c., which indicate a diminution of natural strength and vigour. All observant persons, who live among them, remark these facts; and, I believe, they cannot be refuted. It is a fact also, and admitting of easy proof, that notwithstanding the improved cleanliness of the population in general consequent on the cheapness of cotton and woollen manufactures, vast numbers of the human race still perish in infancy or whilst under two or three years old. Some years since, whilst discharging my official duties, this latter fact very frequently pressed itself upon my mind, and painfully affected it. I saw many fine and beautiful infants, and in all appearance as healthy as infants could be; they were also tenderly nursed, kept clean, and all reasonable care was taken of them; yet they did not grow; their size remained stationary for some time, till at length they put on a cadaverous and sickly hue, and gradually diminished in bulk, till they closed their eyes in the arms of death, their last nurse. Surely, said I to myself, those infants ought to have grown into men and women. Healthy and strong at their birth, they ought not to have perished so prematurely, like flowers nipped in the bud by frosts. With such thoughts as these pressing themselves on my mind, I determined to do all I could to discover the cause of so distressing an evil, and at length I fixed it upon the food with which the infants were fed, and all subsequent observation has confirmed that opinion. "What! find fault!" were the exclamations pressed upon me by all kinds of persons, "with nice pap, made of tea, and sugar, and beautifully fine white bread; look, examine, and taste how very nice it is. It was the will of God that the infants should die, and so nothing could save them; and, poor things, they could not go at a better time, and they are gone to rest." In this manner have I been often answered by men and women whom the world esteemed very good and nice people, and clever too; but they certainly ought to have known better. But what was the nice pap made of? An infusion of leaves, not equal to pure water; sugar and carbon, extracted from Wheat meal, the elements of which being the same as those of sugar. This was the food of those infants; for, be it remembered, that I am referring chiefly to such as, in union workhouses and other places, from some cause or other, had been deprived of their mothers' milk, their natural and best sustenance; I referred, be it always borne in mind, to those, and such children as those. But cannot a child live upon such food as that? Cannot a child live upon the finest wheaten bread, sugar, and tea? Certainly it cannot, nor could a dog; feed a dog upon such pap, and in a few weeks the poor animal, however strong and healthy before, would pine away and die exactly as infants will. But permit me to illustrate my meaning by an analogy, which, although not quite exact, will nevertheless suit my purpose well enough. To build a modern house we should require bricks, or stone, and timber, and lime as the chief materials; but suppose we attempted to raise the building, and expected it to be durable with any one of these materials only, leaving out the other two, all eyes would be upon us and our strange building; and perhaps we should be stopped proceeding with it by some humane friend taking out a statute of lunacy against us. Now, pursuing the same analogy, to build up a child to manhood, three principal materials are also as necessary, namely, carbon, azote, and lime, and without the whole of the three man can neither be built up nor exist, but for a very short time; but the children I am referring to were deprived of two of these requisites; how then could they live? It was impossible they could, and so their deaths were inevitable. But how deprived? let us examine. Wheat contains these three materials, viz., carbon, gluten, and lime. The Creator, in His mercy and wisdom, formed it of these three, intending it, no doubt, to be the food of man. But did the infant's pap contain them? Certainly not, or two of them so minutely as to render the pap worthless, *i. e.* a mere mockery of food; the lime and gluten having been extracted from the flour with which the bread was made in the dressing of it. The gluten, or azotised matter, was designed to build up the animal tissues with, but man extracts all this from his own food and feeds his pigs with them; animals which could the best of all others do without them. Some divines persuade themselves, and endeavour to persuade others, that man has no freedom of will; but if he have no freedom to act wisely, he shows too often that he certainly can act very ignorantly and foolishly. But, again, lime is made an ingredient in the grain of corn clearly for the purpose of forming the bones of animals which feed upon the corn; but man, again, extracts the lime from the ground meal of Wheat, since it exists in the bran and pollard almost alone, and no portion of which is suffered to remain in the dressed flour. With what food, therefore, should those infants deprived of their mothers' milk have been fed? for this is the important inquiry. Certainly in a great part with cow's-milk, for this contains in it, though in an inferior degree, all the substances of the other; but human milk is, of course, the best possible food for infants, the milk of the ass next, and then that of the mare; but each of these contain the three requisite substances I am contending for, namely, carbon, or, as it is also called, the life-supporting principle; casein, also—a substance analogous to the gluten in Wheat, and the fibrin in the flesh of animals, and with which all the tissues of the bodily frame are constructed and repaired; and lime, with which to form the solid parts of the body, namely, the bones. But the infants I am referring to, were fed upon carbon only; and as well, therefore, we might expect a house to stand against the pelting of the winds and storms, when built of bricks only, and with nothing to hold them together, as to expect children to grow up to manhood when fed with but one of the three absolutely requisite substances for their support. It is remarkable, as among the millions of other proofs of the wisdom and provident care of the Supreme Being, that the milk of a female, who has a a fractured limb, the lime in it is reduced in quantity until the fractured bone be again united. The eggs also of a fowl, which has a broken limb, are without shells until the broken parts are again united likewise. In referring again, as I wish briefly to do, to what has been advanced in reference to the diminished strength and size of agricultural labourers, whose food is chiefly bleached bread, as is now the case in many or most parts of England; I wish to add, that, were their bread made with undressed or slightly dressed wheaten meal, with a small portion of the meal of Lentils or Peas, or even Beans mixed with it, they would be much healthier, and, of course, stronger and more robust than they now are, and that their stamina would, consequently, gradually and perceptibly increase. Pulse, I add, contains more gluten than cereal grain. In conclusion, I add,

also, that the casein of milk, the gluten of cereal grain, the legumin of pulse, the fibrin of the flesh of animals, are all and each of them converted into one and the same substance, called albumen, analogous to the white of an egg, in the stomach; and that that substance, and phosphate of lime, are the raw materials, out of which all the various fabrics of the body are built up, and repaired. As these, therefore, are facts, capable of actual proof, I ask whether "modern bread, which is nearly carbon only, be not worthless" for the persons to whom I was referring, namely, infants deprived of mothers, and rustic labourers, who feed upon scarcely anything else than such bread, and whose beverage, in these refined times, is little else than an infusion of a few worthless leaves, which, were they grown at home in England and in their own gardens, would be suffered to be blown away by the winds, or ignominiously permitted to rot on the ground, or be thrown on the fire and burnt. *Geo. Wilkins.*

Societies.

MR. MECHI'S LECTURE.

Society of Arts, *Nov.* 27.—At a meeting of this Society, H. T. Hope, Esq., M P., in the Chair, Mr. Mechi read as follows:—In accepting the invitation of your Council to read a paper on Agriculture, I hope I shall be acquitted of presumption. I consider it to be the duty of every one to express, when called upon, his honest opinion of the present condition and future prospects of our national agriculture, with a view to its amendment. I therefore purpose, in this discourse, to take a general review of our agriculture, adverting to certain practical points of interest, and remarking on my own agricultural position.

I confess that I have a very mean opinion of the present state of our general agriculture (I say general, for there are many brilliant exceptions) as compared with our other industrial occupations, and contrasted with what it ultimately must and will become. It is true that great advances have been made, and that we stand high in comparison with the past, and also, relatively, with many other nations; but we must not forget that formerly, as now, the self-gratulation of supposed perfection has been annihilated by the necessity of providing food and employment for a trebled population. The prospect of a compound multiplication of mortal increase for the future, should warn and forearm us for the impending crisis.

The physical and mental powers of a nation form its original capital. It is labour, directed by the mind, that feeds and clothes us, and procures for our social adjustment, the metals which form the accepted standard of our currency. Therefore, the more numerous and concentrated the population, the more wealthy the nation, provided means are found for its employment. Can it be denied that we have yet, in this United Kingdom, a wide and untilled field for agricultural labour and investment? Look at our statistics of moor, bog, and waste. Oh, but I am asked, can these be profitably reclaimed?

Request the poor peasant squatter to show you his cottage garden or allotment on such soils, and conviction will at once reach you.

Carry your remembrance to the reclaimed rabbit-warrens and quadrupled rentals of Norfolk and Lincolnshire; to the once sedgy, swampy wilds and wastes of the great Bedford Level, drained by mighty steam, which even now is doomed to be superseded by a costly and enormous but profitable estuary. See the warps of Yorkshire and Lincolnshire; the irrigations of the Edinburgh meadows, with its annual rental of from 15*l* to 20*l*. the Scotch acre; the Portland Water meadows, and watered wastes of Teddesley. Take, for evidence, the Woburn Sands, Chat Moss, Dartmoor, and endless other proofs, and then can you doubt that human labour, well directed, is profitable in agricultural progression?

But I am bound to give reasons for my dissatisfaction with our present agriculture. Here they are:—The first and most direct evidence of the low scale of farming, is the gross acreable produce of the United Kingdom. I have good reason to believe that the very largest estimate per acre, taking into account the poor grass and arable lands, and leaving out market and other gardens, does not reach 4*l*. per acre. A reference to Spackman's Occupations of the People, to the agricultural reports of parliamentary committees, and other statistical works, will show that the rental of the United Kingdom (excluding towns), will certainly not reach 15*s*. per acre. Taking, therefore, as a gross return, 5 rents (4 would be nearer the truth), it is clear that 3*l*. 15*s*. worth of produce per acre, is far too liberal an estimate; 3*l*. 15*s*. from one whole acre of land in the nineteenth century!!!

What each acre might produce by the application of more drainage, more manure, more labour, and deeper cultivation, more live stock, and better buildings may be inferred by facts constantly obtruding themselves on our notice. As extreme cases, we may instance the production of 80 tons of Mangold Wurzel per acre, sold at 1*l*. per ton; of large productions of vegetables worth at least 100*l*. to 150*l*. per acre; of 6 to 9 quarters of Wheat per acre, worth, at only 40*s*. per quarter, from 14*l*. to 18*l*. Even this year, some acres of my own Potato land have yielded 15*l*. per acre, at the low price of 1*s*. per bushel; and the average of my 80 acres of Wheat will not be less (straw and chaff included) than 10*l*. per acre, on a very miserable soil.

We see by Spackman's tables, that there are in—

	Acres.	Rental per Acre.
England and Wales	36,995,000	21*s*. 8½*d*.
Scotland	18,944,000	5*s*. 1½*d*.
Ireland	20,177,446	13*s*. 5½*d*.

(This estimate includes the rent of towns, and also all the bog and waste lands.)

Now it is quite clear that the mere increase of labour and production to the extent of only 10*s*. per acre, would afford us all food and employment, without recourse to foreign imports. Is this so fearful and difficult an object to attain? I am quite aware that no act of Parliament can compel or control in this free country the application of capital to particular purposes. It must be done by the free will of a free people, and that free will must be inclined and stimulated by public discussion, comparison, and calculation. It is a good sign for agriculture that farming and landlordism are no longer secrets. It is a new but interesting feature that the discussions of our now numerous agricultural societies and farmers' clubs are submitted, through the mighty medium of the local and metropolitan press, to the test of public examination and criticism.

I am not one of those who think that scarcity and high prices are preferable to abundance and cheapness. I hold it as a principle that a nation that can supply itself abundantly with food and manufactures, and still have a large surplus of the necessaries and comforts of life to exchange with other nations for luxuries, is in a happy and prosperous condition. If you differ from me in opinion, test the proposition by its converse.

The multiplication of our industry by means of steam-power, machinery, and railway communication, is an important cause of the wealth of this country. It enables us to produce more than we require, and thus purchase with our surplusage, the silver and gold of the world, the cotton of the West, the silk, tea, and spices of the East, the ivory and gums of the South—and, to our shame be it said, the grain of the North.

It is a disgrace to our agriculture that it produces no superabundance—nay, not even abundance, but leaves us to the mercy of large foreign importations.

It is this that evidences and accounts for the poverty of agriculture. I venture to predict that agriculture will never be rich until it produces superabundantly. This *can* be done, and *will* be done, and must be done, for the concurrence of increased employment and food, with a multiplied population, can alone prevent anarchy and confusion. It is impossible to avoid seeing in every direction, the sluggishness, ignorance, and neglect of our national agriculture. Unlike our manufactures, she has neither availed itself of mighty steam or general science. Enshrouded by prejudice, ignorance, and self-sufficiency, isolated localism has been her curse, but better times are coming. She can no longer withstand the rays of intelligence, or facilities of intercourse, without passing an opinion as to the policy of the late free trade measures. It is quite clear that foreign competition is arousing us from our lethargy. Landlords and tenants, too, are aware that they must produce more food, and at a lower price. This can only be done by the removal of every impediment.

Our landlords will not permit the corn fields to be encumbered with miserable pollards and worthless timbers, which can be grown in the wastes of Canada, at one-tenth the cost of producing them here. They will no longer find tenants able or willing to pay high rents for undrained lands, on which there are no conveniences or buildings for the housing and maintenance of an abundance of live stock; there will be corn-rents, liberal covenants, a just valuation of tenants' improvements, and an encouragement to permanent occupation, by good and improving tenants. Tenants will have to keep more live stock, make and buy more manure, and take more care of what they do make. There will be more labour employed and less weeds grown. Deep and frequent cultivation, by improved implements, will combine the utility of a fallow with a growing crop.

I have been forcibly struck with the prejudices and inconsistencies of agriculture.

The railway hedges are neatly trimmed and annually cultivated, like a crop of Turnips. If it is profitable so to do, they are thus rendered effective as well as neat. The farm hedges, diverging at right angles from these, have never caught the pleasant infection They still exhibit their huge, irregular, and ungainly proportions; shading and robbing the land, for the mere purpose of growing bushes to stop the gaps caused by their untrimmed and neglected condition.

Farmers dig their gardens 2 feet deep, but only plough their land 5 inches. They take especial care of their nag horse in a good warm stable, but expose their farm horses and cattle to all weathers. They deny the utility of drainage in strong tenacious clays, but dare not dig an underground cellar in such soils, because the water would get in. They waste their liquid manure, but buy guano from Peru to repair the loss. I have known practical men seriously doubt the benefit of liquid manure, who are in ecstacies with the urine of the sheep-fold.

The excretiæ of the vast importations which take place to this country of food and consumable luxuries, ought, if properly economised, to increase annually the fertility of these islands. But when I suggest new buildings, steam engines, drainage, &c., I am asked, "Where is the capital to come from for all these improvements?" I reply, Where *does* the capital come from to make railways and docks; to build steam vessels; to erect a whole town of new squares and streets, and to carry out every other useful and profitable undertaking? I believe the surplus profits of the nation are estimated at fifty millions annually. Every 10 years this accumulated wealth has found vent in rash or dangerous speculations. Fortunately, foreign loans have been superseded by British railways; and I can perceive clearly that the surplus gains of the present times are destined to pass into agricultural improvement. I see, in mental review, a long list of bankers, merchants, shipowners, manufacturers, traders, and professionals, who have become owners or cultivators of our soil. These, not having the agricultural precedents or prejudices of their predecessors, are devoting their powerful means and energetic common-sense principles to the amendment of our agriculture, and the increase of employment and of food. If you see, arising on the ruins of our queer-shaped and antiquated farmeries, a pile of substantial and convenient erections; if you see the smoking shaft and irrigated meadow, depend upon it it is the work of some new possessor. It is a delightful reflection that there is abundant scope for such operations.

The establishment of public companies, with ample capital and sufficient legal powers to improve settled or encumbered states, is also a pleasing event.

It is very singular that we south countrymen let our cannie friends carry off nearly all the first Government Drainage Loan.

But there is one sad and most unjustifiable obstruction to landed investment and amendment. I mean the antiquated and semi-barbarous difficulty of transfer. In all properties possession is *primâ facie* evidence of ownership. It does appear to me a monstrous and intolerable nuisance that the same principles of possession and transfer are not applied to land as to the funds, or any other article of value. A public registry-office, with district maps, would at once obviate the difficulty. Land would then change hands 20 times for once now, and be subjected to a proportionably increased chance of improvements.

A painful question is often asked, "What is to become of the poor farmer?" I reply, what *has* become of the poor hand-loom weaver—of the four-horse-coach proprietor—of the roadside innkeeper—of the turnpike trusts—of the Gravesend sailing-boats—of the old hackney coaches?—even the poor old watchman, who called the hours all night, and cleaned boots and shoes half the day, have given way to the able, active, and efficient new police.

These are days of improvement and progression. Individual interests are no longer permitted to interfere with the public good. Mighty steam has worked, and will still work, great changes. Plenty and cheapness have superseded scarcity and monopoly. Agriculture can no longer withstand the common fate. The poor farmer and the poor landlord, or rather those who are in a wrong position, will necessarily make way for more useful members of society. It is a painful though national necessity.

I cannot concur in the lamentations of those who regret the large importations of human food. Is there any superfluity—any waste? No; it is all consumed, and therefore all required. With regard to the practice of agriculture, there are certain things on which, from experience, I am competent to pass a decided opinion, and recommend as economical and profitable.

The Agricultural Labourer.—The moral and physical condition of our labourers has, in my opinion, a most important influence on our successful cultivation of the soil. They should be the apt and polished tools with which we carry on our work. To me, one of the most delightful results of agricultural improvement has been its good effects in the immediate neighbourhood. I speak practically on this matter, and can testify that the expenditure of my money on a wild tract of bleak and barren heath has diminished crime and conduced greatly to the security of property, and to the moral condition of the hitherto irregular and insufficiently employed peasantry. The want of a better education is severely felt by the men themselves, especially when I have had occasion to send them as drainers to distant counties.

It seems marvellous that, with the example of America before us, we should still leave this great question to the mere chance of individual or local beneficence.

Our Scotch friends manage this matter better, and with economy, too; and, as a consequence, supply us with baliffs and gardeners. I find it advantageous to myself and to my labourers to let every job, task or piece-work. The work is more quickly and cheaply done; the men earn more money; are consequently in a better physical and social condition, and larger consumers of the farmers' and manufacturers' produce.

Every man who values the working condition of his horses, will naturally extend the same consideration to his labourers. It is impossible too strongly to condemn the miserable policy of allowing itinerant speculators to monopolise the housing of our labourers. The social and physical pestilences resulting from these wretched hovels should make us wiser in this respect. Honour be to his Grace the Duke of Bedford, and to others, who have set a brilliant example, by providing ample and convenient residences for the peasantry on their estates.

Good Farm and Parish Roads.—The necessity for facility of carriage is obvious. If you doubt it, I will refer you to a friend of mine, whose father, when a farmer in Surrey, had to send his Wheat to market 20 miles on pack horses, and sell it at 20*s*. per quarter. This was in the good old times, which I by no means desire to resuscitate.

Our parish and farm roads are, many of them, sadly managed. Having shoulders and dishes of water to soak and soften them. They should always be kept slightly rounding, so as to shoot the water, scraped, repaired, and farmed, and drained like our turnpike roads.

Farm Horses should be clipped early and gradually, piece by piece. If you doubt this, try on your plough one clipped and the other unclipped, and you will soon come to a conclusion.

I assume that you will never turn out your horses, but treat them exactly as you do your nag horses, taking especial care that there should be ventilation at the highest point in the stable;—this is well effected by iron air-bricks, worked in with the brickwork.

All their hay and straw should be cut up into chaff, the corn ground into meal, and mixed with it. Two-thirds hay chaff and one-third straw chaff is the right proportion; but cut hay alone does not answer, being apt to ball in the stomach. If their water were always warm, as at the London breweries, they might drink at any time; otherwise it would be as injurious to them as to ourselves to drink cold water when overheated by violent exertion.

Animals never do well under slated roofs, unless you interpose a lining of boards or woollen thick felt, such as is used in shipping. Slates conduct heat *to* the animal in summer and *from* it in winter. Thatching under slate is useful, though apt to encourage vermin.

Old horses do admirably well on cut food and in warm and well-ventilated stables.

We need never lose a horse by gripes, provided we administer, when first attacked, 1 oz. each of spirits of nitre and paregoric in a quart of warm water. I always keep a few doses ready.

Deep Cultivation after Drainage is essential to profitable farming on heavy lands. I effect this by removing the breast from a plough, and let it follow, drawn by a pair of horses, in the track of the first plough. We thus gain a greater depth. In summer, I use a very large plough with four horses to open the work, and follow with another plough and four horses in the same track. This brings up immense clods and blocks of the nasty undisturbed subsoil. When dried by the sun, the Crosskill roller, with 5 cwt. added, cracks them; the scarifier operates, and again the Crosskill renews the attack, all in dry, hot weather, until you have a perfect garden—yellow-looking it is true, but aerated, and deprived of many noxious properties, and ready for mixing with abundant manure and calcareous matter. You thus bid adieu to root weeds that have tormented you for years; you facilitate the percolation of water, air, manure, and roots. Your crops do not dry up in summer or freeze in winter; for it is the drying or freezing of the roots that destroys the plant.

I apprehend that if a pair of horses could plough 2 feet instead of 5 inches, that would have been our general depth of cultivation. This dry summer all the manure for our root crops being within 5 or 6 inches of the surface got dried, and the root crop failed. Not so where it was buried deeper, like garden cultivation, below the solar influences. Our root crops send down their roots many feet in summer, provided the manure is there, as I have proved by examination.

The Potato Question.—I suppose if I grow Potatoes I shall be told that I am not a farmer, but a market gardener. I shall be proud of the appellation; it implies superior cultivation. Surely it will not be objected that Potatoes are not food for man as much as bread and beef, and that a man may not grow what pays him best. The fact is, bad farmers, who do not keep much stock, or buy much manure, dare not grow Potatoes with the ordinary mode of farming. I have heard them say a Potato crop exhausts their land for years. For my own part, I like a heavy exhausting crop. It implies a heavy return, with means for restoring the deficiency occasioned by it. Miserable crops, occasioned by the save-all and cheese-paring principle, cause us to feel severely the pressure of our rent, tithes, and rates. They react on the landlord, labourer, tenant, and community at large.

Drainage.—Little need now be said on this point, as it is generally considered indispensable as an agricultural basis on all wet lands. I hope the prejudice against it amongst heavy land farmers is gradually giving way.

Steam Engines.—If we are to house-feed a large quantity of stock with cut food and ground meal, or ground oilcake, steam power is indispensable. If I stop mine at any time for repairs, I find I am involved in a daily expense of nearly 20*s*. No doubt they will be used to force water and liquid manure for irrigating the soil, as is done advantageously by Mr. Kennedy, of Myremill, Ayrshire.

Perhaps one of the most interesting questions of the present day is the system of Feeding on Open Boarded Floors.—Experience has taught me, and will teach others, that, in order to succeed in farming, we must produce a much larger quantity of meat on our farms than at present, and at less cost. In order to do this advantageously, it becomes necessary to consume a large portion of the straw of the farm, cut into chaff, and cook it with meal and ground oilcake. We are thus deprived of the usual cattle bedding, and must find a substitute. Having practised the system rather extensively, I will communicate to you the details; observing, that although attended, as every system must be, with certain disadvantages, the balance of benefit is sufficiently considerable to induce me to continue and extend it. The quantity of stock I now have on boards is—

100 lambs,	30 bullocks,
50 sheep,	10 cows,
60 calves,	200 pigs.

We are indebted to the worthy Rev. A. Huxable for the idea; but I found his space of three-quarters of an inch between the planks insufficient. I therefore, measured the hoofs of the various animals, and arranged my openings accordingly. Thus,

	Inches thick.	Inches wide.	Inches space.
For bullocks	2½ ...	4 ...	1⅝
„ sheep	1¼ ...	3 ...	1¼
„ pigs	1½ ...	3 ...	1½
„ small pigs and lambs .	1½ ...	3 ...	1
„ calves...	2 ...	3 ...	1⅝

For large Cotswold or Kent sheep, 1⅝ openings would not be too large. 1¼ openings do well for Hampshire Down lambs, but are rather too large for small Sussex Downs.

One cannot too highly appreciate the system on heavy lands, where animals cannot be profitably folded during winter. The area allowed for each animal and its feeding apparatus, is thus:

	Superficial feet.
Small sheep	8
Large ditto	10
Small bullocks	30 to 40
Large ditto	50 to 60
Small pigs	6 to 8
Large ditto	9 to 11

Very much depends on the season and weather. In cold weather, pigs and bullocks can scarcely be packed too close, so long as there is room for them to lie down comfortably. Sheep require a little more room, or ventilation. In fact, it requires a nice observation to adjust the ventilation and temperature. This is best done by a thermometer, because our own feelings are not always a sufficient criterion. Every cattle shed should feel as comfortably warm as a drawing-room. The opening for ventilation should be at the highest point.

Fine bred pigs, having little hair, must have a much warmer temperature than sheep. When pigs huddle together, it is a sure sign that they are not warm enough. Cold, stopping the circulation in the skin, drives the blood to the internal organs, and causes inflammation.

I have often been struck on seeing how soon my groom will get a horse into condition, by warmth, cleanliness, and food. The same remark applies to a lady's lap-dog. My bullocks are groomed daily by a boy, whose sole occupation it is. The cost is about one farthing per head per week, and I am sure it pays. Before I leave the open boards, I should say that the bars or planks may be either of straight yellow deals, or of straight-grained, hard woods. The latter are to be preferred for heavy animals, as they wear off the edges of the deals. The depth of the pits may be from two to four feet. It is necessary, once in a way, to level the manure, to prevent its touching the boards; it would soften them, and cause them to break. I should say that we never sweep the floor; but the animals are perfectly clean. Of course, the manure is taken at once from under the boards to the field, without the interventional expense of a double carting, shooting, or turning over of a dung-heap. The effect on the crops is unmistakeable.

In order to pay you 10 per cent. on your investment for the whole building and floor, complete with troughing, &c., you would charge your bullocks 1½*d*. per week; sheep and pigs, one farthing per week. The cost of erecting covered homestalls, complete with boarded floors, will not exceed 1*s*. to 1*s*. 3*d*. per superficial foot.

One man on my farm feeds, and entirely attends to 250 pigs. It would require two men on the old straw-bed system. Our pigs are never cramped now. Formerly they used to be, owing to the manure heating under them, and the cold air giving those parts rheumatism. One stout lad, at 3*s*. 6*d*. per week, will feed and attend to 30 bullocks; another attends to 60 growing calves.

I smile occasionally at the current belief, that Mr. Mechi is a reckless, extravagant fellow—not at all pinching or farmer-like. An inspection of my future published accounts will possibly show, that whilst my workmen are well paid, my work is cheaply done by the task; and that certain folks have been under a considerable delusion. Before I leave the boarded floors, I must confess that I never like the look of my animals so well on them as I do on a little mountain of clean straw, or a nice green pasture; but this is not a question of fancy, but profit, and I am quite sure that the system is very advantageous. It is true we like a soft bed, and so do the animals; but our medical advisers recommend a hard one.

There is a very powerful development of the muscles on boards—so much so, that with fattening pigs, not bred on the boards, I have found some of them get capped hocks. It is surprising how quickly you may fatten young pigs on these floors. They find it inconvenient to run about, so divide their time between eating and sleeping—a most agreeable operation for the account-book. I think the time is coming when farmers will consider the question of how much meat a ton of Turnips or hay will make under various circumstances. If so, the turning-out system will be given up. My old-fashioned bailiff admits that, on the turning-out system, two-thirds of my farm would be required to feed my animals. Now they make shift with one-third. If you desire a good appetite in your animals, turn them out for exercise in the cold. I tried the turning-out system with some calves. On asking the boy how they got on, he replied, "Oh Sir, they get on properly well now, they come in so hungry." This settled the question in my mind; but those who doubt the fact can make experiments.

There can be no doubt the animals are perfectly healthy on these boards. Considering the confinement and heat, this rather surprises me, especially with the pigs, fed entirely on meal; for the ammonia, or effluvia, from under them certainly is powerful enough to discolour the paint. The great difficulty I find is in getting a proper fixer for the ammonia. I have used sulphuric acid, ashes, and various matters, with a certain effect. I hope the Irish peat-charcoal will not be too dear. I have a ton coming on trial. After all, I am inclined to think common salt, or the common dried clay, are best and cheapest fixers, and I have used a great deal. I can buy the salt here for 30*s*. a ton, and, when mixed with the manure, it gives us muriate of ammonia and carbonate of soda—most valuable salts. I am also about to try Mr. Lawes's dissolved coprolites. To waste our ammonia is an act of agricultural insanity.

Another question connected with the boarded system, is the fly question. Where you have plenty of food, warmth, and stock, you will have abundance of flies. My bullocks could never lie down in the daytime, owing to their attacks; and, of course, the continued lifting of their feet prevented fattening. By darkening the feeding-houses, I entirely removed this nuisance, and had the gratification of putting my animals in a most profitable state of repose; for, if you have 10 millions of flies, not one will bite in the dark. I find that some of my friends, who value the condition of their horses, have long practised this system. It is essential to the successful house-feeding of green crops with bullocks during summer. Sheep are never struck by the fly on boards, and pigs do not seem much annoyed by them.

To those who consider me "too fast," and are not prepared to go with me in boarded floors, I would say, by all means then have covered homesteads, such as may be seen at the Rev. Mr. Cooke's, of Semer, near Hadleigh, Suffolk; and at Mr. James Beadel's, Broomfield Lodge, near Chelmsford, Essex. I believe either of these gentlemen would kindly show them; and I am quite sure they will bring home conviction to the most resolute defender of the old and unprofitable open yards.

I believe it is the great quantity of stock kept that enables the Lothian farmer to compete at so great a distance with the south country farmer; and I believe it is the still greater quantity of stock kept by Mr. M'Culloch, of Auchness, that enabled him to surpass the Lothian farmers. Mr. Lawes has shown most indisputably, in his admirable papers in the Royal Agricultural Society's Journals, that we can produce manure cheaper and better by feeding stock, than even by purchasing guano. I mean, not feeding on Turnips alone, but using the productions of the farm in conjunction with purchased food.

Whilst searching for facts to guide me to the most profitable mode, I met with the accounts of two farms, variously managed, which confirm, by comparison, my own impression, that on the quantity and management of our live stock depends much of our success in farming.

For your information, I annex a comparison of Mr. M'Culloch's Auchness farming, with a similar one in Suffolk.

Income and Expenditure of a good Average Mixed] Soil Farm in Suffolk.

Expenditure.	£	s.	d.
Rent, 28*s*.; Tithe, 7*s*.; Rates, 3*s*. 6*d*.	481	5	0

Do. floating capital, 2500*l.* at 5 per cent.	125	0	0			
				225	0	0
Sum chargeable against the farm				1851	10	0
TENANT'S REMUNERATION				718	6	0
				£2569	16	0

INCOME.		£	*s.*	*d.*
22 Acres Oats, 50 bushels p. acre, all consumed by the horses.	1100 bush.			
55 Acres Wheat, 38 bushels per acre	2090 do.			
Off seed	163			
Disposable	1922 at 5*s.*	480	10	0
92 Acres Potatoes, 400 tons, sound roots, at present worth 3*l.* per ton		1200	0	0
Besides small Potatoes for seed, sufficient to plant an equal breadth.				
91 { 1 Acre Italian Rye Grass reserved for seed		5	0	0
91 { 50 Acres Turnips.				
91 { 15 Do. grass cut green for house feeding.				
91 { 25 Do. pasture.				
For feeding the following STOCK, viz.:—				
44 Cattle which were bought in June, and have been already sold at an advance of 5*l.* 5*s.* per head on price paid for them	£231 0 0			
86 Cattle in course of feeding, at 5*l.* 5*s.* per head advance	451 10 0			
208 Wedders, at 9*s.* per head advance	93 12 0			
52 Hoggets, at 7*s.* do.	18 4 0			
6 Cows, produce	60 0 0			
4 Young horses, each 5*l.*	20 0 0			
6 Ewes	10 0 0			
Produce of 91 acres, besides manure		884	6	0
		£2569	16	0

N.B.—The large sum for purchased manures will be reduced next year by at least one-half, on account of the additional quantity of manure accumulated by the system of house-feeding in summer; and, it is believed, that by the further extension of the system, the farm will be able in a year or two to dispense altogether with the expenditure for purchased manures. It must also be noted, that no credit is taken for the increased bulk and richness of the dung arising from the consumption of the purchased food charged in the above account. The stock is not insured.

DAVID M'CULLOCH, Auchness, January 17, 1850.

An examination and comparison of the foregoing statements, afford some very striking and instructive conclusions. The Suffolk farm—of a superior quality, employing capital and labour equal to the Auchness farm—shows a considerable loss, whilst the latter produces an ample profit. Now it will be admitted, that neither Free Trade nor Protection can have anything to do with this comparison. Nor are there any "peculiar advantages" to object with; because, if the Auchness farm has superior and convenient buildings for stock, the Suffolk land was naturally superior, and in previous good cultivation, whilst the Auchness farm, much of it naturally poor, has had to be improved at the tenant's cost. In the Suffolk farm there is no purchased manure or imported food. On the Auchness farm, we have 719*l.* so expended. On the Auchness farm, the amount of meat made is 84*l.*—being the produce of 91 acres, and the purchased food. On the Suffolk farm only 352*l.* was received for meat, although 111 acres were used for that purpose.

On the Auchness farm 1680*l.* worth of corn and Potatoes was sold for the consumption of man. On the Suffolk farm only 793*l.* was the value of the grain crops for the horses. Here we have a clear explanation of the cause of success in one case and failure in the other. In one we see the animals housed, warmed, ventilated, groomed, their food cooked, and the utmost made of it, chemically and physiologically. In the other, the usual mode of turning out, and consequent waste and misapplication of food. Here we have a dependence on the natural production of the soil, unaided by imported food or manure, and consequently a minimum production with almost a maximum expense. There a constant addition to the productive powers of the soil, with a maximum produce, and consequent diminished per centage of expense. I need hardly say that I shall, in my own practice, follow the farmer who makes money, and not he who loses it. Our success as farmers evidently depends greatly on our making the most of our root and green crops.

The great question of the value of a ton of Turnips in its meat-making powers, can only be solved by the variety of modes in which it is applied to nutrition. The estimate of value by different persons is from 2*s.* 6*d.* to 12*s.* per ton. In Norfolk, where house-feeding with oilcake is extensively practised, its estimate is about 7*s.*, varying, of course, in some degree, according to the price paid for lean stock. In my neighbourhood they are frequently purchased for house feeding at 10*s.* to 12*s.* per ton; whilst for open or field feeding, they only command from 1*s.* to 3*s.* 6*d.*, and the manure left. I know frequent instances where large flocks of sheep have consumed whole fields of Turnips, coming from them absolutely leaner than before. Cold, wet, and comfortless, the frozen Turnips acted as a purgative, being unaided and unconnected by dry hay, oilcake, or warmth or shelter. The value of the Turnip crop was here absolutely nothing, and an enormous loss attended their production. I apprehend the average cost of producing Turnips, all charges included, is not less than 10*s.* to 15*s.* per ton;—quite that under the old Essex system of five to eight ploughings, although much cheaper plans are adopted in some districts. In a discussion I had some time since with the members of the Harleston Farmers' Club, I endeavoured to show and prove, that it was considerably cheaper and more advantageous to make meat with purchased corn, cake, and hay, than with Turnips alone, administered in the too usual slovenly and unprofitable way. Remember that by feeding animals at home with purchased food in conjunction with your own produce, you are constantly adding to the productive powers of your soil. The time is come when always selling off the farm without replacing, will not stand the external competition of a different and improved system. The poor heavy-land farmer, with his year's long fallow and two years' charge on one mediocre grain crop, must succumb; and his landlord will find that, without drainage and sufficient buildings for the house-feeding of an increased quantity of stock, his tenants on such soils cannot pay the old rents, or compete with the poor but better managed light lands of our Eastern districts.

I will now proceed to take a review of my own agricultural position. The publication of my agricultural proceedings has naturally exposed me to public criticism. All sorts of motives, good, bad, and indifferent, have been imputed to me. Of this I do not at all complain. I considered my farm, in its original state, neither creditable nor profitable. I expended my capital in its improvement. The result of that expenditure was a decided benefit to my fellow-creatures. My agricultural opponents say the money was thrown away, the property not improved, and that I am losing much money by farming. In order to test the correctness of these opinions, I have, under the advice and suggestion of my friends, submitted to a valuation by three eminent surveyors, whose character and capabilities are beyond cavil. I am informed (though I have not received the official document), that they have fixed my rent at 36*s.* per acre, adding another 7*s.* per acre for the use of my machinery, &c. Now, as plenty of land, such as mine was in its unimproved state, can be hired for 12*s.* per acre, it follows clearly that the fee-simple of my estate is more than trebled in value, leaving out of view altogether the extra expenditure for my own personal convenience. Whether I shall be able, with present prices, to pay a rental of 43*s.* per acre, besides tithes and all other charges, as well as a profit on my tenant-capital invested, remains to be proved. My incoming valuation as a new tenant was effected on the 30th of October, by the same gentlemen who set my rent. On the 30th of next October, and on all similar periods, so long as I continue to farm, my outgoing valuation will also take place. The much-desired balance-sheet will appear in the public prints, either for good or for evil, as the case may be. It will either be an example to follow or a beacon to avoid. It will be done in honesty and good faith; but it would be premature now to prejudice its results. I wish, for many reasons, that it may be satisfactory.

The fixing of the rental being *un fait accompli*, may be commented upon, and presents an encouraging feature to improving landlords. I have no doubt but the valuers naturally considered that drainage, good roads, open fields, unencumbered by useless fences and trees, deep cultivation, and good manure, all have a material influence on the business of farming; and that without good and ample buildings, abundance of water, and proper steam machinery, it would be impossible to accommodate and provide for so large a quantity of stock as I deem it necessary to keep. No doubt the means for economising their manure did not escape their observation.

I had hoped to have placed before you a complete model of my farm buildings, which is preparing for the great Exhibition. It is not, however, sufficiently advanced; I therefore merely produce a portion—showing the boarded floors. My valuation as a tenant-farmer has not yet been sent to me by the valuers, so I cannot at present produce it.

The facilities for acquiring agricultural science are now great. We have now the opportunity of rubbing mind against mind, and eliciting bright scintillations of intelligence. The priceless volumes of the Agricultural Society of England and Scotland, to which every farmer should belong, the agricultural press and periodicals teem with novelty and science, and bear unquestionable testimony that the agricultural community can no longer be a non-reading class. The Royal Agricultural College at Cirencester, and other similar but minor establishments, invite the juveniles of agriculture to excel their parents.

In conclusion, can it be possible that England, great in wealth, liberty, and industry, superabundant in capital and labour, and superlative in manufactures and machinery,—I say, again, can it be possible or permissible that Britain, with all these advantages, with merchant princes and baronial traders sweeping the seas, with her navy and merchant fleet, shall be humbly dependent for her daily bread on strange and foreign lands?

I will never believe it can continue. I will never believe that British enterprise cannot and will not compete with the ill-fed vassalage of mere corn-producing countries. Countries, whose people cannot afford to eat the Wheat they send us; and whose agricultural practice, tested by our own, ranks low in the scale of comparative perfection. I cannot believe that our wealthy and patriotic aristocracy will any longer permit such an anomaly to continue.

In conclusion, I commend to your especial regard the noble practice and improvement of agriculture, as beneficial to health, as conducive to longevity and mental repose, and as full of independence; presenting to your mind, through the charming and ever-varying face of Nature, the impress of Almighty Goodness and Wisdom. I commend it, not only on the low ground of individual profit, but by employing and feeding the people, as a means for promoting the moral, social, and political strength of this great and happy nation.

HIGHLAND AND AGRICULTURAL, *Nov.* 20.—*The Substances which can be most profitably employed as auxiliary for Turnips, in Fattening Cattle and Sheep.*—Mr. BRODIE, Abbey Mains, said: There are few questions in the economy of farm management of greater importance, or more intimately connected with the successful cultivation of the soil than this. I have to regret that the range to which I have conducted experiments is comparatively limited; nor has the subject in all its varied bearings received those careful experimentary trials which enable one to speak with confidence on any of the many questions which are involved in its discussion. The discussion to-day may possibly tend to elucidate the subject, but a complete and satisfactory solution of it can only be obtained by a series of varied and carefully conducted experiments, experiment being the best form by which our knowledge can be extended on a subject involving so many different considerations. The subject is one of the greatest importance to the community, as well as to the agriculturist; for, since the fall that has taken place in the price of grain, the capital which is thus employed must be very great—some farmers using extra keep at the rate of 1*l.* per acre over the whole extent of their holding. A few of the most celebrated of our farmers are of opinion the most profitable method of cultivation on some soils is to remove only the half of the Turnip crop to fatten cattle, and consume cake and corn equal to the other half, along with the Turnips; while the sheep stock folded upon the portion left, receive also a quantity of extra keep equal to the whole Turnip crop, and fattening at least double the quantity of stock that under ordinary circumstances they could be enabled to do; and if we take into consideration that in the cultivated districts, where the fattening of stock has become a regular part of farm management, the employment of extra keep, along with the Turnip crop, has to a degree also become a part of such management. The annual consumption of such substances must therefore amount to some millions, as there is scarcely a farmer, however small his holding, who does not use some substance along with his Turnip crop, either with the view of eking out that crop, or finally preparing his animals for the butcher. Some farmers resort to extra keep to avoid selling in dull or bad markets, calculating on a rise in price, to remunerate them for their risk and extra expenditure, while not a few consider this the cheapest and best method of enriching and maintaining in condition weak or naturally comparatively barren soils. Notwithstanding this, there are few farmers, who have adopted a peculiar system of feeding by extra keep, by either one or more substances, that have done so upon a decided conviction that the practice is really remunerative. We believe the majority satisfy themselves with a vague opinion rather than a definite conclusion; and this arising from the absence of that careful recording of expenses and returns, which in no department is more essentially necessary than in the feeding of stock. The fattening of stock with other substances, as auxiliary to Turnips, involves a number of important questions. What substances are most profitable for feeding, and what for manure? The importance of the latter question may be inferred from the fact that, in different parts of England, where compensation is allowed for unexhausted improvements, the value of the manure of oilcake-fed animals is estimated at about half the original cost of the cake, and in many of the best feeding districts of Scotland farmers are not unwilling to allow 30*s.* or 40*s.* per ton for the oilcake that may be consumed in eating off the Turnip crop. The increased value of the manure from stock so fed is thus acknowledged, but it is a matter of regret that not more information has been obtained with reference to the exact manurial value of the different substances thus employed. As proving this we may remark that during the discussion on Mr. Pusey's Tenant Right Bill, the question was discussed whether the value of the manure of grain-fed animals was equal to that of those fed on oilcake. On the second reading a clause to this effect was inserted, which was again rejected. We merely mention this circumstance to show the little exact information which is had on this important point. It is possible that too high a value has frequently been placed on the permanent and superior effects produced by the consumption of such substances in a manurial point of view. No subject is more deserving of the most careful set of experiments, and perhaps the Society may consider it deserving of an early place in their list of premiums. Before entering on the second question to which we have referred, namely, the fattening properties of the different substances employed as an auxiliary of the Turnip crop, it may be worth while mentioning the different substances thus employed; and the following, we think, almost exhaust the list: Linseed, the seed of Flax; Linseed-cake, now generally termed oilcake, the refuse of crushed Flax-seed, after the oil is extracted; Poppy-cake, the refuse of crushed Poppy-seed; Rape-cake, the refuse of crushed Rape-seed, hitherto used only as a manure. The above may be considered oleaginous substances. Oats, Barley, Beans, and Peas, white Peas (foreign), Tares generally foreign. The above may be termed farinaceous substances. *Distillery offals*—Hay is generally considered in Scotland as extra

food. Grains are generally given whole to sheep, but when given to cattle they are generally reduced to meal; and upon this we may remark, that every description of grain should be ground fine, particularly Beans, otherwise the cattle will not obtain the full benefit. Linseed should be either crushed or boiled into a jelly for cattle. But the use of this valuable substance is not yet so extensive as its value entitles it to be. There is often considerable trouble in preparing it. It is to be hoped that a more extended cultivation of Flax in this country, with the improved modes of preparing the stalk, and saving the seed, will obviate this, and also increase the supply. The usual quantity given to cattle as a mixture, is between 2 and 3 lbs. daily; to sheep ½ to 1 lb. In East Lothian, Linseed-cake was not much known till about 18 years ago, when it came more into notice as an auxiliary to Turnips, since that time the consumption of it has rapidly increased. Large importations have arrived from the Continent, particularly from the Baltic, within the last few years; cake of superior quality has come from America, and home-made cakes have been extensively manufactured to meet the increased demand. The price of foreign cake used to range about 8*l.*; home-made about 10*l.* per ton. Since the alteration of the import duties on grain, a great fall has taken place in its price. Home-made cake is generally about 30*s.* per ton higher. We consider, however, good foreign about equal to home-made, and have generally used it. It is now extensively used in almost every feeding district, and particularly in the best districts of England. From its relative high price, and the great demand, we believe it is much adulterated. We are also of opinion, that from the improved modes of extracting the oil, now in use, its value has also diminished and its fattening qualities lessened; the price and quality vary much according to the abundance and deficiency of Flax-seed, and the demand for oil, and therefore farmers should compare it with the price of grain at the time; this is the more necessary at present, the price of grain being so low, and the value of oil having been, for some time, rising considerably. We know several very intelligent farmers who consider the values of Linseed-cake and grain for fattening qualities to be equal, weight for weight. I am myself inclined to give the preference to Linseed-cake, particularly when of good quality, but not relatively to the present market prices of the articles. My opinion of the value of oilcake is higher than that of some of my most intelligent neighbours, but I shall mention in explanation that I uniformly use the highest priced foreign oilcake, and when I speak of its slight superiority to grain, it is only with reference to oilcake of the best quality. I am convinced that inferior oilcake is not superior, weight for weight, to farinaceous substances, particularly when mixed. I need scarcely remark what a saving this would give in the expenditure of the farm were this fully confirmed by experiment, as no less than about a million of tons of Linseed-cake are annually imported into Great Britian. In other words, something like five millions of money is expended by farmers on this substance. Poppy-cake, the refuse of crushed Poppy-seed, was introduced a few years ago for feeding purposes; its price is about 5*l.* per ton, at which there is a considerable demand. Rape-cake has been but little used as feeding; its relative price to Linseed makes it a matter for further inquiry. Owing to its bitterness, it should be given as a mixture; it generally sells from 3*l.* to 5*l.* per ton. Oats have hitherto been rather neglected in the feeding of cattle, but within the last year or two, their value for such purposes has been more fully appreciated, and will, in all probability, become more so. The present price is about 5*l.* 12*s.*

Beans and Peas.—Beans have been long esteemed the best article of the produce of the farm for fattening cattle, and are still extensively used. Present prices about 6*l.* 5*s.* The Tares generally used in East-Lothian are of foreign growth, and frequently much damaged. The price varies much. When they can be obtained at a low price, say about 4*l.* to 5*l.* per ton, they may be advantageously used. The same may be said of white Peas; much used in England for feeding. *Barley.*—Light and stained Barley can often be purchased at a low price; much of it is used in England, and there sometimes sprouted before using. As a mixture it is highly valuable; present value about 5*l.* 10*s.* Inferior samples of foreign Barley, Oats, &c., may occasionally be had at a very low figure. Indian Corn was expected, on its introduction, at the present duty of 1*s.* per quarter, to be made extensively available for feeding purposes; but hitherto its high price has prevented its adoption, except in a few cases of experiment, and these serve to show that, at present rates, it is considerably higher than the other substances mentioned above. Bran generally sells above its real value for fattening. Distillery offals are of varied quality, and from recent improvements in the manufacturing of spirits are now of much less value as an article of feeding; their weight is also a barrier to profitable and extended use. The most important part of the subject remains to be discussed, viz., the relative values of different substances employed in the fattening of cattle and sheep. An experiment which I made with the greatest care, and the results of which appear in the Transactions of the East Lothian Agricultural Society, may perhaps be regarded as contributing something to a settlement of this question. I may also state that, though I cannot give to the Society as full details of the experiments which I have made since that time, yet the whole of my experiments since have confirmed the results, and I have uniformly acted upon them in my general practice. In this view, the experiments, though made a good many years ago, may perhaps be regarded as on this account the more valuable.

(To be continued.)

Notices to Correspondents.

BORING INSTRUMENTS: *Sandy Soil.* Any large ironmonger will supply you or procure them for you; Mapplebeck and Lowe, of Birmingham, for instance.

BURNING CLAY: *Sandbach.* We have had no experience; but there has been ample experience of the advantage of the plan. See Journal of the Royal Agricultural Society: Vol. iii. 323; iv. 267; v. 12, 113; vii 142, 245, 297; viii 46, 77, 317.

CHALKING: *W C J.* Your question has unfortunately arrived too late for a detailed answer this week; but, in the meantime, we refer you to the Notice in column *a*, page 734, where you will see that your inquiry had already received attention.

FLAX: *Sub.* Read T. K. Short's sixpenny book; or wait till our next volume, and we will give you a paper on the culture of each of our farm crops in succession.

HORSES: *J K Lewis.* "Stable Economy," by J. Stuart, V.S.

MANGOLD WURZEL: *G H.* To use them instead of Swedes would, at this season, make the sheep fall back. If you give Beans with them, instead of Oats, the laxative tendency of the watery root might be more effectually checked.

MANURING: *Inquirer.* The constant use of quick-lime in compost with the earth of headlands—for use broadcast over Grass-land, cannot balance the loss which such lands, as ordinarily treated, sustain Probably the best way to ascertain if Grass-lands require lime is to try a small portion for a year or two, before the general dressing is intended.

MARL: *Mayo Sub.* The specimen sent contains much lime, and will doubtless prove a useful top-dressing. You may apply almost any quantity usefully on peat—100 cart-loads per acre.

POND-MUD: *L C K.* It may be used as the basis of composts. Mixed with salt, gypsum, guano, or dung, it may be used beneficially on Grass and arable lands. There is no need for leaving it longer than a single winter.

POOR CLAYS: *Cantab* We know no work specifically on this class of soils. See an article on the subject at page 603.

SALT: You may add salt to the dung-heap at the rate of 2 cwt. or 3 cwt. to the quantity intended for one acre of land. It is not injurious to the Potatoes. Skirving's Swede, Orange Globe Mangold Wurzel, Jersey Cattle Parsnip, are the best sorts of seed.—A bushel will weigh probably about 70 lbs. or 80 lbs. We speak from judgment of the weight of a cart-load. They may be put on frosty Turnips; they often are, but should have hay with them. Dorset sheep and lambs may be folded on Turnips so long as ordinary weather lasts.

SHEEP SEIZED WITH GIDDINESS: *Sub.* We are very much disposed to think there must be some connection between the Sow Thistles and the disease, although we cannot recollect any similar instance, and are unable to find any analysis of the Thistle that will assist our hypothesis. *W. C. S.*

*** Communications reaching town after Wednesday, cannot be answered till the following week.

Markets.

COVENT GARDEN, Nov. 30.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are quite equal to the demand. Oranges and Lemons are plentiful. Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. The latter are rather dearer. Lettuces and other salading are sufficient for the demand. Mushrooms are still scarce. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Fuchsias, Mignonette, Tulips, Dahlias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4*s* to 6*s*
Grapes, hothouse, p. lb., 3*s* to 6*s*
— Portugal, p. lb., 8*d* to 1*s*
Pears, per doz., 1*s* to 3*s*

Thyme, per bunch, 2*d* to 3*d*
Parsley, p. doz. bun., 1*s* to 2*s*
— Roots, p. bdls., 9*d* to 1*s*
Marjoram, per bunch, 2*d* to 4*d*
Mint, per bunch, 2*d*
Watercress, p. 12 bunch., 6*d* to 9*d*

SMITHFIELD, MONDAY, Nov. 25.

We have a large supply of Beasts. Trade is dull, and lower prices are taken, although a fair clearance is effected, the weather being good. There is by no means a brisk sale for Sheep, but the number being small late quotations are maintained. Trade is hardly so good for Calves. Our foreign supply consists af 793 Beasts, 1080 Sheep, and 102 Calves.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	8	to 3	10
Best Short-horns	3	4	— 3	6
2d quality Beasts	2	6	— 3	0
Best Downs and Half-breds	3	10	— 4	2
Ditto Shorn	—	—	—	—

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	6	to 3	8
Ditto Shorn	—	—	—	—
Ewes & 2d quality	3	0	— 3	4
Ditto Shorn	—	—	—	—
Lambs	—	—	—	—
Calves	2	8	— 3	10
Pigs	3	0	— 4	0

Beasts, 4343; Sheep and Lambs, 21,420; Calves, 131; Pigs, 390.

FRIDAY, Nov. 29.

Trade is about the same as on Monday for choicest Beasts, but hardly so good for inferior kinds. Several of the latter remain unsold. The supply of Sheep exceeds the demand; prices are rather lower except for the best qualities. Calves are more plentiful, trade is slow at Monday's quotations. Our foreign supply consists of 310 Beasts, 2080 Sheep, 199 Calves, and 20 Pigs. We have 85 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	6	to 3	10
Best Short-horns	3	4	— 3	6
2d quality Beasts	2	4	— 3	0
Best Downs and Half-breds	3	10	— 4	2

POTATOES.—SOUTHWARK, Nov. 25.

The Committee report that since the last report, owing to contrary winds, the arrivals have been limited, which enabled salesmen to realise the highest quotations Present prices:—York Regents, per ton, 80*s.* to 90*s.*; Scotch do., 55*s.* to 70*s.*; Wisbeach do., 65*s.* to 75*s.*; French, 65*s.* to 70*s.*

MARK LANE.

MONDAY, Nov. 25.—The supply of Wheat by land-carriage samples from Essex and Kent this morning was moderate; fine qualities obtained the rates of this day se'nnight, but some of the cold and inferior descriptions remained unsold at a late hour. Business in foreign was very limited, and its value remains unaltered.—The prices of Barley, Beans, Peas, and Oats are the same as last quoted, but the inquiry for either is less active.

FRIDAY, Nov. 29. — The arrivals of all grain this week have been moderate. This morning's market was very thinly attended, and the English Wheat left over from Monday was only partly disposed of, the terms being barely equal to those of that day. Business in foreign was limited, but holders are very firm.—The middling qualities of English Barley are neglected, but other descriptions and foreign meet a fair sale. —Beans and Peas are unaltered in value.—Our quotations for Oats are fully supported.—Flour is in moderate demand only, but prices are unaltered.—A small business has been done in floating cargoes of Wheat at late rates; for Galatz Maize a trifling advance is insisted upon.

LIVERPOOL, FRIDAY, Nov. 22.—At our market to-day the tone of the Wheat trade disappointed in some degree the anticipations of holders, millers being on the reserve. Of course the transactions in any description of English, Irish, or foreign Wheat were upon a limited scale, and Tuesday's rates scarcely sustained. French Flour maintained late prices, but in Irish little business was done. Barley, Malt, Beans, and Peas appeared to remain as described on Tuesday. Oats and Oatmeal were in moderate request, the former fully supporting, but the latter hardly realising the extreme rates of Tuesday. Indian Corn commands a steady inquiry, American yellow realising 30*s.* per qr.——TUESDAY, Nov. 26.—The aspect of trade at our Corn Exchange this morning evinced no lively feature in any of its departments. With the exception of a few parcels of Wheat taken for Ireland, the transactions in any description were very limited in amount, and although we are scarcely warranted in reducing our quotations, prices were decidedly in favour of buyers. Malting Barley receded 1*s.* per qr.; grinding samples were the turn dearer. Malt steady. Beans and Peas in slow request, and the former easier to purchase. Oats were held at an advance of 1*d.* per 45 lbs., which was partially paid. Oatmeal firm, at late quotations. Present prices: Wheat, English red, per 70 lbs., 5*s.* 7*d.* to 6*s.* 3*d.*; white, 6*s.* 0*d.* to 6*s.* 6*d.* Barley, Scotch and Irish, per 60 lbs., 3*s.* 0*d.* to 3*s.* 3*d.* Malt, English, per qr. pale, 50*s.* to 55*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 9*d.* to 3*s.* 0*d.* Beans, English, per qr., 27*s.* to 31*s.* Peas, do. do., 29*s.* to 31*s.*

PLOUGHING SEASON—THE TWO GUINEA PLOUGH! Cheapest in the world. Made to suit the times. Warranted. The Wedlake Chaff cutter, surpassed by none; warranted to stand 20 years and upwards. The Grass Mowing Machine; the New Dibber, outdoing all others; the Metallic Churn and American ditto. Very liberal discount for cash, to meet the times.—118, Fenchurch-street, Mark-lane. Actual manufacturers.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
Incorporated by Act of Parliament. 12 and 13 Vict. c. 91.
With limited Liability to Shareholders.
Capital—£100,000, in Shares of £20 each.
Directors.
HENRY KER SEYMER, Esq., M.P., Hanford, Dorset—Chairman.

Central Engineers and Surveyors.
Messrs. J. Bailey Denton and Henry Drake.
(Assisted by eminent Local Surveyors).
Secretary.
WILLIAM CLIFFORD, Esq.
Temporary Offices—No. 46, Parliament-street, Westminster.

The Powers of the Company enable the owner of a Limited Interest in Land, by a cheap and simple process, to carry out every kind of permanent Improvement thereon, either by the application of his own or the Company's funds, secured by a terminable yearly charge on the Inheritance; but the absolute owner of the freehold may enter into any agreement with the Company for the exercise of any of its powers, machinery, or resources.

The powers of the Company may be thus enumerated:—

1. To execute all works of Drainage (including Outfalls through adjoining Estates), Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

The terms on which the remaining Shares will be allotted are a deposit of 1*l.* per Share, with a liability to be called on for the remaining amount by Instalments not exceeding 2*l.* 10*s.* per Share, at no closer intervals than 3 months. Not more than 10*l.* per Share is likely to be called for during the next two years. The liability of every Shareholder is clearly limited to the amount of his Subscription.

Application for further information, or for allotment of Shares, may be made to the Directors, Solicitors, or Secretary.
WILLIAM CLIFFORD, Secretary.

GARDENERS' CHRONICLE.—To be SOLD, a Set from the commencement, in 1841, to the end of 1849. All well bound, and in perfect condition.—Address, J. M., Office of this Paper.

Preparing for publication, a new edition, with Illustrations, of the NATURAL HISTORY OF SELBORNE. By the late Rev. GILBERT WHITE, M.A. With a brief Memoir of the Author, and Extracts from his Diary and Correspondence. Edited by THOMAS BELL, Sec. R.S., &c.; Professor of Zoology in King's College, London.
London: JOHN VAN VOORST, 1, Paternoster-row.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

HOLLOWAY'S PILLS A CERTAIN CURE FOR DROPSY.—Extract of a letter from Mrs. Leedhum, of Leamington, dated October 15, 1850:—"To Professor HOLLOWAY. Sir,—It is with gratitude that I write to inform you of the wonderful Cure effected in myself, by taking your Pills, for a severe case of Dropsy. The disease appeared about five years since, and notwithstanding the various remedies I tried, and the different medical men I consulted, all seemed unable to check its progress. At last I was so much swollen that I could scarcely walk; at this crisis I commenced taking your invaluable Pills, by means of which, and strict attention to your printed instructions, I am now perfectly cured."—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

THE BEST REMEDY FOR INDIGESTION.
"NORTON'S"
CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Headache, Bilious and Liver Complaints. They act as a powerful tonic and gentle aperient, imparting strength to the stomach, and composure to the nervous system. Sold in bottles at 1*s.* 1½*d.* or 2*s.* 9*d.* each, by A. WILLOUGHBY and Co., late B. G. Windus, 61, Bishopsgate-street Without, and nearly all Medicine Vendors.
CAUTION.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

THE BLOOD.—Our bodies have been entirely formed *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*
PARR'S LIFE PILLS.
It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.
None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

PRICE FOURPENCE, OF ANY BOOKSELLER.
CONTENTS OF THE NUMBER FOR SATURDAY LAST, NOVEMBER 23, OF

Order the Athenæum of any Bookseller.

Shortly will be published, in large foloscap 8vo, 32 pages, price Twopence, No. I. of
FAMILIAR THINGS: A CYCLOPÆDIA of ENTERTAINING KNOWLEDGE, being USEFUL INFORMATION POPULARLY ARRANGED. Illustrated with Woodcuts. How common is it to speak of ours being an inquiring age, and yet how much more common to meet with people well informed in Greek and Latin, who are almost ignorant of the origin and history of the things about them. For instance, we sit at breakfast, and are content to enjoy the comforts around us without knowing, or perhaps caring to know, anything of their history. Now, to give such popular information on familiar things as shall be acceptable to readers of all ages and conditions is the aim and purpose of this work; and it is hoped that it will supply a want, not hitherto felt in any great degree, because we have been content with an exterior knowledge of ourselves and the articles we have in daily use. Perhaps, also, it may be as well to say that this book is not intended to supersede the use of larger and more complete Encyclopædias; neither is it intended to embrace all subjects; but it is designed simply to bring into a small and convenient compass such knowledge of common and familiar things as has not heretofore been treated of in works of greater pretension.
London: HALL, VIRTUE, and Co., 25, Paternoster-row; and all Booksellers.

THE LEEDS TIMES, price 4½*d.*, or 5*s.* per quarter, is one of the largest, best, and most extensively circulated Yorkshire Journals, averaging 5000 copies, or 20,000 readers. Published every Saturday, at the Office, Briggate, Leeds. Advertisements, if not inserted in its columns, fail to come before a great portion of the community. A specimen copy forwarded on receipt of five stamps.
In connexion with this Office (its situation being central), a spacious Saloon is attached, where Novelties, Works of Art, &c. may be exhibited free from charge.
The LEEDS TIMES circulates extensively amongst Gardeners, Florists, &c., and is therefore a valuable medium for Seedsmen and Floriculturists.

Now ready, Part 11, price 2*s.* 6*d.*, of

Just published, price Sixpence,
THE WORKING-MAN'S HOUSEKEEPING BOOK for Fifty-two Weeks. A simple plan for keeping a correct account of Domestic Expenditure and Income; also for showing what each item of Expenditure amounts to in the whole year. Adapted for any year, and for beginning at any time in the year. By the Editors of the "Family Economist."
London: GROOMBRIDGE and SONS, Paternoster-row. Sold by all Booksellers.

In December will be published, in 8vo,
AN IMPROVED SYSTEM OF FARM BOOK-KEEPING; in which will be found Weekly Statements of all the Proceedings of the Year, regarding the Management of the Land; Team and Task Work; Cost of Daily and Yearly Labour; Sale and Purchase of Live Stock, Breeding, and Stall-fed Cattle; Rotations of Crops; Disposal of Farm Produce; Hops, Flax, and Felling of Coppice; the Orchard, Dairy, and Charges of Harvest; Payments and Receipts; Diary of House Expenses; Cash and Running Accounts with Tradesmen, appertaining to the Work in Hand. Containing Separate Accounts for the different Labours of the Farm, from which the Tenant may select whatever especially suits his purpose; thus enabling the Farmer to ascertain, in a most simple manner, the exact state of his concerns. With an Appendix of Weights and Measures, and Useful Tables for calculating the Expense of Dibbling, Hoeing, Draining, Ditching, Reaping, Mowing, and all sorts of Task Work.
By the Author of "BRITISH HUSBANDRY."
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Handsomely bound in cloth, with 93 Wood Engravings, Price 6*s.* 6*d.*,
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well executed little book, on a most interesting subject."
From the Birmingham Herald—"A valuable and indispensable accession to the library of every Biblical student."
From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

ENGINEERING SCHOOL CLASS-BOOKS.
In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,
EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.
By W. D. COOLEY, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.
"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*
"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*
"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*
"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*
COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.
WHITTAKER and Co., London.

PROFESSOR LINDLEY'S INTRODUCTION TO BOTANY
Just published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,
INTRODUCTION TO BOTANY.
By Professor LINDLEY, Ph.D., F.R.S., Professor of Botany in University College, London, &c. 4th Edition, with Corrections and numerous Additions.
It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.
By the same Author,
THE THEORY OF HORTICULTURE. 8vo, 12*s.*
SYNOPSIS OF THE BRITISH FLORA. 12mo, 10*s.* 6*d.*
FLORA MEDICA. 8vo, 18*s.*
London: LONGMAN, BROWN, GREEN, and LONGMANS.

SECOND EDITION REVISED, AND ENLARGED,
Price 5*s.* 6*d.*, cloth,

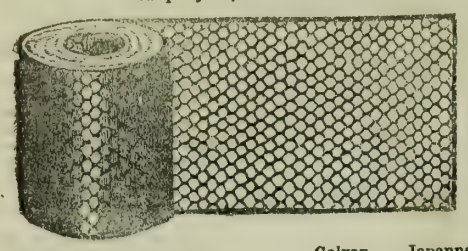
THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS.
By JOSEPH PAXTON, Gardener to His Grace the Duke of Devonshire, &c. &c.
Reprinted from the GARDENER'S CHRONICLE; above 58,000 have already been sold.
London: J. MATTHEWS, 5, Upper Wellington-street, Strand; and may be ordered of all booksellers.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct. (Signed.) "James Fraser, Gardener, Luton Hoo Park."

SMITHFIELD CLUB PRIZE CATTLE SHOW and EXHIBITION of IMPLEMENTS, SEEDS, ROOTS, &c., commences TUESDAY Morning, and closes FRIDAY Evening, 10th, 11th, 12th, and 13th December. Bazaar, King-street, Portman-square. The arrangements this year are upon a more extended scale, and marked by the usual attention to the comfort of Visitors, thereby enabling Ladies to view this National Exhibition with facility.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost ..	£3 15 0
Do. of 100 yards, 24 ins. wide	5 0 0
Do. of 100 yards, 30 ins. wide	6 5 0
Do. of 100 yards, 36 ins. wide	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, Dec. 6, a first-rate Collection of DUTCH BULBS, consisting of the Finest Double and Single Hyacinths, Narcissus, Jonquils, Crocus, Tulips, Gladiolus, &c. Standard and Dwarf Roses, comprising Hybrid Perpetuals, Bourbons, Chinas, &c. A selected assortment of American Plants and Ornamental Trees, &c. May be viewed the morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, Leytonstone, Essex.

FINAL SALE.—TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr J. Smith to submit to an unreserved Sale by Auction on the premises, Dalston Nursery, Dalston, Middlesex, on WEDNESDAY, December 11th, 1850, and following day, at 11 for 12 o'clock precisely, the remaining valuable NURSERY STOCK, consisting of Evergreens, Ornamental Trees, &c. A capital Propagating House, Hot-water Pipe, Slate Tank, Boiler, &c.; the erection of three large Sheds, with Tiles, Bricks, Woodwork, &c.; also a first-rate Van, Iron Roller, Carpenter's Bench; Ladders, Wheelbarrows, Handbarrows, Water Pots, Tanks, Propagating Glasses, Hand Lights, Matted Lights, &c.; together with upwards of 100 sacks of Ash-leaved Kidney, York Regents, Seedling, and other Potatoes; with a quantity of Flower-pots, Rotten Dung, Garden Tools, and sundry effects.—May be viewed, and Catalogues had, prior to the Sale, on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

SOUTHAMPTON.

EXTENSIVE SALE OF NURSERY STOCK, SEEDS, &c.
To Noblemen, Gentlemen, Nurserymen, and Public Companies engaged in Planting.

MESSRS. PROTHEROE and MORRIS have received instructions to submit for unreserved Sale by Auction, on the premises, at Hill and Sidford, and Southampton Nurseries, about the middle of December, the very valuable and extensive Stock of Fruit and Forest Trees; Evergreens, Coniferæ, American Plants, and Deciduous Shrubs; Greenhouse, Stove, and Herbaceous Plants; Agricultural, Garden, and Flower Seeds; Bulbs, Roots, &c.; and every other article in the trade, for which "Page's Nurseries" have been so highly celebrated. Also a Four-wheeled Chaise, Carts, and Horses, Utensils, and Implements of Trade. The day of Sale, with further particulars, will be advertised next week, and Catalogues, which are in preparation, may then be had at 57, above Bar, Southampton; the principal Inns in the neighbourhood; of the Seedsmen in London, and of the Auctioneers, Leytonstone, Essex.—N.B. The valuable Freehold Premises, comprising a capital Dwelling-house in the above Bar-street, Southampton, with an extensive range of Greenhouses, Stores, Outbuildings, and Nursery Grounds, in the rear, extending to Portland-terrace, are for Sale, by private Contract.—Particulars may be had, on application, to William Brooks, Accountant and Estate Agent, 24, Portland-street, Southampton.

TO BE SOLD BY AUCTION, at the large rooms of Messrs. Heard and Watkins, 26, Conduit-street, Bond-street, on THURSDAY, Dec. 5, and FRIDAY, Dec. 6, 200 CAMELLIAS; 700 HYBRID PERPETUAL ROSES, in Standard and Dwarf, Weepers and Climbers; Ornamental Shrubs; Dutch Roots, including Selected Hyacinths Crocuses in variety, Named Tulips, Crown Imperials, Ranunculus, Anemones, &c. &c.

BATTERSEA, SURREY.

MR. D. A. RAMSAY will sell by Auction, on the premises, Claremont Nursery, near the "Duchess of York," Battersea-fields, on TUESDAY, December 3d, 1850, at 12 o'clock, the VALUABLE NURSERY STOCK, comprising fine specimen Arbor-vitæ; Laurestinus, well set with bloom; Yews, Portugal and Common Laurel, Box, Auracaria, &c.; Ornamental Trees and Shrubs; together with an assortment of American Plants, Standard and Dwarf Fruit Trees, Roses, and other Nursery Stock.—May be viewed prior to sale. Catalogues had on the premises; at the "Duchess of York," Battersea-fields; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

TO BE LET, A RESIDENCE and FARM, suited to the occupation of a gentleman. The House and buildings have been recently erected, and are of a superior description. The farm contains about 190 acres of excellent land, half arable.—For particulars, apply to Mr. Fitzherbert, Monk's-Kirby, Rugby.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—Freeman Roe and Hanson, Hydraulic and Gas Engineers: Office, 70, Strand, London.

KNOW THYSELF! was the axiom of the Heathen Philosopher. To acquire this knowledge, and to profit by it, is manifestly the duty of every Christian.—Professor Blenkinsop, who has devoted a life to tracing the workings of the mind in the lineaments of the hand-writing, continues to receive from all classes, philosophers, peers, literary persons, and divines of every denomination, the most flattering testimonials of success in this original art. Address, by letter, with the writing of self or friend, stating age and sex, and enclosing 13 uncut postage stamps, and he will delineate the mental and moral qualities of the writer, whether good or bad. Direction, Dr, Blenkinsop, 10, Lancaster-place, Strand, London.

ELEY and CO., HOT-WATER APPARATUS MANUFACTURERS, HOTHOUSE and IMPROVED PIT BUILDERS, beg to inform the Nobility and Gentry, they, being practical and working men, defy competition, and are enabled to supply their IMPROVED PORTABLE CAST-IRON BOILERS, requiring no Brickwork, being more durable than Copper or Wrought-Iron, and surpass all others. Building and Hot-water Apparatus arranged so that any gentleman's tradesman can fix them, or their own services can be had at a trifling expense. Can be highly recommended by the nobility and gentry, for whom the most complete works have been erected.—The Trade supplied. Estimates free. Boilers of every description supplied. Conservatories in Metal, Iron, or Wood on the most ornamental designs.—Address, City-road, near the Toll-gate, London.

THE BIRMINGHAM CATTLE SHOW will be held in the BINGLEY EXHIBITION HALL, Broad Street, on Tuesday, Wednesday, Thursday, and Friday, the 10th, 11th, 12th, and 13th days of December, 1850.

THE SECOND GREAT ANNUAL EXHIBITION of DOMESTIC POULTRY will take place at BIRMINGHAM, on Tuesday, Wednesday, Thursday, and Friday, the 10th, 11th, 12th, and 13th days of December, 1850.

AGRICULTURAL IMPLEMENT MANUFACTORY.

FOWLER and FRY beg to call the attention of their Friends and the Public to their Stock of AGRICULTURAL IMPLEMENTS, some of their own Manufacture, and others selected from the most approved Makers throughout the country.

F. and F. have availed themselves of the late Sales to lay in a large assortment of the best materials, and particularly a first-rate Stock of Well Seasoned Timber. They have purchased the Registration of Stratton and Co.'s well-known Cylinder and Tumbler Carts, for the conveyance of Liquid Manure. They are about manufacturing from the same patterns the implements for which Messrs. Stratton and Co. were so justly celebrated, viz., Norwegian Harrows, Corn Crushers, Chaff Engines, Read's Subsoil Ploughs, and Carts and Waggons of every description.

Bent Timber of every form furnished on the lowest possible terms.

GUTTA PERCHA DEPOT.

Fowler and Fry beg to inform the Millwrights, Engineers, Machinists, Manufacturers, Shoemakers, and the Public of Bristol and its neighbourhood, that in addition to their Stock of Agricultural Implements and Carts and Waggons of all descriptions, they have made arrangements with the Gutta Percha Company for keeping a large selection of Driving Bands, Shoe Soles, Sheeting Tubing, and the various articles manufactured of Gutta Percha at their Factory, and that they are now prepared to offer them for sale on the most advantageous terms

TEMPLE-GATE IMPLEMENT FACTORY, BRISTOL.
Bristol, Nov. 30th, 1850.

DRAINAGE OF LAND.

JOHN FOWLER, Jun., begs to inform the Nobility, Gentry, and Agriculturists of this country, that he has made considerable Improvements in his Patent Draining and Irrigating Apparatus since the meeting at Exeter, where it gained the Silver Medal of the Royal Agricultural Society; and that he is now prepared to undertake Contracts for the Drainage of Estates, at a scale of prices much below the usual charges. He will undertake the Laying Out and Mapping of the Drains on the most approved plans, and will Contract for the execution of the Work.

J. F. wishes particularly to call the attention of the public to the Cheapness with which Wood Pipes may be manufactured from the refuse Timber found upon estates in such large quantities in many parts of the country, either for the purpose of Draining, or the Conveyance of Sewerage or Liquid Manure, or pure Water for the supply of Farms or Houses; these Pipes can be laid by his patent process, perfectly water-tight, and capable of bearing considerable pressure.

Any parties desiring further information, or wishing to see the Draining Apparatus, will please to apply to

FOWLER AND FRY,
TEMPLE-GATE IMPLEMENT FACTORY, BRISTOL.
Bristol, Nov. 30th, 1850.

Printed by William Bradbury, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 30, 1850

CUTHILL'S "BLACK SPINE" and SNOW'S PRIZE CUCUMBERS at 1*s*. each packet; also his early Scarlet-flesh Melon, 1*s*. Lisianthus Seed, 1*s*. per packet. CUTHILL'S Pamphlet of 56 pages, containing the Belgian Prize Essay on the best way of producing Potatoes; with 12 more articles on fruits and vegetables, among which are Asparagus, Rhubarb, and Sea-kale. The pamphlet has been very favourably reviewed by Dr. Lindley and others. Price 2*s*., or by post, 2*s*. 4*d*. The trade supplied with the Cucumbers.—JAMES CUTHILL, Denmark-hill, Camberwell, London.

*** The Pamphlets can be had at Mr. Ridgway's Book-stand, at the Smithfield Cattle Show, Baker-street.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s*. per dozen. Also Myatt's Linnæus, 12*s*. per dozen; and Victoria, 9*s*. per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

MYATT'S LINNÆUS RHUBARB, strong roots, 12*s*. per dozen; Myatt's Victoria, 9*s*. per dozen; and Mitchell's Royal Albert, 12*s*. per dozen. Extra strong plants of the New Red Currant "Raby Castle," 6*s*. per dozen, or 45*s*. per 100; and Fastolff Raspberry, 10*s*. per 100. With the usual allowance to the Trade. Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, near London.—Dec. 7.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s*. per dozen; smaller ditto, 3*s*. per dozen; or 1*l*. per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s*. 6*d*. each; or smaller ditto, 1*s*. 6*d*. each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s*. per dozen.

True BATH COS LETTUCE SEED, 1*s*. per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s*. per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s*. per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s*. 6*d*. per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

GREAT SALE OF NURSERY PLANTS.

PETER BOOTH, NURSERYMAN, Falkirk, is selling off, at his extensive Nursery Grounds, a very large stock of transplanted LARCH, SCOTCH, and SPRUCE FIR, plants of strong and smaller sizes, including Seedlings, with a great variety of all the other kinds of Forest Trees, Shrubs, &c., generally grown in large Nurseries, of most excellent quality, and at prices much reduced.

COCHIN CHINA FOWLS.

Superb Birds. 10*s*. a couple.

THOS. OLDAKER, Grimley, near Worcester.

Danecroft Rival, very early	1 3
Bishop's new Long-pod, great bearer	1 0
Early Warwick, Early Frame	0 6
Early Emperor, very early and hardy	0 10
Fairbeard's Champion of England	1 0
BEANS, Long-pod and Windsor	0 6
RADISH, early Short top Salmon	1 6
Wood's new early Scarlet	2 0

Their Wholesale List of Prices of the above and all other description of Seeds will be forwarded on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants:

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, remiads one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s*. 6*d*. to 10*s*. 6*d*. each.

CRYPTOMERIA JAPONICA SEEDLINGS.

2 years ... ... 18*s*. per doz., or 105*s*. per 100.
3 years ... ... 30*s*. ,, 210*s*. ,,
1 foot 6 inches to 2 feet 6 inches high, 60*s*. per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90*s*. ,,
3 feet 6 inches to 4 feet 6 inches high, 126*s*. ,,

And larger plants in proportion.

The whole of the above, with the exception of the two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA, var. NANA, a very singular dwarf variety, 10*s*. 6*d*. to 21*s*.

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS. (North of China.)

6 inches high, 10*s*. 6*d*. each; 12 to 15 inches, 21*s*. each.

These plants are from the open border—robust specimens fit for immediate planting.

15 ins. to 24 ins., 31*s*. 6*d*. each; 24 ins. to 30 ins., 42*s*. each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7*s*. 6*d*. each; 9 to 15 inches, 10*s*. 6*d*. each.
15 to 24 inches, 21*s*. each; 2 to 3 feet, 31*s*. 6*d*.

CUPRESSUS LAMBERTIANA, 2 feet, 3*s*. 6*d*. each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy. 1 foot to 2 feet high, 3*s*. 6*d*. to 5*s*. each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s*. 6*d*. each. For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet ... ... 1*s*. 6*d*. to 2*s*. 0*d*. each.
2 feet to 3 feet ... ... ,, 2*s*. 6*d*. ,,
3 feet to 4 feet ... ... 3*s*. 6*d*. ,, 5*s*. 0*d*. ,,

Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s*. 0*d*. each.
Flowering plants ... ... 3*s*. 6*d*. ,,

This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s*. each.

QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s*.

FORTUNE'S YELLOW ROSE, a distinct species, admired by all who have seen it. It would be impossible to describe the combination or richness of the bronze and yellow tints which the flowers present. It is an excellent pillar Rose, and its foliage is distinct. It blooms freely, and in general habit resembles Rugs. Dwarfs, 5*s*.; Standards, 10*s*. 6*d*. each.

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 6 inches ... ... 2*s*. to 2*s*. 6*d*. each.
1 foot 6 inches to 2 feet 6 inches ... 3*s*. 6*d*. to 5*s*. ,,
3 to 4 feet ... ... 7*s*. 6*d*. to 10*s*. 6*d*. ,,

Larger in proportion.

VIBURNUM PLICATUM. (North of China). A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21*s*. each.

WEIGELA ROSEA.

6 inches high ... ... 1*s*. 0*d*. each.
1 foot to 1 foot 6 inches ... ... 1*s*. 6*d*. to 2*s*. 6*d*. each.
1 foot 6 inches to 2 feet ... ... 3*s*. 6*d*. to 5*s*. 0*d*. ,,

These last are fine bushy flowering plants.

Selections of the finest Autumnal Flowering Roses.

Standards ... ... 15*s*. 0*d*. per dozen.
Half Standards ... ... 12*s*. 0*d*. ,,

N.B.—We have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which can be sold very cheap, particulars of which can be had on application.

Bagshot Nursery, Dec. 7.

GRAVESEND.—50,000 TREES AND SHRUBS ON SALE.—Arbor-vitæ, Berberis aquifolium, Cytisus, Cypress, Holly, Jasminums, Lilacs, Laurels, China Roses, &c., 2 to 4 feet, from 15*s*. to 40*s*. per hundred. Standard Roses, 4*l*. to 5*l*.

Aucuba japonica, Arbutus, Cotoneaster, 2 to 3 ft., 12*s*. per dozen; Irish Yews, 3 to 4 feet, 25*s*. Standard Roses, in sorts, 18*s*. to 30*s*.

Large ornamental Trees, for immediate effect, Greenhouse and Herbaceous Plants, in great variety, at low prices.

Apply at the Cemetery, Gravesend, Kent.

"CEDRUS DEODARA" AND "CUPRESSUS TORULOSA ELEGANTISSIMA."

WM. MAULE AND SONS are now prepared to offer, from their large supplies of CEDRUS DEODARA of various sizes, many thousands of fine specimen plants (grown from seed constantly in the open ground and in pots) measuring 3 feet and upwards, unusually fine and bushy, with good leaders, at 60*s*. per dozen; also many thousands of fine plants of CUPRESSUS TORULOSA; the hardy variety Elegantissima in pots, upwards of 2 and 3 feet, at 50*s*. and 75*s*. per hundred; they also abound with good supplies of the Himalaya Conifera generally, together with a large Stock of Scarlet Crimson Himalaya and other hardy Rhododendrons, prices for which will be forwarded on application.

N.B. W. M. and SONS' Lists of prices for Fruit, Forest, Evergreen, and other Trees and Shrubs required at the present planting season, are now ready for distribution, and will be forwarded on application.

References expected from unknown correspondents.

Stapleton-road Nurseries, Bristol.

MESSRS. JEYES AND CO. have a few hundreds of Moor-park Apricots and Green-gage Plums, all dwarf trained, to offer at cheap prices; also two years Seedling Berberis aquifolium. Wanted to purchase 2000 strong Gooseberry Plants of the following sorts—Warrington Reds, Crown Bobs, and Viper; also 50 Magnolia grandiflora.

Northampton, Dec. 7.

TO NURSERYMEN.

WANTED now, or at first open weather, 1000 first rate three-year-old, hardy sorts of APPLE TREES, and 1000 PEAR TREES, suitable for planting 20 acres of sound heavy corn land. To be delivered free, at Tilbury Fort, Romford, Rayleigh, or Billericay, in Essex. Address, lowest terms, to D. MORRIN, Esq., 2, Chapel-terrace, Bayswater. N.B. larger operations are intended next autumn, as it is all up with corn and protection.

THE BELGIAN GRAND NURSERY of AD. PAPELEU, IN WETTEREN, near Gand (Belgium).—The extensive choice and immense quantities of the beautiful Vegetation of every article from this Nursery, recommends it to all persons, proprietors of estates, gardens, nurseries, and to such who have trees to plant. Amongst the Fruit-trees of this large Establishment will be found the great varieties obtained by those grand Belgian Propagators—Count d'Hardenpont, Count Coloma, Dr. Van Mons, Major Esperen al Bivort, Bouvier, Gregoire, and others. An extensive Catalogue of the trees may be had, gratis, at Mr. THOMAS'S Universal Advertising and Publishing Offices, 19 to 21, Catherine-street, Strand; or on application, will be sent, post free, on receipt of four penny stamps.

CARTER'S CATALOGUE OF SEEDS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, announces the speedy appearance of his new CATALOGUE FOR 1851, which will be forwarded, gratis and prepaid, on application by post or otherwise. He begs leave to state that the Floricultural section comprises, as usual, the Scientific and English Name of each plant, the Linnean Class and Order, and Natural Order to which it belongs; its hardiness, duration, time of flowering, and colour of the flowers, and other necessary information. The collection of Flower Seeds will comprise several splendid novelties.

H. LANE AND SON, Great Berkhamsted, Herts, will send their NEW CATALOGUE OF ROSES to applicants, by their inclosing two penny stamps. Those who are about Planting Pleasure Grounds, &c., should inspect H. L. and SON'S Nurseries (about 50 acres), as they have a fine healthy stock of some thousands of Cedrus Deodara, 2 to 4 feet; Araucaria, 2 to 3 feet; Abies Douglasii, from seed, 4 to 5 feet, with all the leading Pinus. Rhododendrons, all the hardy varieties, from white to crimson, growing in loam, from which they remove readily (also the hybrids of Sinensis—greenhouse varieties); Azaleas, best Ghent, with a general collection of Trees and Shrubs, both for the Pleasure Ground and Park; also of Fruits, Catalogues of which may be had by inclosing two penny stamps.

The Stock of Plants at these Nurseries are kept constantly removed, to ensure success, and not drawn up, to be sold at a price to deceive the public.

Double Camellias and greenhouse Azaleas 1 foot to 4 feet.

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS, all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.

For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes, Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.

Exotic Nursery, King's-road, Chelsea, London.

CHOICE FRUITS, &c.—Planters are respectfully informed that YOUELL AND CO. possess an extensive stock of strong and healthy plants of the under-mentioned:

FASTOLFF RASPBERRRY (true), as originally sent out by Youell and Co., 15*s.* per 100.
Large White do., 24*s.* per 100.
Cornwall's Victoria, 8*s.* per 100.

CURRANTS.—Improved large White Dutch, 5*s.* per dozen.
Large Black Naples, 6*s.* per dozen.
Raby Castle, or Victoria (red), 6*s.* per dozen.
Knight's Sweet Red, 6*s.* per dozen.
Knight's Large Red, 6*s.* per dozen.
Red Grape, 4*s.* per dozen.

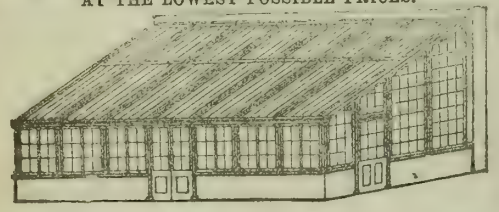
GOOSEBERRIES of the finest sorts, by name, selected for size, combined with flavour, 5*s.* per dozen.

RHUBARB.—Myatt's Linnæus, Mitchell's Royal Albert, and Myatt's Victoria, 12*s.* per dozen.
Youell's Tobolsk, fine, for forcing, 6*s.* to 9*s.* per dozen.

ASPARAGUS.—Giant, strong, 4 years old, for forcing, 5*s.* per 100.
Do. do. 2 and 3 years old, 2*s.* 6*d.* and 3*s.* 6*d.* per 100.

SEAKALE, strong, 1*s.* 6*d.* per dozen.

Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots, of the newest and most approved kinds, selected from the Garden of the London Horticultural Society, and warranted true to name, can be supplied in maiden and trained trees of the finest quality, and forward for bearing.



TO PLANTERS AND CONTRACTORS.—WHITETHORN, twice transplanted (very strong), 7*s.* 6*d.* per 1000.
Do. 1 and 2 years transplanted, 4*s.* 6*d.* and 5*s.* 6*d.* per 1000.
Do. 4 years, strong and fine, with an abundance of fibrous roots, as good as transplanted, 8*s.* per 1000, or 12*l.* 10*s.* per 100,000.
YOUELL & Co., Royal Nursery, Great Yarmouth.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

TO BE SOLD, A GREAT BARGAIN, TWO PATENT SPAN-ROOF GOTHIC HOTHOUSES, with Ornamental Ridge, Pinnacles, and Stained Glass, and ends and sides between each Gothic head. Each House containing 1167 superficial feet, 28 ft. 6 in. long, 16 ft. 6 in. wide, and upright sashes; each side 6 ft. 3 in. high. Two ends and two Gothic doors in each house. The roofs 9 ft. each way. Sashes to run down each side of the span, and the price, in the regular way, 102*l.* each, but now can be had for the low price of 70*l.* Each House complete in every respect, and only wants a wall 2 ft. high to be placed on. One, the Roof without either wood or putty. The other, the Glass put in with putty.—E. DENCH, Patent Hothouse Works, King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GREEN AND HOTHOUSES, strong built, at the following low scale of prices:—Lean-to Roofs, 12 feet by 8, 10*l.*; 16 by 8, 15*l.*; 20 by 10, 20*l.*; 20 by 12, 24*l.*; 24 by 12, 28*l.*; and 28 by 12, 32*l.* Greenhouse Garden Lights, and Window Sashes, complete, painted three times, at 9*d.* per foot. A Greenhouse, ready built, for sale, 16 feet by 9.—Plans and particulars sent by addressing a letter to Mr. SMITH, 85, White Lion-street, Islington, London.
Estimates given for Hot-Water Apparatus.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street Without.

Dixon v. *Bessell.—Alderman Wilson said,* "*It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three,*" *and fined the defendant* 60*l.*, *and* 10*l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bured Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

DRAINING TOOLS AND DIGGING FORKS.

E. H. KITCHEN, 533, Oxford-street, London, respectfully invite agriculturists to inspect their stock of DRAINING TOOLS, which will be found to comprise those suitable for every description of soil, and such as have received prizes at the principal agricultural meetings in Great Britain.

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s.* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to return them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

HETLEY AND CO. are supplying 16-oz. Sheet Glass, of British Manufacture, packed in boxes containing 100 square feet each, at the following REDUCED PRICES for cash, A reduction made on 1800 feet.

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.
GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.
Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.
PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede every other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.
GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, will be exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalized, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

SMITHFIELD CLUB PRIZE CATTLE SHOW and EXHIBITION of IMPLEMENTS, SEEDS, ROOTS, &c., commences TUESDAY Morning, and closes FRIDAY Evening, 10th, 11th, 12th, and 13th December. Bazaar, King-street, Portman-square. The arrangements this year are upon a more extended scale, and marked by the usual attention to the comfort of Visitors, thereby enabling Ladies to view this National Exhibition with facility.

SMITHFIELD CATTLE SHOW.

W. SKIRVING, WALTON NURSERY, LIVERPOOL, begs to acquaint his Friends and the Public, that he will attend at the ensuing SMITHFIELD CATTLE SHOW, to exhibit Roots of his Improved Swede, and other Turnips, and to take orders for the Seed of them, and all other approved kinds of Agricultural Seeds. W. S. will also exhibit Specimens of these three new and highly interesting hardy Trees—Araucaria imbricata, Cedrus Deodara, and Cryptomeria japonica, of which he holds an extensive Stock, of various ages and sizes, all grown from seed in the open ground, and transplanted into beds or pots in the Nursery.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1849) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.
PRICE'S PATENT CANDLE COMPANY, Belmont, Vauxhall.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

TO GENTLEMEN ENGAGED IN PLANTING.

W. HEALE, NURSERYMAN, begs to call the attention of parties engaged in Planting to his very large Stock of FOREST TREES, at 50 per cent. lower than on former years. The subjoined List is worthy of notice:—

300,000 Spruce Fir	2 to 4 feet high.	
500,000 Larch do.	1 to 4	,,
100,000 Scotch do.	2 to 5	,,
30,000 Hazel	2 to 4	,,
20,000 Birch	3 to 6	,,
300,000 Beech	2 to 8	,,
10,000 Italian Poplars	4 to 6	,,
20,000 Hornbeams	3 to 8	,,
100,000 English Oak	2 to 6	,,
20,000 Wych or Scotch Elms ...	3 to 8	,,
20,000 Green Hollies.		

W. HEALE also has a fine stock of English and Chichester Elms, Horse Chesnut, Laburnums, Alder, Weymouth Pines, Silver Firs, Pinus astriacas, Pines of different sorts, Tree Box, Evergreen Privet, Yews, Laurels, Evergreens, and Flowering Shrubs of almost every description, Roses, &c., with a general collection of Standard and Dwarf Fruit Trees. White-Thorn or Quick for boundary.—Caine, Dec. 3, 1850.

MESSRS. J. AND H. BROWN offer the following desirable plants and Choice Fruit Trees.

	s	d
Fine Dwarf and Standard Trained Peaches, Nectarines, Apricots, Plums, Pears, and Cherries. The best and most approved sorts of these respective kinds, true to name, each, 2s. 6d., or per dozen	24	0
Untrained or Maiden Ditto, 1s. 6d. each, or per dozen ...	15	0
Apples, Dwarfs and Standards of best sorts, per dozen...	15	0
Fine Gooseberries, Currants, and Raspberries, per dozen	3	0
Fine Figs, Medlars, Walnuts, and Mulberries, each ...	2	0
Strong Vines from eyes and layers, in pots, per dozen ...	15	0
Filberts, new thin shelled and red skinned, per dozen...	3	0
Andromeda floribunda, fine blooming plants, per dozen	18	0
25 Azaleas, new hardy Belgian varieties, on their own roots, with flower-buds, one of a sort, by name ...	20	0
25 American Azaleas, ditto ditto	15	0
12 choice American Plants, with buds, for forcing ...	10	0
6 Kalmias and Ledums, one of a sort, by name ...	6	0
12 Hardy Heaths, of sorts, ditto	8	0
25 Hardy American Shrubs, one of a sort by name ...	10	6
12 Rhododendrons, including scarlet, white, and rose, hardy varieties	12	0
New Hardy Yellow Rhododendrons, each, 7s. 6d. to ...	10	6
Fine Hardy Scarlet Rhododendrons, 2 feet, per doz. ...	10	0
Fine Rhododendrons, 1 foot, hardy hybrid vars., per 100	20	0
Cryptomeria japonica and 6 choice Pinus for ...	10	0
Cedar of Lebanon, 3 feet, well grown in pots, per doz....	10	0
6 Fine Hardy Magnolias, one of a sort, by name ...	10	6
Glycine sinensis, extra fine, in pots, 15 to 30 feet each...	3	6
50 Dwarf Roses, on their own roots, by name ...	16	0
12 Choice tea-scented Roses, in pots, for forcing ...	9	0
Standard and half-standard Roses, per dozen, 12s. and	15	0
Moss and Provence Roses, for forcing, per doz. ...	5	0
New Crimson Moss Rose, per dozen	6	0
Scotch Roses, one of a sort, per dozen	6	0
Pæony arbores, with buds, for forcing, per doz. ...	12	0
12 Greenhouse Azaleas, one of a sort, blooming plants	25	0
12 Choice Camellias, by name, ditto ditto ...	30	0
50 Superior Greenhouse Plants, one of a sort, by name...	45	0
24 Choice Ericas, one of a sort, by name	15	0
12 Orchidaceous Plants, choice species, and good plants	30	0
New Camellia seeds, just imported from China, 24 for	2	6
Fine New Yellow Picotees and Carnations of best show sorts, with names, per pair	2	0
Violets: Arborea, Russian, and Neapolitan, per doz.	4	0
25 Choice Hardy Herbaceous Plants, named for	7	6

Rhubarb, Seakale, and new Giant Asparagus plants supplied.

Gardeners are especially invited to send us their list of seeds required, as they will be liberally treated.

Albion Nursery, Stoke Newington, London, Dec. 7.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 7, 1850.

MEETINGS FOR THE ENSUING WEEK.

MR. RIVERS, in the last Number of our excellent contemporary the *Florist*, has successfully stripped of its rags one of the idols which the folly of collectors has set up for the admiration of simple gardeners. "Nothing in floriculture," he says most truly, "has marched so rapidly and steadily onward as an improved and common-sense taste for Roses. It is only a few years since all the gardening world used to talk of the 2000 varieties of Roses grown by the Messrs. LODDIGES; and happy was the amateur who could beat his rival by a score or two of varieties; I mean varieties in name and not in fact. In this we had, with our usual national weakness, copied our neighbours the French, who will even now say to their English visitors, 'Ah, Monsieur! have you seen my new Rose?—*la voilà!*' and then you will have pointed out to you a seedling from La Reine, with an accidental stripe on each petal; or a seedling from Madame Laffay, with smaller flowers than its parent: then takes place the following dialogue:

"*English Florist.* These are of no use, Monsieur; they are not distinct enough.

"*French Florist.* Monsieur, distinct! they are *new*.

"*E. F.* New or old, they are of no use, I tell you: have you a scarlet La Reine, or a yellow one, or a white Madame Laffay?

"*F. F.* Monsieur, *c'est impossible;* but stop! I have fine new Roses from La Reine, all superb! *Voilà* Perpetuelle, Coupe d'Hébé.

"*E. F.* Why, your seedlings are all pretty, but they are not distinct enough. But at what charge do you propose to sell these seedlings? for although of nearly the same colour as their parent, I should like one or two, if not too dear.

"*F. F.* Monsieur, *they are new*. What a horrible word is that 'distinct' of yours; I pray you do not use it. But for my seedlings I must have a high price, as I will deliver to you all the property in them; let me see, for No. 1 you must give 100*l.*; for No. 2, 125*l.*; for No. 3, 150*l.*

"*E. F.* Stop, stop, Monsieur! I will not give you one hundred shillings for your 'propriété;' they are not *distinct* enough.

"*F. F.* Monsieur, what a horrible word! it kills me."

It is satisfactory to find a man like Mr. RIVERS joining us in an attempt, which we have so long been making, to persuade the world to distinguish between selection and collection. We accept him as a stout recruit, from whom good service may be expected. His trade experience tells him much that we know nothing of; we suspect that it tells him, among other things, how unprofitable it is to swamp a nursery with things which only a few curious people ever ask for. Let us add that he has to some extent carried out his principle in the last edition of his Sale Catalogue, by cutting down the varieties with no sparing hand. For instance, he now offers for sale only 67 Hybrid Perpetual Roses; while a neighbour enumerates 110.

But why keep 67 of these varieties? Can it be said that among them there are 67 distinct peculiarities—of growth for instance, or foliage, or colour, or form, or season. And, if there be, are the distinctions always of horticultural value? Assuredly not. No one who only regards the decoration of a garden can possibly want 67 sorts of Hybrid Perpetual Roses. A dozen of the best are worth all the remainder. The object of the gardener should be to obtain the finest possible result by the simplest and most unexpensive means. Let us suppose that he has space for 60 Roses; if he plants 60, so called, different sorts, he will produce an effect about as good as that of an old-fashioned patchwork quilt. No skill can combine such materials into a harmonious whole. But suppose he takes half-a-dozen of the finest growers, the longest bloomers, and the most distinct colours; with these he may really exercise what skill he possesses in creating a brilliant scene. Mr. RIVERS himself points this out:—"Amateurs are not now content with mixed beds of Roses; all our finer sorts are planted in masses: thus, in some Rose-gardens formed this season, the beds are made to contain from 50 to 60 plants each; in olden times, these would each have had 50 varieties, forming a patchwork of colour; now they are arranged so as to form masses of distinct colours. Thus, No. 1 is Baronne Prevost; No. 2, Doctor Marx; No. 3, Madame Aimée; No. 4, Géant des Batailles, and so on; now these crimson and blush and rose-coloured large groups must have a fine effect." Certainly they must: and an effect that not only cannot be rivalled, but cannot be even imitated by any higgledy-piggledy arrangement whatsoever. Let us hope, then, that the intelligent Rose-growers will combine to carry out this principle of selection, saving themselves much trouble and loss, and their customers endless vexation and annoyance. For who is to know what to select from a legion of queer names? or how to produce a beautiful effect with materials of whose quality he cannot possibly have any knowledge?

We have often urged this point upon the consideration of the trade, and we are glad to see that the force of our arguments is beginning to be felt. In the majority of the lists this year, issued by the most considerable nursery and seedsmen, a very appreciable reduction has been made in the names of varieties offered for sale. Men are beginning to see the impropriety of mystifying their customers, and we may add, the unprofitableness of it. But nothing like enough has yet been done. Annuals, hardy plants, greenhouse plants, hothouse plants, Orchids, all the race of florists' flowers, and fruit trees of every description, are quite as much in want of the weeder as Roses and kitchen garden stuff. Of what possible advantage, for instance, to any one in Great Britain can be the 1400 sorts of Apples, or 677 of Pears, or 89 of Figs, or 182 of Grapes, or 360 of Gooseberries, enumerated in the last edition of the Horticultural Society's "Catalogue of Fruits." Why, fifty Apples, five-and-twenty Pears, half-a-dozen Figs, a dozen Grapes, and as many Gooseberries, answer every purpose—except that of curiosity. The remainder may as well be consigned to the rubbish-heap.

We know how unpalateable these truths will prove to some of our enthusiastic friends, who cling to their collections with as much tenacity as a lawyer to old statutes, or a venerable lady to still more ancient china; but we entertain no doubt that they are becoming rapidly acknowledged as truths all over the country, and that the interest of every man consists in their recognition. In former days, the object was to have something *new;* the purpose of now-a-days is to obtain something BETTER; *variety* is not the present consideration, an anxious desire for IMPROVEMENT has taken its place; and long may its place be thus occupied. Time is rapidly proving that the fancies of our predecessors must give way before the utilitarianism of this age, and that to maintain the former has become as undesirable as it is impossible.

WE some time since called the attention of our readers to a pamphlet on the subject of "Adult Schools," by a COUNTRY CURATE. We commended it, and deservedly. But at that time we spoke only of what seemed to be a good theory, yet imperfectly carried out. We are now enabled to say more, from personal observation.

Not many weeks since we were present at the opening of these schools for the winter season. There is no reason for keeping secret the fact that Salhouse and Wroxham, in Norfolk, are the parishes to which the "Country Curate" refers: nor for concealing the other fact, that while the Rev. F. C. THOMPSON, the Curate, superintends the working of the system in both parishes, he has, in the person of Mr. CHARLES UTTING, a retired gentleman, a most disinterested and efficient aid for the school in Wroxham.

How is the system working? Admirably well. The numbers are increased; and we who write these lines never saw scholars assembled with more earnest determination to do good. We ourselves examined many of them, and allowing for previous deficiencies—seeing that some had undergone penalties for criminal offences, but were now in course of reclamation—looking at a school which contained the young as well as the mature, we could not but ask the founder, Mr. THOMPSON, on what principles he had acted. His answer was very clear. One object was to be attained; it was his duty, no matter what the opposition might be, to attain it. It was this. To provide for the young and for the adults, in both parishes, instruction which would make their future lives more holy and more happy. And we found this great principle to be carefully worked out. We entered a plain school-room one evening, in company with the founder. It was the village school-room; and we saw assembled, not only the scholars of all ages, but the farmers and the squire of the parish. On examination we ascertained that when the scheme was first started, there was much difficulty felt as to the classification of the young and the old. For a time they were kept separate; but another difficulty arose out of this; and it can be easily understood of a district purely rural. The seniors had no stimulus among themselves; while the juniors, to a certain extent much quicker, not merely despised their seniors, but were not altogether orderly. The "country curate" gained his point, however. He made one school of all, old and young; and thus he obtained two advantages. By placing boys in each class of the whole school, according to their respective merits, he furnished to the seniors a stimulus which they much needed; and the juniors, mixed among their seniors, had no choice but to behave well. The consequences we have ourselves witnessed. The released prisoner sat by the schoolboy. He sat there—knowing the past, but looking hopefully on for the future. He had been ignorant—he could now learn. He had broken the law—he could now know what the law really is; and the result gained is, that you have the great end attained, though in a small sphere, that men know their privileges, their duties, and their end.

A word upon the instruction given. It would be a mistake to suppose that it is mere clerical instruction, so called. It includes, besides spelling (which many want), and reading (which many more want), and arithmetic (which many more want still), instruction on matters which men, of whatever class, need for their true domestic happiness; and that which works well in two retired country villages cannot be wrong anywhere.

There is one other matter which we have to mention. This system is entirely *self-supporting*. At first they could not go on without a paid master; that is shaken off. Even in this short time, however, with the curate at the one school, and Mr. UTTING at the other, each exchanging duties with the other when the exchange is needful, and with monitors, it is found to work remarkably well. No credit is given for the weekly payments. And those payments are made with most gratifying accuracy. We ourselves saw them made. And what can be a stronger proof that the spirit raised is real and true?

There is one feature in the case which we had

almost forgotten. There is a drawing class. And it was impossible not to be pleased with some specimens which we witnessed. It was earnestly wished by Mr. Thompson that music should have formed one branch of the instruction given. And we quite agree with him that, by its attractiveness, it would have made the hold on the people's minds complete by offering pleasure which would have destroyed, to a great extent, the charms of the public-house. In a secluded village, however, this is not so easily accomplished. For the present, therefore, that part of the scheme is in abeyance.

From this rapid sketch it will be seen not only what can be done, but what is being successfully accomplished, in a rural district, by perseverance, energy and skill. No one can deny that such work is a good work indeed—that in the same proportion that the mind and heart are well taught the man himself must become a better member of society. Is not this an end which all ought to promote? Let each influential inhabitant of a parish only say to himself, "I'll try"—and it will be done.

ON NATURAL AND ARTIFICIAL VINE BORDERS.

On many descriptions of soils, the Vine grows with great vigour, and will bear large crops of fruit, with but little or no assistance in the way of manure—such appears to be the case with the one at Cumberland-lodge (noticed by your correspondent at p. 691), the Hampton Court Vine, and others in various places. Now, as large numbers of artificial borders are failures, it is surely worth the trouble to examine the difference between such natural Vine soils, and those compounds which, when thrown together, go to form, what may be termed, a modern Vine border.

Taking the two Vines named by your correspondent as exhibiting what the Vine will do unaided on a soil suitable to its wants, it will be found that both grow on shallow rich soils, the one at Cumberland-lodge being a light sandy loam resting on the gravel and clay of the London basin, while at Hampton Court, it is a finely divided alluvial soil resting on gravel, the subsoil in both cases being dry and compact. Such being the case, it matters little what the material consists of, for a clay bottom may be equally good with a gravel one if drained naturally by fissures, or other causes. In such situations the Vine finds all the elements it requires for its growth. The fertilising particles of matter are equally distributed through the soil. There is no disposition in any portion of such soils, to run together, or to become sour; every facility is afforded the roots to permeate the earth, while the finely divided state of the various ingredients composing them (and their perfect admixture) favours the production of those minute fibrous roots (never found on strong heavy soils) which are so essential an element of success in Grape growing. Here, then, is all the Vine requires to produce good and abundant crops, and to form for itself a constitution enabling it to supply generations with its generous produce. I am not aware of any peculiarity in the loams resting on the London clay (such are, however, much the best for all descriptions of potting) except it be in the finely divided state of the parts composing them, and the presence of rich calcareous matter; but I have seen the Vines growing on similar soils in Hampshire with much freedom, and ripening out of doors fruit in good perfection. Again, on the southern slopes of the hills near Bath the Vine grows vigorously in the natural soil, though the oolite rocks on which the surface soil rests is much colder than either a gravelly or a well-drained clay one. Many of these soils are rich in potash, from being more or less mixed with portions of the fuller's-earth beds. The best natural soils for the Vine are those formed by the decomposition of volcanic rocks, such being invariably of a dry, porous quality, and are rich in inorganic matter—a sure criterion, organic matter is present as well.

Such, then, being the nature of those soils on which the Vine thrives in the greatest perfection, it would be supposed that in the formation of borders expressly for its growth, some approximation would be made towards them by making the borders for the most part, if not all, of the same constituents; or in other words, forming "a warm, light, dry, shallow soil." In place of this, however, much labour and expense have been incurred in making borders, in which the Vine refuses to thrive at all.

What I may term artificial Vine borders are generally composed of various ingredients, of which loam, dung, and some dry material, as brickbats, mortar rubbish, &c., may be considered as the principal. To these some add carrion, or other similar substances. Now we will suppose these materials to be the best of their kind, that they have been properly mixed and prepared, and that the border has been made, and the Vines planted, in the usual way. There can be no question but that (if other things are favourable), on a border of this description, the Vine will grow vigorously, and mature fine crops of Grapes. But let us wait some eight or 10 years, when the fibre of the loam is rotted, and its elasticity destroyed, by which time the dung has become a sour pasty mass; while the rain during that period will have washed down the more soluble parts, and will have partially, if not totally, stopped the natural drainage. If at the same time the loam has been somewhat of a heavy texture, the evil will be increased. In fact, it will be found, on examination, that what was, for the first few years, a rich porous border, has become, through causes perfectly natural, unsuited for the growth of the Vine. Such, I know, has been the fate of numbers of Vine borders, made at great expense, and with one great prevailing idea, that to have fine Grapes, the border must be correspondingly rich. We hear, too, of gardeners who recommend covering Vine borders every autumn with one or two feet of rotten muck. I wonder what state a border must be in, both as regards porosity and dryness, which has been subjected to this treatment for a few years, in a climate, too, like ours.

I at once admit no artificial mixture can produce a soil so fitted to drain itself, as those natural deposits on which we find the Vine thrives best. Neither can the fertilising substances of a made border be so admirably mixed. Clots of black sour humus, mixed with lumps of loam, consolidated into a compact mass, are a poor substitute for that nicely balanced arrangement of parts found on rich natural soils. Even the same soils, when removed and mixed with other ingredients, have a tendency to become sour, and never drain themselves so perfectly, as when remaining on their original bed.

I consider that when healthy and permanent Vines are wished for, more loam, and that of a sandy nature, should enter into the composition of Vine borders, and that a large portion of the following should be intimately incorporated with it, viz., charcoal dust, charred matter, wood ashes, and soot. What manure is used should be perfectly rotten, and as dry as can be procured, and that road scrapings, or (what is better) the sweepings of large towns, well rotted, and mixed with the above, will be found one of the best materials for a sound healthy border.

In preference to concreting the bottom, I would recommend the border to rest on any description of rough paving stones, raised on rough walls, 1 foot or more, according to the situation, thus forming a series of air drains under the border, the outlet to which may either be in the house, or in some place enabling you to connect them with the external air. With a bottom of this description I would then certainly concrete the surface. I use gravel, lime, and coal ashes made into mortar, and spread 2 inches thick; in addition, when the above is dry, it gets a coat of gas tar over the surface; this forms a compact substance, treading firm underfoot, and effectually throwing off rain; common 3-inch draining pipes are placed upright in the border previously, which stand 1 inch above the surface, when the concrete is laid on. When it is necessary to water the border, it can be done to any extent by pouring water down the pipes. In winter, all agree the drier the border the better; and plugs are then placed in them. It will, however, be found that less water will be required than might be expected, arising from the obstruction to free evaporation by the concrete. In a small Vinery, planted in August, 1848, the border of which was concreted after planting, I have only watered the outside border once (the inside border being only 2 feet wide), and yet the Vines have never shown the least indications of having required more, irrespective of the advantage of having in our climate the roots of the Vine under control as respects moisture. Another point gained by concreting, is the additional heat the border gains by the absorption of solar heat. I have proved frequently, that a border concreted as I have described, obtains an increase, at 12 inches deep, of from 12 to 15 degrees, and even more during hot sunshine. This increase of heat on the surface of the border will have the effect of causing that part of the border to be the dampest, as it will be the warmest; the roots accordingly will be more numerous immediately under the concrete; and precisely in that position most favourable for their healthy developement. An additional advantage of the concrete is its preventing the border becoming compact, from walking over it, and consequently its porosity is preserved. I say nothing of the disadvantage ascribed to it, from its supposed prevention of atmospheric air to the border, because I believe the thing impossible; and on the principles described above, air has access at all times underneath the border, if it is required, which I believe it is not. It certainly looks somewhat unsightly during summer, but a few pots of flowering plants set on it during summer, and a slight coat of Fern or thatch during winter, will do away with its formal appearance. I am sanguine enough to hope that it will much simplify the culture of the Vine when practised. *John Spencer, Bowood Park.*

BRITISH SONG BIRDS.

No. VIII.—As many persons will have particular tastes of their own to gratify, and prefer some birds before others, my hints as to numbers and selections are, of course, merely suggestive—not arbitrary.

It would be advisable to have not fewer than four aberdevines, four chaffinches, four twites, and four yellowhammers. One thrush will be sufficient, and he must be put in when a young nestling. After the first or second year, these birds get spiteful; and they then commit awful havoc among the small fry, despatching them with a *coup de bouche*; still, however, they sing so well, and pipe so melodiously, that one is worth the venture.

I would not recommend more than one or two choice specimens of the black cap, and two or three cole-tits, blue-tits, and marsh-tits; two garden warblers, three hedge-sparrows, one nightingale, three redstarts, three reed-sparrows, two stone-chats, two whin-chats, two titlarks, two woodlarks, two larger and two lesser whitethroats, and one pair of wagtails, grey or yellow.

With the single exception of the last-named pair of wagtails, I recommend no hen birds whatever being introduced. With animals, as with the human race, a strict sense of propriety and moral rectitude must be observed; all conventional forms must be respected; and a *Codex morum* established from which there can be "no appeal."

Of the soft-billed birds last particularised, I must observe, that a close eye should be kept on the blue tits and the hedge-sparrows. The former are habitually spiteful if they cannot get an abundant supply of their most favourite food. Under such circumstances they will, sometimes, like our friend the ox-eye, take a too close survey of their neighbour's head; break it open; and swallow its contents.

The hedge-sparrow, although an object of just suspicion, is not uniformly quarrelsome; if, therefore, you observe in them no disposition to fight, you may give them the *entreé*. They are a sprightly bird, of a good presence, and have a rich mellow song.

The water-wagtail is another ferocious bird; first cousin in disposition to a robin. Two, therefore, of the male sex can never agree under any circumstances; if associated, *one* would speedily become disposed of. Try only one pair. They are beautiful, showy birds, and will run round the margin of the fountain with untiring activity. Being, like the titlark, of the genus *motacilla*, the constant vibration of their tails, and the bend of their graceful forms, become objects for unceasing admiration. They will nearly always be in, or on the fountain, running water being their delight.

The nightingale being a bird of truly singular habits, I have suggested the propriety of admitting one only. If there were more, the chances are that none of them would sing. This bird never allows himself to be surpassed, or outdone in song. If therefore his fellow sing louder than he, and more joyously, from that moment he would become dumb, mopish, and sulky. Alone, he will perhaps "awaken the groves" with his voice. The other "warblers" I need not here comment upon. I shall have "lots" to say of them at a proper season.

By the way, it may not be irrelevant to call attention at this time to the "blue tit," already noticed. He is a most diverting little creature. My readers will find, as I did, that whenever the thrush picks out any choice morsel of food from the pan on the floor, and flies upwards with it, Master Tom will cling closely round the thrush's neck, allow himself to soar upwards with him in flight; and finally, force by "high pressure" from his mouth, the said choice morsel of food! Master Tom has an infinite variety of these tricks; and as I "owe him one," for many hours of by-gone entertainment, I now discharge my obligation.

The next question is, how, when, and where, to procure your birds for the aviary. The best seasons for the hard-billed birds, are April and September. They are then in what is termed "Flight." During these months, they congregate in vast numbers; are trapped by the bird-catchers; and sold at very low prices by the London dealers. Great St. Andrew-street, Holborn, and the neighbourhood of the Seven Dials, are the grand depositories for the feathered choir.

The soft-billed birds of passage arrive about the 10th of April, and may be purchased in the same localities. They should be procured a week or so after they are trapped, or as soon as they are what is termed "fed off;" that is, able to feed themselves in confinement on the change of food provided for them. Many are sulky when caught, refuse every temptation to eat, and die before they can be "fed off."

How to select your birds, and discriminate the males from the females, I will explain under their classified heads. We will also give early consideration to the proper food to be placed in the aviary; and show how to adapt it to the peculiar appetites of each of the inmates.

With me, latterly, a death in the family was the exception, not the rule: my birds all lived—till the rats deprived me of them—to a "green old age." I loved them while they lived—oh, how fondly! Now, *nil nisi flere et meminisse relictum est. William Kidd, New Road, Hammersmith.*

GARDENS IN THE NORTH OF ENGLAND, SCOTLAND, AND IRELAND.—No. V.

Glasnevin.—These gardens were first established in 1790, and are supported by a parliamentary grant to the Royal Dublin Society; but, as this has lately been reduced, the resources of the garden are much diminished: very lately, however, a magnificent range of curvilinear wrought-iron conservatories, at a cost of 5000*l.*, have been built—4000*l.* being defrayed by the Government, and the other 1000*l.* supplied by the Royal Dublin Society, but chiefly raised by subscription. The Professor of Botany delivers two courses of lectures annually—the first at the Royal Dublin Society's house, the second at the gardens: besides furnishing the plants for the illustration of these lectures, the Professors of Botany at the Royal College of Surgeons and at the Apothecaries' Hall are supplied, and their students are admitted to study on private days, and the Government School of Design is furnished from these gardens with plants and flowers for the instruction of the pupils.

The public are admitted to the gardens two days in the week, on which days the conservatories are open, and

parties receiving orders from members of the Royal Dublin Society, and strangers not acquainted with the rules as to admission, are allowed on any day to see these gardens. The plants were in excellent order, and were interesting both for the many specimens of fine old plants, Palms, &c., not usually met with in modern collections, and the modern and rarer plants. One house is devoted to Orchidaceous plants and Ferns, and the collection of both was interesting and good, and on the whole, I should say these, and those at the College gardens, were better grown than any I have seen on my tour; and I may mention that some of the plants are grown well elevated above the tops of the pots, and the principal material used by Mr. Moore, in which the plants are grown, is the roots of Aspidium Filix-mas, and which appears to have nearly all the merits of the light fibrous peat obtained from Messrs. Veitch, Exeter. The skill and zeal of Mr. Moore, the curator, are too well known to make it necessary to say anything in his praise; nothing could be more kind and attentive than he was during the two visits I paid.

I do not attempt to enumerate the different plants which were the most remarkable; but I may mention the two newest sent to Mr. Moore, by Major Madden; viz., the fine new white Lily (Lilium Wallichianum, already noticed in the *Chronicle*), and a Cirtopera; and particularly the magnificent Pampas Grass, first raised from seed in this garden.

There is an excellent cheap hand-book to the gardens written by Mr. Moore, and its only fault is that its contents make one wish it were twice as long. Although these fine gardens are not to be compared for extent, nor for the rarity and size of the collection, to those at Kew, yet, when one considers that they are in actual use by the different classes of students—as many as 200 are sometimes seen pursuing their studies here—and that lectures are given on the spot, one cannot but feel that they are, for scientific purposes, more useful than those at Kew, which are, in fact, little else than beautiful show-gardens. I cannot but hope that, seeing the admitted utility of this establishment, and the zeal and intelligence with which it is conducted, some regulations might be made by which an equal share of all the seeds and plants obtained for the public should be sent here; and, I may add, I am somewhat surprised that more has not been done to obtain an equal share for this establishment, seeing that Irish members are not backward in putting in the claims of Ireland in respect of such matters. The site of the garden I may mention is classic ground; the demesne was that of Tickell the poet, who planted many of the trees, and the house in the grounds was that where he enjoyed the society of Addison when he acted as private secretary to the Earl of Sunderland. Steele and Parnell were also resident in the neighbourhood of Glasnevin; and near was Delville, the residence of Dr. Delany, the friend of Swift and Stella.

I may observe that, although the Orchidaceous plants are in some respects well grown and kept in the collections I have seen, yet their general appearance cannot be compared with those of the great collections near London, such as those of Mr. Rucker, Mr. Hanbury, and Mr. Warner. As far as I can judge, there does not appear to be any systematic arrangement as to the time of growth and the period of rest, and consequently plants in these collections do not blow with such certainty, nor so profusely as those where a different treatment is adopted. My conviction is, that with respect to almost all Orchidaceous plants, as early in the spring as there is sufficiency of light, every plant should be made to grow as vigorously as plenty of heat, moisture, and air will effect, so as to ensure an early completion of the summer's growth, and a long rest or dry season.

In making these few observations, I should observe that it can hardly be expected, either in private or public general collections, that there should be so successful a treatment of this one class of plants, as may reasonably be expected, when the attention of the cultivator is confined solely to Orchidaceous plants. *Dodman.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND; OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

"When seasons change, then lay before thine eyes
His wondrous method; mark the various scenes
In Heaven; Hail, Thunder, Rainbows, Snow, and Ice,
Calmes, Tempests, Light, and darkness; by His means
Thou canst not miss his praise; each tree, herb, flower
Are shadows of His wisdom, and His power."—*H. V.*

No. VI.—Calendarial register of the management of the Vine after it has once been brought into a right form.

CULTURE OF THE MIND.

The time will vary a little with aspect, place, and season.

No rule is absolute; and it exercises intelligence and observation to adapt general rules to particular cases. What is one man's food is another man's poison.

April 1*st*.—The buds will begin to swell; if hindered in their growth by their position, ease them. In dry weather, fork up the border 2 inches in depth, and keep it clean and open.

15*th*.—The smaller buds, which often shoot near the principal one, should be rubbed off.

22*d*.—Take care that the shoots have room and freedom to grow.

May 13*th*.—Every shoot should now be fastened as soon as it gets a foot long; this must be done carefully, as the young wood when full of sap is very liable to break off, even with the slightest touch. All shoots not wanted for future bearers, and that do not show fruit, must be rubbed off; but if foliage be wanted to cover fruit, pinch off the top at the second or third joint.

20*th*.—The fruit-bearing shoots may be brought as near to each other as to form one unbroken surface of foliage. The future bearers should have as much room as possible.

The old are content with a small corner. The world is hardly wide enough for the young.

27*th*.—If the future bearers are growing too rapidly and long-jointed, keep binding them constantly in a serpentine manner; this should be done gradually, else from their strong growth there is danger of breaking them. They cannot grow too slowly or short-jointed. On these rods and buds formed on them depend your fruit of the next year. The tendrils at the footstalk of the bunches should be pinched off now. The side shoots should have their tops pinched off with the thumb nail as soon as they are about 4 inches long, and should not be allowed to grow any longer the whole season.

A hasty temper, if not checked, will quickly run into evil.

June 3*d*.—Tendrils, as soon as they are about 6 inches long, pinch off to within about half an inch of the stem. Select for future bearers the largest and most vigorous shoots, round and short jointed; train them carefully, and cut out all others. Any old and useless wood may now be cut out. Make the wounded part quite smooth and even.

All vices grow rapidly, and soon entangle us; they should, as soon as they spring up, be constantly kept in check. Soft words, and spoken in kindness, heal a broken spirit sooner than a rough tongue and harsh treatment.

10*th*.—All shoots with fruit on them, and such as are not wanted as future bearers, must be shortened to about 1 inch beyond the first joint above the last bunch, and kept to that length. Except on old trees, one bunch only should be left on each shoot.

24*th*.—Do not disturb the Vine when in blossom.

What a disappointment would it be should there be no fruit, after such careful training; look to it, and take care that thou hast something to show for similar benefits. If the mountain will not come to Mahomet, Mahomet must go to the mountain.

July 15*th*.—When the berries are set, calculate the quantity of Grapes the Vine ought to bear, and cut off the excess.

22*d*.—If the fruit be not properly shaded, either bring the fruit under the leaves, or draw a branch closer, so that its foliage may cover the fruit.

29*th*.—As soon as the berries are well set, begin to thin them, and never let them touch each other till they have nearly acquired their full size. In thinning, keep those equal in size.

August 5*th*.—If the weather be hot, supply liquid manure to the border.

Character is like the Grape bloom, which must be delicately handled; for if rude fingers tamper with it, its beauty is impaired, never to be regained.

26*th*.—Bloom will now be appearing on the berries, therefore the bunches must be handled as little as possible. The berries will now be stoning or perfecting their seeds, and during some time will not appear to make any progress.

A million seeds from one small tree do spring,
And by the hidden wind are scattered here and there;
Countless good thoughts doth God's Holy Spirit bring,
But in man's stony heart find little room their fruit to bear.
H. V.

Sept. 2*d*.—Pinch off the top of the future bearing shoots.

Reformation should not, to be effectual, be left to old age.

9*th*.—As soon as the skin of the berries begins to be transparent, no reduction in the number of berries will increase the size of the remainder; therefore, all thinning should be completed before this takes place. After this, only cut out injured and decayed berries.

Protect fruit; destroy not birds; but rather let them enjoy a moderate feast, than kill such useful auxiliaries. Usefulness should plead for some; perfection of form some; perfection of motion some; perfection of song some. You may kill all others.

30*th*.—The Grapes must now be protected from all ravagers.

Oct. 7*th*.—The fruit should kept on the tree a considerable time after it appears to be ripe. It should be cut on dry and warm days, and when the dew is off the trees.

14*th*.—If the extremities of any bunches be not ripe, cut them off.

21*st*.—Cut out carefully all decayed berries.

Nov. 4*th*.—As soon as any shoots have been stripped of their fruit, they should be pruned back to their two lowest buds. Shorten the future bearers to their short and brown wood, or to the required length. Cutting back the shoots which have borne Grapes, and shortening the future bearers, are the only operations throughout the year that require the use of the knife. *C. A., Nov.* 21*st*.

See how easily and smoothly a well-ordered life goes on! and remember what trouble and severity must be used to those who will not be bound by law or reason!

Home Correspondence.

Stove Climbers.—Having the back wall of a Pine stove, 10 feet in height, bare, I determined to cover it with stove climbers, though there was no border, and the pathway was slate, jointed with cement. I planted in March last; and in each case I had to break a small hole in the flag just sufficient to admit the ball and about a pound weight of bog, leaf-mould, and sand, for the plants to grow in. The soil under the flags was common garden mould. I first planted Stephanotis floribunda, which was turned out of a 5-inch pot, and had one shoot about 3 feet in length. This now entirely covers a piece of wall 10 feet in height and the same in width. It commenced flowering in May, and has been in bloom ever since; at one time, in July, I counted 60 heads of flowers, varying from four to seven in number, all open at one time. The plant is now going out of bloom, and of course will be pruned in. It is a pity that this is not oftener met with; for it is decidedly one of the best stove climbers we possess. Next in order comes Manettia bicolor, which, when turned out, had one small shoot, about the length of the pen I am writing with. This was apportioned a piece of wall 8 feet wide by 10 feet high, which it entirely covers; and not content with that, it has entwined itself in all directions on its neighbours. For the last six weeks it has been covered with thousands of little scarlet and yellow blossoms, and it promises to continue so for months to come. This beautiful climber bears cutting for bouquets well, and is very suitable for twining round the stem of a flower-horn. Plumbago Larpentæ alba (!?) has also grown luxuriantly with me, and is covered with bloom; but the flowers soon look shabby. When out of blossom, I am going to supplant it with Combretum purpureum. Associated with these is a scarlet Passion-flower (P. racemosa), on which there is at the present time 30 spikes of bloom, the longest of which spikes measures 4 feet in length. This plant has been in flower for these three months. I have also Euphorbia jacquiniflora, which, when turned out, was about 4 inches in height. It has now shoots 10 feet in length, and is just coming into blossom. Passiflora Bonapartea has likewise been in bloom ever since May. On an average it has opened 15 blooms every day, since that time. To these I intend to add Clerodendron infortunatum. Since March last, the above have entirely covered the back wall of a house 45 feet in length, and 10 feet in height. I have also in one compartment of the house (for it is divided into two), Pine-apples, and this season I cut bunches of Black Hamburgh Grapes from the same house, several of 3 lbs. weight, and more than two of 4 lbs. weight. They were not, however, so well coloured as I could have wished; but this I attribute to over-cropping, and too much heat. *The Gardener to W. Edwardes, Esq., Sealey Ham, Haverfordwest.*

Sikkim Himalayan Rhododendrons.—These novelties are in everybody's hands, and none have anything to guide them as to their endurance of cold. Among some 18 or 20 species, of which I have plants, I find nothing indicative of their hardihood by name, or on the labels in which the seeds were received, except as respects one, No. 4—and another, No. 8, both labelled "Rhododendron species, 14,000 feet," both of which should certainly withstand any reasonable amount of frost they can be exposed to, even in Scotland. But there are manifestly others of a very questionable character in this particular. R. lanatum with me is looking doubtful; and I am fearful of others. Indeed, of all, of which nothing has been published, R. psulla (?) and R. cinnabarinum with me look so much one and the same thing, that I doubt much whether they are different. Again, "Shrubby Alpine" looks like R. calycatum, both with me having that indescribably elegant shade of bluish pink on the underside of the foliage, which I can detect nothing at all like on any of the others. All these, and the "R. glaucum," and "Dwarf R. glaucum," should be hardy, and so should R. palla (?), if external aspect may be relied on. But, who can say? Meantime, for variety's sake, I am keeping all these in a warm pit, beside R. Dalhousiæ, R. argenteum, and R. Wallichii, already stated to be tender. We are all anxiously waiting the forthcoming work on Sikkim Rhododendrons. Meantime, any hints about the hardihood of the various sorts would be a boon of a great value to me and others, equally in the dark about watering these precious gems, and would be highly estimated. *Amicus.* [You will be wise if you treat them all as greenhouse plants.]

Birds.—I had observed for a few days during the summer a great immigration of wagtails on the lawns; in fact there seemed to be some crusade determined on, but whether the lawn was only their gathering ground or their battle-field I could not at first determine. But their lively, quick, and graceful motions afforded great pleasure to the eye. Nor was it long before I also discovered the object of their visit, for I found the lawn had become recently covered with numberless small heaps of powdered soil, such as might have been turned up by a race of diminutive moles, out of which were constantly rising millions of flying ants, with whom I have sometimes seen the air quite thickened; and I believe they are the females in their flight to institute new colonies in unoccupied lands. Now the numbers that these quick-eyed, swift-winged light troops, during their few days of active skirmishing, must have massacred of these plagues would be beyond calculation. And by so doing they were doubtless preserving that admirable balance of acting and counteracting causes which we find an infinitely wise Providence hath established; and which, in another element, Mr. Warrington has so wonderfully exemplified by the necessary co-operation of each in the required presence of an aquatic plant known as the

Valisneria spiralis, six water snails, and two gold fish, in order to keep 12 gallons of water in a state of perfect purity (see "Quarterly Review," Sept., 1850). I can also bear witness to the destruction of a great number of weeds by our winged auxiliaries; for I have noticed large troops of the golden-coated goldfinch foraging among seed beds of Groundsel and Thistles (the farmers had better, first, never allow such to grow), running up the stems, and hanging in more graceful attitudes than the most accomplished danseuse ever assumed; and utterly destroying thus, by wholesale, what would, if allowed to grow, have taken a whole army, fully equipped with spuds, to effect. I should have been ashamed to have mentioned such common-place observations, unless I constantly saw notices of the continual and wholesale slaughter still carried on against the winged denizens of the air. Now, I do not wish to advocate their entire immunity (though I have no fears on this score), from man's attack, for many were doubtless given for his food—others, when he did their work, to be kept in check; and I think it may very well be doubted whether such as are still wild, and commonly called game, if not preserved to an extravagant extent in closely populated and well cultivated districts, do not obtain their subsistence and yield sustenance from what would be otherwise lost. Certainly who (if people would but look at both sides of the question, and not at their losses only), when observing the thousands of starlings and the persecuted race of rooks making their plentiful meals in the Grass meadows on mild and damp days, would doubt their usefulness, and wish their annihilation? While the wood-pigeon, from his instinctive sagacity, escapes, who probably eats more grain in the United Kingdom than all the pheasants, partridges, and rooks together; therefore, all I wish to prove is this, that as man can, owing to his superior reason, more completely diminish or destroy the inferior animals, so ought the same reason to guide him in a proper and restricted use of that power. *C. A.*

Colouring of Grapes.—It may be interesting to know that black Grapes, on the open wall, ripen and colour perfectly, enclosed in bags made of newspaper, from the day they are thinned. Shut up thus, they must be furnished with a very limited quantity of light and air, though the plants themselves are abundantly supplied with both. *J. G. Nelson, Yarmouth.* [Does any one imagine now-a-days that the Grapes themselves require much light? Why, Nature shades them most carefully, if you will let her alone.]——Having been much interested by Mr. Kidd's remarks on this subject, I send you the plan I have adopted, as soon as my Grapes showed signs of colouring, and with unfailing success. Now, instead of sinking them at once to a low temperature, I light my fires as soon as it is daylight in the morning, and keep them up until about 12 o'clock, giving air as soon as they are fairly set agoing, and increasing it by degrees as the temperature of the house and the heat of the sun increases, until every sash and door available is thrown open. As the house cools I shut up by degrees, recollecting always to maintain a slightly moist temperature combined with a cool atmosphere at night. Both moisture and fire heat ought to be gradually decreased as the bunches advance in colour, and when almost coloured they should be dispensed with altogether. By the above simple (yet often neglected method) I have for these 12 years, without the least variation, had most beautifully coloured bold sized berries covered with a thick bloom, and no shanking whatever has occurred. Under my treatment they receive no sudden check, which I presume they would experience were they, on the first sign of colouring, submitted to a very low and dry temperature during the day as well as at night. My method secures for me two other great advantages; first, finely flavoured fruit; secoudly, well ripened wood; and I assert fearlessly that without well ripened wood it is impossible to get good coloured well-flavoured fruit. Mr. Kidd asks the reason why we seldom see badly coloured Grapes on open walls? I presume it to be this. In all descriptions of soils they get heat with light, abundance of air, and a cool slightly moist temperature at night, which is gradually decreased as the fruit ripens; and whoever follows these great points will never complain of the "crimson tinge" and of sour fruit. The idea of getting finely coloured Grapes, with good flavour, in little air, and in a high temperature, is absurd, and in opposition to the common law of Nature. *John Woodcock, Wisbech.*

Water Pipes.—Your clerical correspondent may attain his object in a much cheaper way than any of the plans suggested by "J. M. L." in your last week's Paper. A labourer well conversant with land draining work, will be all that he requires, provided the fall is first correctly ascertained. Nor will it be necessary to cement the joints of socket pipes, if the cutting be free from the roots of trees, as there is no risk of the water being "fouled" from the percolation of rain water from the surface soil, if the drain or culvert be of sufficient depth. Three years ago I brought a supply of water to some cottages of mine, by cutting a drain into a landspring in an adjoining field. The supply continues abundant, and is always pure. The water is received into a bricked well, 4 feet in diameter, and 3 feet deeper than where the pipe enters. The drainer made the well, which required 300 or 400 bricks. The cost of the drain was as under:

Cutting the drain 4 feet deep, placing a 2-inch socketed pipe, and completing the work, at per rod of 5½ yards	0s. 6d.
Sixteen 2-inch socketed pipes, at ½d. each	0 8
	1 2

Cementing the joints of the pipes is only necessary where there is danger from the roots of trees, but if it be necessary the cost will be trifling. The best article that I have seen used for this purpose is marine glue; no doubt other cements would answer. A double line of 2-inch pipes would, I think, fully supply the 500 inhabitants of your correspondent's village. The well, or the receptacle for the water would of course be contrived so as to be suited to the convenience of the parties. Deep or spring draining has been extensively practised in this part of Essex, and in many instances valuable supplies of water for all purposes have been thus obtained of the purest kind. These drains (some of them 10 and 12 feet deep), are made with tiles doubled upon each other of a size in proportion to the quantity of water requiring to be discharged, and in no instance has cement of any kind been required; but, then, the roots of trees must be carefully avoided, or they must be removed. I have seen a large drain of this kind entirely filled for several feet in one year by the roots of a neighbouring Willow tree. It may also be well to suggest that great care should be taken to use the best well burnt tiles or pipes that can be procured. "A Country Curate" may address me personally, if he should wish it, for any further information. *Henry Dixon, Dorward's Hall, Witham.*

Seedling Fruits.—About 30 years ago, I raised from seed a large number of Apples and Pears, from the most select and finest varieties; these, in the course of 12 or 15 years, all bore fruit. Many of them were crab-like and worthless, and the rest were all of mediocre quality; in short, not one was found worthy of a name. Now, had I been a colonist, in a far country, should I not have said that our best Apples only produced Crabs, and should I not have lamented their degeneracy? Hence the origin of the report from our early colonists, in America. The interesting part of the matter is, how many generations were raised from this degenerated offspring before amelioration took place, and the present excellent American Apples came into existence? *Thomas Rivers, Sawbridgeworth.*

Ipomœa Michauxii.—This new and lovely climber is now covered with its brilliant scarlet blossoms. Being of a slender habit, it is admirably adapted for flowering in small pots; it blooms at every joint, and is invaluable for bouquets. The following is the treatment it requires:—Sow seed or strike cuttings about February; when large enough, pot them off into thumb-pots, use sandy peat with loam, and drain well. Shift them gradually into 5 or 6-inch pots, in either of which let them flower. This Ipomœa requires a warm house; and as it continues to flower all the winter, it will prove very ornamental during this dreary season. *J. R.* [The plant here mentioned, is the Ipomœa macrorhiza of Michaux, now called Batatas Jalapa, and supposed to yield the Mechoacan root, an inferior sort of Jalap; but its flowers are violet and white, not scarlet..]

Achimenes picta.—Many inquiries having been made to me respecting the treatment which we give this highly ornamental plant, in order to flower it well during the winter months, I think it necessary to make the following remarks, not with a view of bringing before your readers a new mode of cultivating this plant, but merely to describe the treatment it receives here, which suits it remarkably well. About the end of July, or beginning of August, the scaly tubers are planted in pans, and placed in the stove, in order to start them into growth; when the plants have attained the height of 6 or 7 inches, they are taken out of these pans, with a portion of soil adhering to their roots, and replanted in well-drained, large pans, or shallow pots; in doing this, the stems are carefully laid down, and covered about 1½ inch deep, their tops being beat upwards, so as to allow them to be a little above the surface of the soil. Nine plants are sufficient for a pan 18 inches in diameter. From the joints of the stems which are buried, new roots are soon emitted, and this causes the plant to start into vigorous growth; water is then given freely, avoiding the application of it over the leaves. The plants are placed in as light a situation as possible in the stove, where they have a moderately moist atmosphere, and a temperature ranging from 70° to 80°, until they begin to flower, when they are removed to a somewhat lower house. The compost employed here is a mixture of rough peat and leaf-mould in equal proportions, to which a little sand is added. When the stems have done flowering, they naturally die down; the roots are then stored away in the pots in a dry situation, until the season for planting them returns. Treated in the manner above described, there were plants here last winter which produced stems 4 feet high, and bearing from 50 to 60 expanded flowers at a time on one stem, and the present year's plants promise to be equally as fine. By forcing or delaying the growth of the tubers, plants may be had in flower throughout the year, but in summer they require to be shaded. Those who are desirous of decorating their stoves with showy flowers in winter, will find this Achimenes well adapted for the purpose; its beautiful foliage and gay coloured flowers form an enlivening contrast with the surrounding plants. *Walter Hill, Royal Gardens, Kew.*

Brugmansias suitable for Conservatory Beds.—In furnishing a conservatory, many, especially amateurs, are at a loss to know the most suitable plants for the space they have to occupy, hence the strongest growing subjects may often be seen in places where they have not room to show their individual beauty, and where they have to be cut back to give their neighbours room. My object at present, however, is to recommend to the notice of the lovers of conservatory plants, the genus Brugmansia, wherever there is space for them to display their beauty, especially the B. Knightii, which, on account of its magnificent habit, its elegantly-formed pendulous double flowers, the delicious fragrance which it sheds around, and its prolific blooming, is one of the most suitable plants for conservatory culture. The specimen here was a cutting in the spring of 1847; it was planted out in July of the same year, and it has now a stem 5 ft. high, with branches 10 ft. in diameter, and the plant altogether is 12 ft. in height. It is now loaded with blossoms, which have been produced in profusion without intermission ever since the beginning of September, 1849. On this day (Nov. 4) there are 60 fully expanded flowers on the plant, and during the time it has been in bloom, they have exceeded that number. B. suaveolens planted out at the same time has grown to a much larger size, and flowers profusely, but it requires shortening of the young wood, and a period of rest. B. sanguinea, 12 ft. high, and 9 ft. in diameter, is constantly loaded with blossoms; it requires little pruning, and has flowered about 9 months out of the 12. *J. Pringle, jun., Stoke Rochford Gardens.*

Chapman's "Prince of Wales" Plum.—In your Number, dated Dec. 13th, 1845, appeared a description of this somewhat remarkable Plum, which my own experience of it, in a midland elevated district, leads me to believe is true in every particular. Your correspondents' late articles on the Plum have induced me to advocate the cultivation of this one in particular, and to bear witness to one great merit which it possesses above all others that I have cultivated, which is its never failing and abundant produce, trained pyramid fashion.

No. 1 was budded in 1844, and has been twice root-pruned.
The produce in 1847 was about 15 Plums
" in 1848 " 20 "
" in 1849 was above 144 "
" in 1850 " 312 "
No. 2 was budded in 1846, and has been once root-pruned.
The produce in 1849 was 4 Plums
" in 1850 was more than 12 "

And at present it promises to bear hundreds next year. Next to No. 2, and treated in the same manner, stands Rivers' Early Favorite. It is about the age of No. 1, and has blossomed the last three seasons, but the fruit did not set. This Plum, which one of your correspondents recommends, may prove a good Plum in the southern counties; but for produce and early fruitfulness, I have never seen any that can bear comparison with the Prince of Wales; not even "Anon's" Magnum Bonum, at Grey's Court, Henley; and as regards flavour and appearance, should any of your readers require information on these points, it may be briefly described as "an improved Orleans." I am training a Prince of Wales as a standard, which promises to yield a good crop next year, considering its size, which is but small at present. *C. B., Rutland.*

Canadian Sunflowers.—I have seen a Sunflower grown hereabouts this year, whose flower measured 4 feet 1 inch in circumference. Its stem 13 feet 4 inches, and the circumference of its stem 6 inches. I thought it huge. *H. P. P. C., Toronto, Canada.*

Medlar Marmalade.—To those who have many Medlars, and cannot consume them before they get over ripe, it may be useful to know that they stew very agreeably in the following manner, even when gone too far to be nice eating uncooked:—Throw the Medlars into a basin of hot water, and then stone and skin them, scraping the pulp away and placing it on a dish by itself till all are finished, then boil gently up the pulp with a little white sugar for 10 minutes with some cream, and dish with a wall of sweetened rice round. The following are about the proportions:—To half a pound of pulp six table-spoonfuls of sifted sugar, and nearly half a pint of cream; also one teaspoonful of Lemon juice. To anyone not minding the time the stoning and skinning a large quantity would occupy, this would be a good method of making Medlar marmalade; by longer boiling, and omitting the cream and Lemon juice. The only drawback being that they must be cooked the day they are prepared, for if left a night they get mildewed and spoilt. *M. D., Dec. 4.*

Vines.—In reference to some of my Vines still continuing to keep in green leaf, while others apparently similarly circumstanced are ripe, some account of which was given last week at p. 758, I beg to state that they all occupy the same soil, which is a light gravelly one, and the roots of all must partially run under a Thorn hedge. The sort which has so failed with me is the Black Hamburgh. They were all late before they started, although the situation is a warm one. Would it be advisable to give them some manure? they had none last year. I have a tank of liquid manure from the drains of the house, would that answer for them? *H. M., Worcester.*

Rendle's Price Current.—We have received a letter from Mr. Rendle, in answer to the remark made last week by "Sigma;" and we will beg our correspondent to look again at the Price Current, where he will find that he is mistaken in saying that it has no prices. It is true that a price is not attached to every article, but there are general prices given, which answer every useful purpose.

Leeks.—In your last Number, I observe that some of your Cambrian correspondents are somewhat at fault about the cultivation of their ancient emblem, the Leek. Allow me, who have had some experience in that way, to state a simple mode by which I have seen some very superior crops produced. In a piece of ground richly manured, and deeply dug (trenched is better), transplant the young Leeks in the following manner:—let the rows be 1 foot apart, and the plants from 5 to 6

inches asunder, in the row ; plant with a blunt-pointed dibber, having first cut off the long ends of the leaves, make holes from 6 to 8 inches deep, and merely drop in the plant, without filling in the earth ; this is all that is required, except keeping the ground clear of weeds. *Quercus.*

Yuccas.—I remark that one of your correspondents has a Yucca gloriosa, throwing up its flower stem. I beg to inform him, that if he were to sacrifice the present flower of Y. gloriosa (if gloriosa), it will not blossom next year [We doubt], neither will letting the flower stem remain spoil next year's flowering, for in neither case will it blossom next season. I have a plant of Y. gloriosa throwing up its flower stem; I have had it carefully taken up and potted in a large pot, and put in the conservatory, watering it well with weak manure water, and I find that it is growing and doing well. I expect to have it in bloom about the end of the year ; I would advise your correspondent to do the same with his plant. *A. S., Slindon, Sussex.*

Societies.

Horticultural, *Dec.* 3.—E. Brande, Esq., in the chair. H. R. Sandbach, Esq., J. Smith, Esq., F. Barchard, Esq., and Mr. Davis, of the Grantchester Nurseries, Cambridge, were elected Fellows. Messrs. Veitch sent a great novelty in the shape of Vanda cœrulescens, which proves to be one of the most handsome of Orchids, vieing in beauty even with the lovely Phalænopsis itself. Like the latter, it appears to be very profuse in the production of blossoms ; for although the plant exhibited was small, and had but one flower-spike in perfection, many more were making their appearance. Although the spike in question was more than a foot in length, bending gracefully downwards, and had upwards of a dozen large sky-blue flowers arranged thinly upon it, it was remarked that it was not near so large as some of the dried spikes of this Vanda which have been received from India. Beautiful, therefore, as the plant in its present state is, it may be expected to be yet much more handsome when it shall have had time to acquire greater size and strength. A Large Silver Medal was awarded it.—Messrs. Henderson, of Pine-apple-place, had a white Ionopsis from Jamaica, resembling Ionopsis pallida.—Mr. Blake, gr. to J. H. Schröder, Esq., produced a nice collection of Orchids containing Dendrobium sanguinolentum, Zygopetalum crinitum, Angræcum bilobum, Sophronitis grandiflora, and two charmingly flowered plants of Epidendrum Skinneri. A Knightian Medal was awarded.—From Mr. Glendinning, of the Chiswick Nursery, came a large and well cultivated specimen of Hoya imperialis, which was stated to have been in flower all the summer.—Beautiful examples of Muscat of Alexandria (quite ripe), and black Hamburgh Grapes were shown by F. G. Nash, Esq., of Bishop's Stortford, to whom a Banksian Medal was awarded.—Mr. Hibbins, gr. to the Hon. J. Norton, Esq., Anningsley-park, Chertsey, also furnished Muscat of Alexandria Grapes ; but they did not appear to be quite ripe.—Mr. Mitchell, of Kemp-town, Brighton, had a small box of Black Hamburgh, fair-sized bunches, and well coloured, the produce of a second crop from the same Vines this year. The Vines, which were started early in November, ripened off the first crop between the 14th of March and 17th of April, after which they were rested till the 22d of May, when they were pruned and put in action for the second crop, which is ripe now; and Mr. M. stated that he would take a crop from the Vines again next June. Two crops were obtained in one season from the same Vines three years ago ; but Mr. M. is of opinion that double crops should only be ripened by the same Vines once in every four years. Examples of a seedling Grape, which did not appear to be different from West's St. Peter's, was exhibited by Mr. Seymour, of Ashridge-park, Great Berkhampstead, Herts.—Two brace of Cucumbers were shown by Mr. Parr, gr. to J. Jarrett, Esq., Camerton-court, Bath.—From the Garden of the Society came the cinnamon-brown and yellow Cymbidium giganteum, Maxillaria bractescens, Lycaste plana, and Brassavola venosa, together with the Holly-leaved Hovea, the useful winter blooming Selago distans, the Brazilian Barbacenia purpurea, four varieties of Epacris, and three of Cape Heath, Manettia bicolor, Justicia speciosa, the scarlet Sericographis Ghiesbreghtiana, and the following Pears : Forelle, or Trout Pear, Napoleon, and Vicar of Winkfield—all varieties remarkable for their excellence, to which the first adds great beauty of colour.

Linnean, *Dec.* 3.—R. Brown, Esq., in the chair. J. Hutchinson, Esq., and J. Stevens, Esq., were elected fellows. A collection of dried specimens of plants, made in Ceylon by J. Frazer, Esq., was presented by R. Heward, Esq. The remainder of Mr. Clarke's paper on the position of the carpels of Exogenous plants when one or two carpels were present, was read. Dr. Adolph Schlagenweit, at the request of the President, gave some account of the researches of his brother and himself on the influence of physical conditions on the vegetation of the Alps. In their researches they had separated the Northern, Middle, and Southern Alps. The plants requiring mild temperatures were found higher up the Southern than the Northern Alps, whilst the plants of cold latitudes were found higher up the Northern than the Southern Alps. The result of their researches had been published in a volume entitled "Untersuchungen über die Physikalische Geographie der Alpen," which they presented to the Society.

Entomological, *Dec.* 2.—G. R. Waterhouse, Esq., President, in the Chair. The President stated that a new Part of the Society's Transactions (N.S., Vol. I., Part 3) was ready for distribution ; also that the number of subscribers to the proposed "Entomologia Britannica," was sufficiently advanced to warrant the commencement of its publication early next season ; a few additional subscribers were, however, still required. Specimens of the new Cheimatobia boreata were exhibited by Mr. Cooke, from Warrington. Mr. Evans exhibited a species of Lampyris which abounds in Brazil, emitting a bright light on the wing in the month of November ; also a living specimen of the luminous British Geophilus electricus. He also read an extract from an Australian newspaper, giving an account of the first meeting of a Society for the cultivation of the natural sciences, at which a notice was read of the attacks of a species of grub upon the Vines of that country. Mr. S. Stevens exhibited specimens of both sexes of a beautiful small variety of Papilio Priamus, collected on the banks of Richmond River, New South Wales, by Mr. Leicester ; also of a curious moth from the Amazons, described by Mr. Newman in the last part of the "Zoologist" as new, under the name of Myrmecopsis Eumenides [but which had previously been described and figured by Hubner under the name of Pseudosphex Polistes]. Mr. Stainton exhibited five new British species of Tineidæ, several of them belonging to the genus Coleoptera. He also gave an account of the discovery of the larvæ of Goniodoma auroguttella by Mr. Mann, which inhabit cases exactly like the seeds of Atriplex, upon which plant it feeds, and stated that Mr. Jordan had found some larvæ feeding upon the flower-buds of Origanum vulgare, of which also they constructed moveable cases in which they reside. A note from Mr. Wilson was read, giving an account of a peculiarity in the atmosphere of the United States, which has the effect of destroying collections in a few years. This is caused by a white hoary deposit upon everything shut up in cases, which takes place in one or two days during the hottest parts of the summer, and by which Say's collections have been destroyed. It is also necessary for the cases in which preserved birds are confined to have holes for ventilation made in the top. The President also stated that, owing to the state of the climate, the collections of insects formed by the Asiatic Society at Calcutta had been destroyed. Mr. Westwood gave an account of M. Guerin's researches upon the insects which attack tobacco and cigars, when several of the members present dissented from his assertion that the country from which any particular case of cigars had arrived might be determined by the insects which are found to have attacked it, as it was liable to have been infested in the general stores of tobacco in Europe. Mr. W. W. Saunders read an extract from a letter received from Mr. Harrington, giving an account of various insects captured on board ship at great distances from land ; and Mr. F. Bond mentioned the fact of having recently noticed that a specimen of Sphinx Atropos in the pupa state had emitted the curious squeaking sound for which the species is so remarkable.

Garden Memoranda.

Hatfield House.—There is much in the aspect of this old garden, mentioned last week, to arrest the attention of the careless, and to delight the critical; we are not aware of the existence of a more perfect and pleasing example of the ancient style of landscape gardening, and it is satisfactory to reflect that as the vineyard has for ages past charmed our forefathers, so it may continue to delight generations to come ; there is nothing to invite a contrary supposition. Its walls of Yews are green and vigorous. The present noble proprietor of Hatfield House, with a just appreciation of the merits of the place, directed, a few years since, with admirable feeling, various restorations which neglect, rather than the inroads of time, had rendered necessary. The bowered walks and other embellishments are evidences of the judicious taste of the noble Marquis. To prove our assertion that "the vineyard has in its time charmed our forefathers," we may quote a passage from the learned Fuller's "Book of British Worthies," a work written 200 years ago, in which, after describing Hatfield House and the choice delights thereunto belonging, our author quaintly says, "Within a little mile thereof (Hatfield) lyeth a place called the vineyard, where Nature by the midwifery of Art is delivered of much pleasure ; so that the reader must be a seer before he can understand the perfection thereof; had this place been in Græcia or nigh Rome, where the luxuriant fancies of the poets, being subject bound, improve a tree into a grove, a grove into a forest, a brook into a river, and a pond into a lake ; I say, had this vineyard been there, it had disinherited Sempe of its honours, and hence the poets would have dated all their delights as from a little Paradise, and Staple-place of earthly pleasure."

The kitchen-garden is situated on the opposite side of the river—it anciently formed part of the "vineyard;" the bank fronting the river is occupied with a row of tall Lime and Chestnut trees. An arched opening is formed in the centre of the line corresponding with that existing on the opposite hill; the vista is thus continued through the garden, and terminates in a small tower. The walls of the kitchen-garden include about 4 acres ; there are two more under cultivation without the walls.

It has become one of the essential aims of gardening skill to prolong the periods of production of both fruits and vegetables. The attainment of double bearing fruits is a great step towards that object. This is appreciated here ; we find due attention given to that excellent autumn bearing variety of the Raspberry, of which a large quantity exists covered with fruit ; ample supplies of Currants are also secured at this same season. In a few years, may we not hope to have Strawberries in similar abundance at a late period of the year ? By securing proper varieties of Peaches, Apricots, Cherries, and Plums, the supplies from each may be continued for as many months as they were in weeks formerly. One recent example may be offered ; we may hope to enjoy that delicious fruit, the Green-gage, a month later by the cultivation of the recently introduced variety called "Reine Claude de Bavay ;" its cultivation is here pursued for that purpose. Amongst vegetables, with a little management, a great deal in the furtherance of the same object may be done. A prolongation of the supply of globe Artichokes is obtained in this garden by potting small plants in the autumn and planting out in May. The plants thus treated develope their flower heads later in the season. Peas are obtained up to November. The Green Marrow is found valuable for late crops. Horn Carrots are also successively sown ; the later crops standing in the ground through the winter furnish a valuable supply in the spring, and obviate the necessity of their early culture in pits. There exists no hot-water conveniences for forcing vegetables, but a very economical and efficient forcing-pit is employed, fermenting leaves producing the necessary excitement ; a pit 30 feet in length, 15 in width, and 4 in depth, has been sunk outside the garden, in a convenient position to receive the leaves direct from the carts. This is annually filled, a rough frame is placed over the mass, supported by slight piers to prevent its irregular subsidence with the leaves ; an early crop of Asparagus and Rhubarb is first obtained ; Potatoes succeed, and an invariable heavy crop is secured entirely without disease ; Melons or Cucumbers follow, the genial bottom-heat still supplied by the leaves materially assisting the progress of the last occupants of the bed. In November the pit is cleared, and affords a valuable supply of leaf-mould. In retracing our steps towards the Vineyard, on the hill-side we gain an excellent general view of the garden from the river's brink ; it is even more picturesque from this position than from the summit of the hill. The old author is perfectly right in saying that "the reader must be a seer before he can understand the perfection thereof." Our description most imperfectly conveys it.

Miscellaneous.

Winter Decoration of the Flower Garden.—Lest the occurrence of a number of empty beds on a lawn or in a flower garden, where the system of massing summer plants is adopted, should impart to a place a bare and desolate aspect during winter, a store of the lower kinds of evergreens should be kept in pots, and plunged in some part of the kitchen-garden, or in any reserved corner through the summer, to be transferred to the flower-beds directly their gayer furniture has been cleared away in autumn. Such a plan is less troublesome than it appears to be ; for if the plants be kept constantly in pots, summer and winter, and merely be plunged in the ground, a simple re-potting once a year, with an occasional watering in only the very driest summer-weather, will be all the attention they want for three or four years, when they will require renewing by propagation. The fittest kinds for the office will be several dwarf Heaths, particularly the Erica carnea, Cotoneaster microphylla, Berberis aquifolium, Menziesia polifolia, Andromeda floribunda, Pernettya mucronata, Arctostaphylos uva-ursi, Gaultheria Shallon, Ledum buxifolium, Rhododendrons ferrugineum and hirsutum, the common trailing Savin, and the varieties of the Minor Periwinkle. By a judicious choice and variation of these, putting one sort only to a bed, some amount of verdure and liveliness will be produced during winter, at a cost of labour and materials which are entirely insignificant in comparison with the effect realised. The intermixture of a few beds of variegated Ivy, or variegated Periwinkle or Savin, or even the variegated Hollies (especially the prickly), variegated Yew, and Aucuba, kept dwarf, would increase the variety. The plants should be potted in rather a poor soil, lest they grow too luxuriant, and send their roots too far beyond the pots. *Kemp, on Small Gardens.*

Distinction of Species among Plants.—"The Authors" (of Hooker and Arnott's British Flora), "are not inclined to believe that any one of the tests,"—that is, of difference of habit, however indefinable, or of microscopic difference accompanying identity of habit, or of permanence under cultivation,—"is sufficient :" they think that "a thousand years' cultivation cannot prove two supposed species distinct ;" that "there appears to be less violence done to nature's laws by combining too much, than by subdivision, unless where there is an anatomical or physiological distinction." Linnæus is asserted to have taken "nearly all his specific characters from conspicuous parts, especially from the stem and foliage," which are said to be "therefore natural :" and prophetic hints are given of a time "when what are now called genera or subgenera will alone be considered species :" finally, the

authors refuse to partake in the so-called "neomania" for splitting, due to "the too-refined ingenuity of the German, Swiss, and modern Swedish botanists." In these and the accompanying remarks, there appears to be a confusion between the actual distinctness of species in nature, and the outward differences by which we apprehend that distinctness: it is most true that a species "can neither for convenience be united with others, nor be split into several:" we should certainly seek, not convenience, but the very truth: but how are we to arrive at the truth? When we speak of one plant as distinct from another, we mean that it is distinct as a whole, not as a mere collection of distinct parts: the characters do not constitute the difference; they do but manifest it to our sight. No test can therefore be *à priori* declared sufficient: all may sometimes fail, and yet the plants may be really distinct. Science in such cases is not, as it might seem, impossible; for frequent observations under different circumstances by laborious and sagacious observers, aided by cultivation, will doubtless finally ascertain the truth. Of course many mistakes will be made; but we know of no other method which can really secure science from the rashness or vanity of species-mongers, and at the same time ensure its sound and permanent progress. "At the beginning of our studies," says Fries, "we are always hoping to circumscribe nature with absolute characters and limits, as if our hands held her in their grasp; but when we gain experience, we come to see the emptiness of our hopes and the futility of our efforts. For nature lives in integrity: and when we cannot take her in under this her true character, we tear her in pieces to adapt her to our own perceptions, and then patch her up again in any way we can." *Annals and Magazine of Natural History.*

Hints on the Cultivation of the Hollyhock, by William Chater.—In presenting these few brief remarks upon the cultivation of the Hollyhock, I beg to say, that another year's experience induces me to enforce the same routine as the previous one, feeling confident, after 25 years cultivating this ornamental plant, that purchasers following these directions may ensure success. The Hollyhock will grow best in good old garden soil, well trenched over to the depth of two feet, with plenty of thoroughly decomposed manure; such as old Cucumber beds, or night soil mixed with earth. Sandy loam they like, and if the subsoil is wet they will thrive remarkably well in the summer, but in the winter wet is very injurious to them; to prevent which, I remove, to the depth of one or two inches, the mould round the neck of the plant, and fill up with white sand, about 6 inches round the stem, level with the surface: it is simply to preserve them from wet, insects, and slugs, from which, in the winter, they are apt to suffer very much, if not killed. They may be propagated by single eyes in July and August, also by cuttings in the spring, placed on a slight bottom heat. Young plants raised from summer cuttings are best preserved by repotting them in October into large pots—the larger the better, in light rich sandy earth, and placed in a cold frame; thus they will grow during the winter. In March or April turn them out into the open ground and they will bloom as fine and as early as if planted in the autumn. Plant them not less than 4 feet from row to row, and 3 feet apart in the row. If grouped in beds, not nearer than 3 feet each way. They will grow well in the shade of distant trees, but by no means must the roots interfere. In May, when the spikes are grown about a foot high, thin them out according to the strength of the plant: if well established and very strong, leave four spikes: if weak, two or three, or only one, at the same time placing a stake to each one separately. The most robust grower does not require a stake higher than 3 feet from the ground. Stake them before they get too high, and secure them well by tying, and they will grow erect. If the weather is dry at this season of the year, they must be watered with a solution of guano, or any other liquid manure, poured carefully round the roots, avoiding pouring it on or too near the stems. To grow the flowers fine, cut off the lateral shoots, thin the flower buds, if crowded together, and take out the top of the spike, according to the height desired, paying attention to the usual height and habit of the plant. Observe, by topping it you may increase the size of the flower, but at the same time shorten its duration of flowering, and perhaps disfigure its appearance. *Nurseries, Saffron Walden, Essex, Sept.* 1850.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

As the season is approaching when every proprietor looks to home for enjoyment, let the gardener make it his particular business to contribute, as far as lies in his power, to the gratification and pleasure of his employers and their friends. The plant houses and their occupants will be of the first importance at this dull season; and, to be appreciated, they should be arranged in such a manner as to display themselves to the best advantage. Great care should be taken of plants now in flower, in order to preserve them in that state as long as possible; due attention should also be paid to bringing others forward, that a proper succession may be kept up. Let perfect order and neatness be evident in everything; for, if this point be attended to, it will compensate in a great measure for the absence of a more extensive floral display.

FORCING DEPARTMENT.

Pineries.—Care should be taken during the next few weeks to limit the application of exciting influences, or the plants will be induced to grow at a rate very disproportionate to the amount of light which they are at liberty to enjoy. The object to be aimed at in Pine growing is not the producing of a large plant with gross exuberant foliage, but rather the production of small yet healthy plants, with short sturdy leaves, while the roots are revelling in the rich compost. This end is not to be attained through starving the plants by an inadequate supply of water and soil, but by affording, along with a proportionate quantity of these requisites, a free circulation of air at all times. If this point, in connexion with a proper supply of water, be duly attended to, and if a healthy root action be secured, the plants, though small, will be filled with highly elaborated sap, and, as a natural consequence, will produce large well-swelled and highly-flavoured fruit. Vineries.—Let forcing be carried on with great caution at this dull season of the year; but take advantage of every fine day to allow the temperature to rise 15° or 20° higher than that which it is kept during the night. Where the buds are not yet broken, the rods may be syringed three times a day in fine clear weather, with water of which the temperature is about 70°; and, after the buds break, it should be used 10° to 15° warmer. Admit air on every favourable opportunity; and proportion the amount of moisture in the atmosphere to the strength of daylight. Be careful that the fermenting material over the roots does not get too hot—a moderate warmth, not exceeding 75° or 80° in the dung, is sufficient; but, at the same time, it should be frequently examined, that it does not fall too low during cold weather, or the check will injure the roots. Where the Grapes are still hanging, remove the faded leaves, which are no longer of any service to the Vines, and prune in at once all spurs on which no fruit is hanging.

FLOWER GARDEN AND SHRUBBERIES.

In this department also, let perfect neatness prevail, to compensate for the absence of more brilliant attractions. Let all the fallen leaves be carefully removed, and the surface of the soil in the borders and clumps forked over, or made clean with the rake. The walks should be put into perfect order, and receive a slight sprinkling of clean fine gravel where necessary. Let the drains and grids be examined and cleaned; and if in very rainy weather the water lies on any parts of the walks, let the defect be remedied by introducing a new drain, or by filling up the low places with new gravel; nothing interferes so much with the enjoyableness of any place, at this season, as damp dirty walks. If the turf is wet in any part of the pleasure-ground, this is an excellent time for remedying the defect, by cutting drains wherever they are required. In doing this, keep the drains at the greatest possible distance from trees, to prevent them being choked up by the roots; but in parts where the proximity of trees is unavoidable, let the drains be filled with broken rubble to within 12 or 15 inches of the surface, that a passage may be secured for the water, even if the roots do enter the drains. In filling the drains up with soil, let it be well rammed in, to prevent any after sinking of the surface.

FLORISTS' FLOWERS.

Every exertion should now be made for the coming year; composts of all descriptions should be made, for in this lays the great secret of success. Watering, ties, shading, care of every kind is comparatively useless, if the food (soil) of the plants is not carefully adapted to their necessities; therefore, turf sods, willow dust for Auriculas, cow manure for Ranunculuses, or stable manure for Carnations and Picotees, should be looked out for, and should all be of the best description, and, if possible, kept under cover; a very successful exhibitor of florists' flowers (a friend of ours) keeps the whole of his composts the year round under an open shed; as a matter of course, few have this convenience, still, when it can be done, the flowers, let them be of what kind they may, are all the better for the extra trouble in this particular. Dahlia roots should now be carefully examined, incipient mouldiness is thus often detected, and the root preserved. They may now be stored away in a moderate dry place. Moisture for Auriculas and Polyanthus is just now superfluous; damp is to be avoided; fresh air, and abundance of it, is highly desirable.

KITCHEN GARDEN.

To prevent any difficulty in digging up Celery or Cardoons, when the ground is frozen very hard, let a portion of each, about as much as will suffice for a couple of weeks, be always under protection, either by means of loose litter, Fern, or thatched hurdles, or some other convenient material which will exclude frost. These coverings should be put on while the ground is in an uncongealed state, as it would do harm rather than good, if put on while the ground is hard, by preventing the sun and air acting upon it in case of a change of weather. It must, however, be understood that the portion which is covered up is not to be left untouched till the arrival of frosty weather, but used in the regular rotation; and as the covering is taken off the part for present use, it is to be moved forward to a similar space beyond, so that a supply for the next ensuing fortnight shall always be under protection, excepting of course when the ground beyond is in a frozen state. If, by means of spare frames or other contrivance, a portion of such crops as Parsley, Spinach, Sorrel, &c., can be protected, they will be found very convenient, when the ground is covered with snow. Some Horse-radish, Jerusalem Artichokes, Parsnips, &c., should be got up and laid in moist soil for present use. It is a practice with many on the approach of severe weather, to take up a quantity of Celery and Cardoons, and remove them in-doors; but we never take up more than two or three days' supply, as we have invariably observed great waste to result from the opposite practice, besides which, the quality of the vegetable is deteriorated, being rendered tough and stringy, instead of being fresh and crisp.

State of the Weather near London, for the week ending Dec. 5, 1850, as observed at the Horticultural Garden, Chiswick.

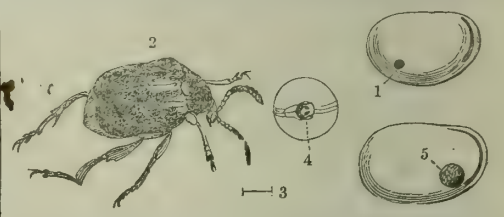
Notices to Correspondents.

Bird Stuffing: *Artist.* Arseniacal soap is a good compositio to apply to the skin of a bird, in order to preserve it, preparatory to stuffing.‡

Books: *Ignoramus.* Macintosh's "Flower Garden" will possibly answer your purpose.‡—*S H G.* Lyons's book on Orchids.—*A Z.* Macintosh's "Greenhouse, Hothouse, and Stove."‡



Crowea: *W E.* It will not flower well with you at this season, unless you give it a little heat. If you have an intermediate house, that would suit it perfectly.‡

Grafting: *A Z.* Junipers and Cypresses may be grafted on the Red Cedar. Use herbaceous or summer grafting. Rhododendrons should be "worked" in autumn (or it may be done in spring), and if you can place them in a slight bottom heat afterwards, so much the better.‡

Greenhouses: *W V C.* The frost must be kept out of your greenhouse, but whether this is to be effected by canvas curtains or by fire heat will depend on its severity. The less fire heat employed, however, the better; all you have to do is just to keep the temperature above freezing.‡

Greenhouse Plants: *O.* They should be watered *very* sparingly at this season; no more in fact than is required to keep the plants *damp.* Wetness, especially in cold weather, is avoided by all good gardeners. The object is to keep plants of that kind as dry in winter as is consistent with health.

Insects: *A H and Son.* The little beetles in the interior of the dry Beans are a species of weevil (Bruchus granarius), which lays its eggs in the Bean whilst the seeds are quite soft. In our woodcut 1 and 5 are holes in Beans; 4, portion of insect in a Pea; 2, beetle magnified; 3, natural length of ditto. The

wound in the Bean is quickly healed over, and the grub, when hatched, feeds in safety beneath the hard skin on the softer interior, not, however, without being subject to the destructive attacks of a parasitic ichneumon, as we found the cocoon of a small species of that tribe in one of the Beans. *W.*

Mosses: *Muga.* Hooker's Muscologia Britannica, or the 5th volume of "Smith's English Flora," will be your best English guides. "Gardiner's Lessons in British Mosses" (a very nice book), will also be useful to you.

Names of Plants: *Erzeroum.* 99, apparently Geum rivale.—*Ch M—l.* We do not see in what your plant differs from Epidendrum Hanburii. E. Martianum is a totally different species, with yellow flowers.

Nymphæa: *A H.* We will write to the author of the statement. It is so dark that we cannot judge of the leaves; but we think we recognise them, and will notice them again next week.

Sash bars: *N B.* An account of Mr. Paxton's machine for making sash bars may be found in our volume for 1841, page 216.‡

Seeds: *H Y A.* You must excuse our entering into such a detail as to tell a seedsman what seeds to sell. A tradesman is to be presumed to understand his trade, if not he should learn it. Besides, by consulting this and previous volumes, you will find all the information you seek.

Sikkim Rhododendra: *Amicus.* We are unable to give you any information on the subject beyond what is to be found in the advertisements.‡

Strawberry Tiles: *C A.* The idea of these was taken from a letter in our columns some years ago, and ruined by the ignorance of the maker or vendor. Our opinion of them is well known; it is that of all gardeners of common sense, and we can admit no further discussion upon their application. We will, however, add, that the material from which they are prepared is sometimes good, and that they are very useful for mending roads.

Transplanting: *American.* The best time for doing this is in September; but it may also be done in spring. The common and crimson China Roses are easily obtained and make excellent beds.‡

Victoria regia: *P E.* Mr. Gray having in part recalled the misrepresentations he made on this subject, we defer for the present the comments which they must some day receive at our hands. The name originally given to the plant by her Majesty's command is not to be lightly treated, even by those who are competent to determine disputed points of science.

Vine Walls: *Merseman.* Your plan of protection is actually in use so far as its main features are concerned; and it answers perfectly. Any coarse canvas of loose texture will do; the more open the better. A kind of thin canvas, employed by copper-plate printers to clean their plates, is good and cheap.

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

FURZE MACHINE.
COTTAM AND HALLEN have now brought to perfection FIRCHILD'S PATENT FURZE CUTTER AND BRUISER, for the preparing of Furze for Feeding Horses and Cattle. The Machine may be worked by horse-power, and will cut and bruise at the rate of 20 bushels per hour with one horse, a man, and boy; with two horses, 40 bushels per hour; if a steam-engine, in proportion to the power applied. The Machine is now on view at COTTAM and HALLEN'S, No. 2, Winsley-street, Oxford-street, where every other description of Agricultural Machinery may be seen.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.
At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.
*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.
☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.
The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.
NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.
Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.
"Do you bruise the Oats you give your horses?" "No."
"Then you lose one bushel out of every three, and your cattle do not half so well."
MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.
118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

The Agricultural Gazette.
SATURDAY, DECEMBER 7, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 11—Agricultural Society of England.
THURSDAY, — 12—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 18—Agricultural Society of England.
THURSDAY, — 19—Agricultural Imp. Society of Ireland.

"HIGH FARMING" is farming *up to the mark*—up to that mark on the scale of expenditure at which the returns are largest in proportion to the outlay: and we call it *high* farming because we believe that, as generally conducted, agriculture at present is not nearly up to this mark. Of course it is quite possible to go beyond the mark—and excessive outlay has often enough before now met with insufficient returns.

Now, though this is a definition which silences all discussion about its object, simply by permitting every one to attach his own meaning to its words, yet the practice advocated may be well enunciated in these general terms, both because its details must in fact vary with the circumstances of localities, and because it would be a good thing if we could disarm the opposition of many, who seem to think themselves attacked by the advocates of high farming, whereas they are in reality the models whom these writers would hold up for imitation. Mr. HONEYMAN, for instance, in his able lecture before the Trafalgar Society, reported in another column, has a hit at those whom he calls "high farming humbugs," without thinking that his own energetic and intelligent practice is itself far beyond the limit that thousands in this country consider to be the utmost which the sober-minded "practical" rent-paying farmer can find it his interest to attempt. And our correspondent on this subject, at page 730, though he swells the cry of experienced men against the extravagant doctrines of "mere theorists," is well known beyond his own county as an agriculturist exhibiting all the energy and intelligence which any of these theorists ever desired to spread. It is not by any such particular, as the letter of Mr. BIGGS communicates, that the policy of "high farming" will ever be determined; all that these words can mean is energetic, able, and intelligent agricultural practice. It will exhibit itself in a dozen different ways in a dozen different places—all that it needs is the condition of mind which all men admire, and the condition of means which all men desire, the one to see and to will the utmost which circumstances permit, and the other to enable its attainment. High farming on the Lammermuirs and in the Lowlands, on the wold and in the vale, in the country and near the town, differs as much as any six things can, but it is one and the same as regards the character of the men by whom it has been developed. In every case a man having the mind to *perceive* the advantages of his circumstances, and the means to *take* advantage of his circumstances, has exhibited the energy and the resolution to develope these advantages to their utmost. And as such men are still a minority in the agricultural world, and their practice still far above the average cultivation of this country, so we are at liberty to call attention whether to the parts of which it consists, or to the spirit which animates the whole, under the words—HIGH FARMING.

A very rich highly manured soil, it appears, from the letter at page 730, is unfavourable, according to our climate, for the growth of Wheat: and we know that well enough—the difference between a wet and a dry July in our own case amounting to at least 1000 bushels of Wheat—but is high farming to be condemned on that account? We have yet to learn that such a condition of soil is not a most valuable property to any one who owns it. There is a way of turning it into gold, if not by means of Wheat, then by some other plant. Flax and Hemp, Mustard, Chicory, and many other crops hitherto little cultivated, might be tried: and the farmer, because the Wheat crop fails to remunerate him as it hitherto has done, either by excess of organic matter in the soil, or by excess of importation from other countries, ought not on that account to consider either that agriculture must be ruined, or that high farming is absurd; other means of turning a rich soil to account exist; if grain growing does not pay, meat making may.

It is difficult to write in any hopeful manner of the means within his own reach which the farmer has of bettering his circumstances, and yet avoid the suspicion of aiming at the maintenance of rents: and yet it is curious that the political means of bettering their position, in which so many yet have faith, rarely fall under a similar suspicion, to which, by rights, they are nevertheless most certainly quite as obnoxious. Rents, no doubt, must fall, on any injury done to agriculture, just as they must rise in proportion to any benefit it receives—leaving, in both the cases, just that profit on the business, for which the majority are content to labour: and they must do so, not as a necessary and natural consequence for which we may patiently and quietly look, but as a result of the outcry and complaint, in which we readily join, that are to *exact* the reduction. Landlords are not to be expected to come forward and for benevolence sake remit their overcharges to a grateful tenantry; they are to find their land less valuable in the market before their rents will fall; and just as greater competition, with every boon to farmers generally, will raise the price of land, so the diminished competition with every loss must lower rents. Those landowners certainly are wisest who foresee results of this description, and readily accommodate their demands upon a tenantry to altered markets, so as to avoid that loss of capital invested in cultivation on which their own rentals as well as farmers' livelihoods depend.

These are the two means which united will carry us through the difficulties that now surround us—energy and intelligence in tenantry to take them out of the established practice adapted to 7*s.* or 8*s.* a bushel for Wheat, and 6*d.* to 8*d.* per lb. for meat, and try in other crops or other ways for profit—and far-sighted fairness in our landlords to yield to present circumstances the reduction which, if neglected now, hereafter may be forced from them in a doubled amount by the necessities, of which their own narrow selfishness will have been in great measure the cause.

RURAL ECONOMY.

THERE is fortunately at present a spirit of inquiry into the details of farming and management of landed property, which cannot fail to lead to useful results, and among others, that regular farming cannot succeed, any more than any other business, without both skill and capital. It is worthy of investigation, however, whether the occupation of a small portion of land may not be made the means of economical management of an establishment, as well as of affording useful occupation to the owner, and enable him to do good to those about him. When we look to the many items which make up the whole of any one meal of a family, not one of the labouring class, it must be very doubtful if a few acres of land, even under good management, can be made to supply the requisites in this climate and state of society; on the other hand, we must not condemn farming a portion of land, because, under no proper control, proprietors declare that it is a ruinous business, for if managed with intelligence and care, a portion of land will be found to be a most useful adjunct to any family. We propose taking the instance of a person of moderate fortune in the upper class of society, having a house and garden in the country, and keeping a carriage and pair of horses, purchasing fodder, butter, and milk, and such vegetables as the garden does not afford. The following may be set down as the items which he has to pay:

Wages of gardener and coachman, with the tax	£72	0	0
Help in garden, &c.	25	0	0
Keep of 2 horses, with smith and tax ...	52	0	0
Butter and milk	30	0	0
Poultry, eggs, and pork	30	0	0
Carting coals, and hired horse-work ...	5	0	0
Potatoes to buy	5	0	0
	£219	0	0

Taking this as the sum which he has to pay for the things stated, the inquiry is, the cost at which he can procure them by farming. It is necessary to state here, that these notes are only applicable to those who are inclined to study the useful more than the ornamental, who can dispense with a good deal of that expensive article—style; not but that the system proposed would be marked by a great degree of tidiness and order. The establishment will have to be remodelled under the master; the gardener should be headman; the coachman is to work the horses on the farm, as well as all carting work that is required; a boy may be found necessary, and all extra work done at contract prices as far as possible by the people of the place. A little experience will enable the master to say what is a fair rate for the work to be done, and he will establish such an understanding with his labourers, that his statement will generally be taken as the proper rate. The golden rule of kindness, by giving a personal interest to the work, will get much more done than orders; and before long, it is not *the* crops, *the* cows, but *our* crops, *our* cows, and the interest taken by the man, appears even greater than that of the master; and by considerate treatment we find that such men are by no means rare. The establishment would be the gardener and coachman, a boy to help wherever required, a labourer who would attend the cows and do other work; a woman for the dairy seems more proper than a man, and if the family washing is done at home, she would also be laundry-maid, and feed the poultry. The different capacities of each would soon lead to the exact

duties; but for the out-of-doors people it should be understood that they are all to turn to whatever is required, whether garden, farm, or grounds. The expenses under this system may be stated as follows:—

	£	s.	d.
Gardener and coachman, wages and tax	72	0	0
Boy and labourer	20	0	0
Extra labour	25	0	0
Smith and tax on horses	11	0	0
Rent and taxes of 20 acres	30	0	0
Interest on capital (implements and stock) ...	8	0	0
	£166	0	0

The result is in favour of farming; but it will be observed that 20 acres is the quantity of land taken to supply the articles enumerated in the first table, and we have now to enter upon some detail as to the produce required and management of the land. There is required fodder for horses, cows, pigs, and poultry, sufficient of each to supply an average family of the kind supposed. There would be 2 horses, 3 cows, to supply butter and milk; 2 or 3 pigs, 20 or 30 hens. The following statement will show the quantities of produce required, and the number of acres of an average quality to grow it:—

	Acres.
200 Bushels of Oats, at 40 bushels per acre	5
40 ,, of Barley for pigs and poultry	1
700 Stones of hay, at 150 stones per acre	4
250 ,, of meadow hay ,, ...	2
5 Tons of straw, with Oats	0
Grass for grazing cows	6
12 Tons of Turnip, Mangold, and soiling—20 tons per acre	1
Potatoes	1
Total number of acres	20

It is not supposed that the owner would rest satisfied with such produce per acre, and by reference to your columns many examples will be found of much larger produce, and of one or more cows being kept on about one acre. A rotation would have therefore to be adapted to the local circumstances, and improvements would be suggested by experience. The general system should be that of a garden-farm, which implies most careful and complete cultivation of every bit of ground, with high manuring and double cropping, together with stall feeding all kinds of stock, a most careful collection of every particle of manure, liquid and solid, from the house and offices, as well as the making of composts, and a sort of shed laboratory for the preparation of manures. A kiln for burning all rubbish, and if possible some piece of land for irrigation, at any rate a liberal use of the liquid manure by cart or horse to the Grass crops. The thorough working of the soil and subsoil is indispensable, trusting more to the spade than the plough; and in such a limited space, that portion intended for green crop should be regularly gone over in the Flemish style, by dividing it into widths and taking out with the spade intermediate spaces, throwing the soil on the surfaces of the adjoining piece, and and then picking and forking the hollow space, which in its turn is filled up, and the former ridge is made the hollow. The effect of a deep soil is thus obtained in the best way, and the extra moisture filters to the drains, which it has been taken for granted were made in the first instance. A different return might reasonably be looked for after such treatment of the land, and a produce of 50 to 60 bushels of Oats, 48 to 50 of Barley, 200 stones of hay, much larger crops of green food and roots might be obtained. Instead of Oats, Wheat would be grown. The stock would be increased by more cows and sheep, or bullocks, not omitting pigs to add to the muck manufacture, and give a few sides of bacon for disposal. The addition of a third horse or a pony to the establishment would be found a great convenience, and would give more satisfaction in doors, while it enabled the out-door work to be carried on without interruption. The horses we have supposed already on hand, but if too fine for farm work, which is seldom the case if they are of good temper, they should be exchanged for short-legged, compact, active horses, not large, but of good substance, taking a trial of them in a cart. The working condition of the horses will be found to improve, and the visits of the veterinary will seldom be required. A tolerably complete set of implements, suitable for such an establishment, would cost about 62*l*. As to offices, it is supposed that there are some which would answer the purpose, either connected with the house or land. We may in conclusion again advert to the useful and interesting occupation such a system of management would give to the owner, the superior quality of the supplies, the blessings the employment would be to several worthy labourers, the opportunity of giving really charitable employment, as well as a few roots or a little milk, and more especially the great general advantage to the country of agricultural improvements carried on with intelligence, and on the best principles; and it is moreover believed that this can be accomplished along with a greater economy in the establishment. *Forester.*

ALLOTMENT TENANTS.

I was highly pleased with your excellent defence of "the allotment system," as it is often vulgarly called; more especially with the ground you took when you said that the question is not always to be, what will make the labourer better for his master, but what will make him better for himself. Acting on this principle, when I came to reside here, about 4 years ago, I at once put into action "the allotment system;" and with the best and happiest results, I am thankful to say, both as regards the material comfort of the working men, and their moral conduct. In drawing up my rules I went on the principle—contrary to the advice of certain counsellors—of treating the labourers as men, and not as children; and instead of appointing a paid manager to look after the concern, and collect the rents, I gave them the power to choose a manager for themselves out of their own body; who, with another, appointed by myself from among their number, have performed their parts in every way to my satisfaction, and, I believe, to that of all the tenants. So much pleased am I with "the allotment system," and the good it does, in encouraging the good labourer, and employing the bad, who otherwise would be idle and up to mischief, that I have extended it this year on a much larger scale. I have also this winter opened a reading-room for the allotment tenants (about 60 in number), giving them the power to elect other inhabitants of the place, if they think them desirable, to become members of the said reading-room. I shall be very anxious to see how this reading-room will work, and shall watch its progress with much interest, and perhaps tell you of the results on a future occasion. The plan of it is simply this: To open a room, in some respectable house, for certain hours on certain days in the week, with a good fire and comfortable furniture. The members elect a committee of six, who manage the concern. Each member pays a penny a week. Honorary members give what they choose. The woman of the house, where they meet, is to provide tea or coffee for those who are willing to pay for it, and want it. I lend them some newspapers and books, and they take in some themselves with the subscriptions, part of which goes to pay for the use of the room. We hope, in time, that some of the farmers will join us as honorary members, and help us to establish a library. One of the committee is always expected to be present, when and whilst the room is open, to keep order, and look after the books and papers. Perhaps the above may be useful to some of your readers. *R. Thorp, Benton Overy, near Leicester.* ——Why do you stop short at the beggarly allotment system? Why do you not go for cottages with the same quantity of land attached as you let in allotments? Those were the dwellings of the rural labourer before agricultural improvement and high prices took the land away from him. I cannot see one earthly benefit in the "allotment system," beyond the name, which the others do not possess. Nay, I would go beyond this, and advocate the cottage garden system with gardens on a larger scale for those occasional labourers whom the farmer now employs in harvest and Turnip hoeing, and then turns adrift on the parish. I would have a source of profitable self employment for them when not wanted by the farmer; but down, I say, with the "allotment system." It perpetuates the evil by finding a palliative instead of a remedy. *J. T.* —— In your Number for Saturday, Nov. 16, you have made more copious observations than heretofore on the "allotment system." With much you have written therein we fully agree; but the thought that at one swoop the statements of your correspondent, "A Practical Farmer," on the same subject are to be buried in oblivion, is too much for many—ourselves among the number [and for us as well]. We are not converts to his opinion of its being "an Irish system;" and we have no wish to obtrude our remarks on the public—retirement is more congenial with our feelings—yet, we think, if you were to invite correspondence on the subject, it will be found "facts" will go far with some of the statements of "A Practical Farmer" thereon. We therefore appeal to you, as the judge who decided the case, to permit further evidence to be produced; and we move for a new trial, conceiving the verdict to have been contrary to important evidence which may yet be produced. We do this more readily, having encouraged the "allotment system," and made some observations on the effects produced. That making men feel they have a stake possessing them with some property, and furnishing them with means for obtaining more and better food, is likely to make them more fit to do the work of their employers, we readily admit—it should be so, and in many cases doubtless is so; but until they are better educated and possessed with right principles, we doubt if it will be found the case to any large extent. Let us refer to facts; "C." is a man with a wife and nine children. "S." is a man unmarried, each receiving 10*s*. per week wages; and each a plot of ground. "C." is a man conscientious, and for many years has not been known to neglect his duty nor wrong his employer. "S." was frequently known to rise "forward" and work his ground—also the ground of another; and at 6 o'clock go to his regular place of work; but frequently so jaded as to be unfit for it; consequently he might, without difficulty, be found resting himself full length in the stable or loft on a comfortable bed of straw; and as you would expect, his duties were shamefully neglected. Who could give such a man a character for honesty and industry? The man who thus steals his employer's time is dishonest; and if in one thing, he would not be scrupulous in another. It is easy to say, discharge such a servant, it has been tried by many, and generally without success; thus many are induced to tolerate great offences lest they should "only get worse." We happen to know that where there is one of the "C.'s" there may be 100 of the "S.'s." Take another view. You have employed many, and at the cost of some hundreds per annum; but your work is "chiefly done by the piece." We happen also to have expended some hundreds per annum for labour; but only partially "piece-work;" and that part, only because of the dishonesty of labourers. Case No. 1. This man was receiving 10*s*. per week (the lowest rate we have paid; others have 11*s*., and up to 15*s*.) from last autumn till near spring; but, honestly valued, his wages would have been 5*s*. He is put to piece-work, and can earn from 12*s*. to 16*s*. weekly at draining, hedging, or felling timber. Case No. 2. This man was employed at hurdling, day work; he could manage to get four to five done in a day (12*s*. per week wages). "Put on piece-work he was another man; for, at 3*s*. per dozen (making only), he could 'alter the stroke now,' his own words, and make 10 and sometimes 12 per diem!" Thus we think we have shown that a new trial should be had, and that a "common jury" of correspondents should be summoned to give their verdict (after you have summed up) according to the facts produced; or, at least, that the advocates of this system should be called upon to show cause why the judgment of the court (hitherto in their favour) should not be reversed. *Justicia.* ["Take a rule to show cause."]

Home Correspondence.

Liquid Manure and Peat Charcoal.—In one of your recent numbers I read your very judicious suggestions as to the use of peat charcoal with liquid manure, than which few things could be more desirable. But, to my surprise, I subsequently find a letter from "Celt," in which he says he "is sure it would be ineffectual," and states as follows—"Charcoal has also the property of clarifying any liquor passed through it. It readily parts with the gas it absorbs—for instance, if it contain as much ammonia as it was capable of holding, and was in that state immersed in water, the ammonia would be dissolved out. If therefore liquid manure was passed through the charcoal, the ammonia it could condense would only be the portion that was dissolved in the small quantity of water retained in its pores. The liquid would be to some extent deprived of its colour by the removal of the colouring matter suspended, but not a fraction of the really valuable soluble matter would be removed. By immersing the charcoal, the only benefit would be the removal of that portion of the liquid retained in its pores, no difference would be made in what was left."—*Celt.* It is much to be regretted that "principles" should be allowed to be attacked by those who do not give their real names in support of their views—the more particularly when these views are so dogmatically laid down, whilst they are utterly fallacious, and contrary to the proved properties of peat charcoal. If intimate contact of peat charcoal take place with water charged with ammoniacal and other gases, the affinity is so strong, that within a certain time (depending upon the size and nature and preparation of the charcoal) the gases will take possession, and expel the water. So far from the quantity of ammonia condensed being "only" that contained in the water occupying the pores—the pores will draw in ammonia and drive out water—and by "immersing a sufficient quantity of peat charcoal in liquid manure," the water passing away, especially if allowed to filter upwards through it, will be divested of its gaseous contents, until the charcoal has become charged with gases. That such is the fact can be readily proved. Take a quantity of sewage water, place it in a glass vase; put into it even lumps of properly made peat charcoal, and let it lie for a period proportioned to the quantities. In a short time the water will become pure—I may say, perfectly pure, if the quantity of charcoal be in proper proportions. Although when the lumps of charcoal be first immersed the pores are of course filled with water till the immediate change takes place; still, within a given time, the impurities, it may be said, are seized by the charcoal, and taken from the water. Why or wherefore "Celt" assumes the contrary I cannot understand. Should you wish to try this experiment I shall be happy to send you a lump of peat charcoal for the purpose. *Jasper W. Rogers.*

Poultry, Diseases of.—Some two years since, there appeared in the *Gardeners' Chronicle* a number of very interesting articles, from able contributors, on the diseases to which poultry are liable, at the various seasons of the year. I was at that time a learner, and an attentive listener; and I profited in no small degree from the oft-continued discussions in your paper. I have since kept a large quantity (for an amateur) of domestic poultry, and have succeeded with them so well, for the last 18 months more particularly, that I feel it a pleasing duty to communicate, *pro bono*, my mode of treatment, which is simple but effective. I have had new-laid eggs nearly all the year round; and am at the present time in the daily receipt of some half dozen—nearly all the hens giving unmistakeable indications of speedily becoming members of the "lay-ity." I have had but one death in the family since January; and that was recently—during the "fall of the leaf"—from atrophy. My poultry-yard exhibits pleasing evidence of the most robust health and vigorous constitutions prevailing amongst all the inhabitants. I allude to the Sebright bantams, and the more choice varieties, as well as those of the more common kind. I have one Sebright gold spangle hen, weighing not more than six ounces. This little darling pet—for such she is, in the fullest meaning of the words—has not known an hour's sickness throughout the year. It has been the same with others equally tender. But to the subject matter in hand:—Round each of the poultry "walks," I have planted a complete hedge of Rue—the medicinal qualities of which, in combination with proper food, are remarkable. The heads of these plants are bent forwards, and introduced through the circular galvanised

iron wire holes, which form the front of the "walk." I find, from time to time, that much of the Rue is eaten, Nature evidently indicates the "why" and the "when." Of course the houses where the birds roost are thoroughly cleansed, thrice weekly—in summer, daily. They thus enjoy "sweet" sleep, and escape being poisoned by the foul and impure gases, which would, but for this precaution, necessarily arise immediately under their nostrils. Herein lies a grand secret, and the hint is worth picking up. A constant and liberal supply of fresh water should never be neglected under any circumstances. This is immensely important. I keep them well supplied with old mortar, pebbly gravel, red sand, and brick-rubbish—throw them in twice a week a quantity of raw, juicy Cabbage leaves, and long Grass; occasionaly some boiled Potato parings, rice, and fragments—feed them twice every day (at half-past 7, and half-past 1), with Oats and Barley, mixed; and turn up with a spade, twice a week, the raised ground which forms their "walk." By this last move, some scores of underground inhabitants become disturbed, and rise to the surface. The fowls by this, get an extra benefit. I have always christened this feast, "the Diet of Worms." The "walk" being thus frequently turned up, is kept perfectly sweet and wholesome; and the water, filtering through the earth, leaves the surface clean and dry. Hereby are the fowls preserved in a rude state of health. To enable them to get the full benefit of what little sunshine there is, at this season, I elevate their outside perches (square perches, of course) to the fullest admissible height. This supplies them with air and exercise, and, in my opinion, adds to their happiness in no small degree, by affording them an extended prospect. *William Kidd, New Road, Hammersmith.*

Irish Moss.—The enclosed was given to me this morning by a farmer as a specimen of Irish Moss, which he is buying for feeding purposes of a druggist, at the rate of 2½*d.* per lb. It is used thus:—1 lb. is boiled for a long time in 6 gallons of water, which forms a jelly much resembling that from linseed, and this is mixed with other food, such as meal; if for pigs, &c., chopped straw, or hay for beasts. The farmer who gave it me thinks well of it, as the animals eat it well; but as many agriculturists speak only from guess, and not from weighing or measuring, or even from comparative experiments, I wish to ask what your opinion of its feeding properties may be, and also whether it is not Sea-weed instead of Moss? and if so, whether it should not be procured at a less price than 2½*d.* per lb.? Also, if it should be found valuable for feeding purposes, how far it would be useful as an enricher of the dung-heap in comparison with Linseed-cake. *W. Squire Ward, Ollerton.* [The mucilage obtained is a kind of starch, and we should suppose it to be of comparatively low nutritious character; and the article to be not worth so much as Bean meal, which can be had for less than 1*d.* per lb.]

Wheat Growing.—I very cheerfully comply with the request of your correspondent, of the 16th, relating to 10 questions upon the growth of Wheat. I should be glad to add a little oil to the agricultural wheels, for they seem to travel rather slowly. I know but little about farming, and most of my neighbours think the same, for as of old, "A prophet has no honour at home." However, I think there is no harm in growing all the corn you can, nor yet in making all the employment you can, especially if they can both be done profitably. In answering the 10th question, I risk giving offence to many tenant farmers, who think, or pretend to think, that my cultivating a few acres of land in a way no one before ever thought of, raises the rent of land. It seems to me very preposterous, if they thus think, for not half a dozen farmers have tried the non-ploughing, thin sowing, clean hoeing, Wheat growing system. Now then for the answers to the questions:

Q. 1. The nature of the soil and subsoil on which the Wheat is grown?	*A.* Some part light, some hollow-bottom, or meadow soil, and part heavy. The subsoil, a tender loam, or sort of brick-earth.
Q. 2. The height above the sea?	*A.* I should think about 100 feet, and about 20 miles distant.
Q. 3. When is the corn dibbled in?	*A.* The usual time, or rather early, say fore-part of October.
Q. 4. What manure, and how much per acre put on?	*A.* Generally 60 bushels of soot per acre.
Q. 5. The cost of manure?	*A.* Two pounds, including carting and sowing.
Q. 6. Does he harrow the ground after sowing?	*A.* Yes.
Q. 7. Is the manure applied at seed time, or in spring, as top dressing?	*A.* Neither; I think, mostly in February.
Q. 8. How often is the Wheat hoed, after the Wheat is up, before harvest, and whether by horse or hand?	*A.* Twice well hoed, and once picked over, say in June; all done by hand.
Q. 9. How many acres does he plant in this way?	*A.* "Aye, there's the rub." Between one and two acres.
Q. 10. What has been the average of his crops up to last harvest?	*A.* Forty-two bushels. The ground is not suitable for Wheat, and has 55 trees to the acre.

In conclusion, I would say, I shall be happy to be catechised in any way, any of your correspondents think fit. *J. D. Piper, Colne Engaine.*

Farm Accounts—I have read with pleasure the letter of your correspondent, "W. F.," page 731, on this subject, and as he proposes going more minutely into detail on a future occasion, I would venture to suggest that he should strongly impress upon farmers the necessity of keeping their farm accounts entirely distinct from their housekeeping or family expenses. The farmer should debit himself and credit his farm with every Potato, egg, pint of milk, and pound of butter, &c., consumed in his family, and even with a portion of his rent, as house-rent, and he will then find that his farm pays better than he thought it did. This is nothing more than a fair mercantile system. *T. F., Birkenhead.* —Be pleased to convey my thanks to your correspondent, "W. F., Gay Bowers," for his opinion upon farm account-keeping. From his evident knowledge of the subject, he is an authority worthy of attention, and I shall read with great pleasure any other paper with which he may favour us. I presume that, in addition to the set of account books "W. F." mentions, it would be necessary to keep a stock book in which to enter the dead stock with the respective prices annexed. Your other correspondent, "J. R. Markly," would confer a favour by explaining what the alteration is which he recommends to be made in the labour account book of the Royal Agricultural Society. *E. T.*

"*No Business so ill conducted as Farming*," *No.* 2. —If the old grocer who said so, had not known where to find each article, when wanted by a customer; and if he had suffered his tea to get mouldy or fusty, and his sugar and salt to melt, from the dampness of the place where they were kept, he would not have been likely to have become a landowner. And yet that would only be parallel conduct with what has been, and still is, commonly practised on farms. How much seed, manure, and produce of crop and stock have been wasted from want of drainage! How recklessly have the virtues of manure been dissipated by exposure to air and water! How often has the farmer lost as many pounds because he thought he could not afford to spend as many shillings as would have prevented that loss! How commonly do we see weeds devouring the food of the crop, because the farmer will not be at the pains and expense of cleaning his land and keeping it clean, though in a few years the expense would be far less than the amount of the injury done by the weeds! It is painful to multiply instances of neglect or mismanagement, especially so to an old farmer who must candidly confess that he has himself been guilty in many such cases. He would not expose his own errors, or those of other farmers, if it were not from a desire that they may be avoided. The importance and necessity of drainage and other improvements has been repeatedly urged, and yet we can scarcely find a tenanted farm which can in all respects be exhibited as a model for imitation. What then is the inference? Surely we are constrained to confess that there is far too much truth in the apparent severity of the grocer's rebuke. Where, then, are we to seek for the remedy? Not merely in one or two improvements, but in rectifying all our errors, and following up all known improvements, and seeking eagerly for a further progress, in accordance with the age of invention in which we live. We must begin with a better system of hiring farms; that is the first step, without which we cannot hope for such perfect cultivation as these times demand. The next thing is to mind that no man occupies more land than he is capable of managing, not in the old heedless way, but according to the most perfect management. Still we cannot hope for the requisite improvement in the cultivation of the soil, unless the mind be cultivated also. If it be true that "knowledge is power," that power must be attained by education. The sort of education required by the sons of farmers and labourers is different from that which towns-people require. The village school should be industrial as well as intellectual. Some land should be attached to it, and the pupils should take their regular daily lessons in the field as well as the school; agricultural experiments and accounts should form a part of the tuition. When mental and manual teaching are practised daily, the one becomes a relief from the wearisomeness of the other, and the scholars make good progress in both at the same time; whereas, when taught at separate periods, they have each an injurious effect upon the other. I quite agree with your correspondent, "Falcon," in thinking that, for labouring people with only common intellectual powers, the education should be merely rudimental, consisting of reading, writing, and the first rules of arithmetic. But in all education, moral and religious principles should be inculcated; without these, it will only prove a crime instead of a blessing—the educated bad man is likely to be more injurious to society than he would have been without his education. The education of the farmers' and labourers' sons may very properly be carried on together, at a well-conducted industrial village school. From this, the farmer who can afford it may send his son to a higher kind of agricultural school, where he may be taught in company with the landlords' sons; and thence a few of the most intellectual of the richer farmers' sons may go to the Agricultural College, and there also the sons of landlords should be sent, that they may acquire such knowledge as will qualify them for those duties that will devolve upon them. Such intercourse with the different classes will, in various ways, have a beneficial influence. Education will drive away prejudice, which is a great bane to agricultural improvement; and it will enlighten the mind for the discovery of many more improvements at present unthought of, but which, in this age of invention, we are required to discover. *O. F.*

Animal Heat.—All contributors, whether to the amusement or the instruction of the public, seem impressed with the notion that they must provide a good deal for the money. We fancy this is a mistake, for we hear continual complaints that operas, concerts, and all dramatic performances are too long. Newspapers have become an awful tax upon the time and sight of this generation. They have grown from the small sheet to the broad sheet; from the latter to many sheets; from a readable type for the eyes of middle age, to one requiring the optician's aid; and you, Mr. Editor, have of late given us some of the most interesting portions of your *Gazette*—discussions at some of the farmers' clubs and meetings of agriculturists—in a type which we apprehend was invented at Laputa, for we have been obliged to apply a lens of considerable power to read it with any degree of comfort. As we have read nearly every number of your meritorious and instructive periodical in the horticultural as well as the agricultural department from the first to the last, allow us to suggest to you what has occurred to us and other readers of our acquaintance, that quality is infinitely more acceptable, and more highly appreciated, than quantity, and to "whisper in your lug," that there is ample space in your sheet for all really valuable matter in a type that would be acceptable even to eyes of a certain age. You must bear in mind that the oldest of your readers has yet much to learn, more especially in the science of agriculture. We venture to suggest, whether you do not carry your good nature somewhat too far in the admission of many contributions which evidently come from gentlemen who have recently awakened from a trance, or who, at any rate, must have been in a dormant state for some years past; and who now give us, as original and novel information, matter which was perhaps engaging their attention when they entered into their state of repose. An instance we may mention of a recent occurrence, under the title of "Animal heat," in which the writer, having noticed that much had been published on agricultural chemistry, farming operations, &c. &c., but that one of great importance had escaped the notice of those scientific men who had thrown so much light on such subjects, promised that he would illustrate this in as concise a manner as possible. Having, as a matter of taste and duty, kept ourselves *au courant* in horticultural and agricultural lore, our curiosity and appetite were greatly excited to discover and feed on this new light, which had escaped the observation of Liebig, Johnson, and other discoverers. We read paragraph after paragraph with increasing impatience at what we felt was a very long introduction, when at length we came to the end of the article, without meeting with an atom of information but what has been communicated years ago by the scientific men the author referred to at the outset, in a much more clear and intelligible manner, with one exception, which seems to have struck a contributor to your last Number. That we must admit to be quite original, and perfectly new to us. We studied Richeraud many years ago, who was esteemed a high authority on physiology, but we were not aware, prior to Nov. 2d, A.D. 1850, that the food, after being reduced to a pulp in the stomachs of us mortals, "was removed to the liver," and then passed through the lungs. Our notion was, that after undergoing the process of chylification, it passed elsewhere. *O. L.*

Poultry.—On the 28th of Nov., 1849, I had a cock and pullet of the Cochin China breed sent me; they were then each about five months old. The pullet commenced laying early in December, and has up to this time produced five broods of chickens. The first brood was hatched January 22, 1850; the second, April 6; the third, June 13; the fourth, Aug. 19; and the 5th, Nov 21. The hen is a good nurse, but as she commences laying eggs when the chickens are from 28 to 30 days old her young progeny are soon deprived of her care. When she has laid from 18 to 20 eggs, which she does in about 24 days, she incubates, in fact she has a constant succession of occupation—producing eggs—incubating and attending to the wants of her young broods. I have distributed most of the chickens of the early broods amongst my friends, but I have in my own flock one pullet of the first brood; she has reared seven chickens and is now laying. I have also one of the second brood; she is laying, and I am in daily expectation of having eggs from three pullets of the third brood. The fourth brood, which consists of 10 chickens, are fine healthy young birds, and as the winters here are generally very mild, I hope the fifth brood will do well. My fowls are always confined, but each compartment of the building has, attached to it, an open space fenced in. I keep the houses and yards clean, feed high, and always have my fowls in good health and condition. *R. H. Bowman, Penzance.*

The Deep Drainage of Clay Soils.—The money that has been uselessly expended in attempting to drain clay soils, with drains inserted only 2 or 3 feet from the surface, is so considerable, that all information is valuable which shall tend to give confidence in the system of deeper drainage, which experience and scientific reasoning show to be the more effectual and serviceable, even if the shallower drains, by their more frequent insertion, equally carried off the water from the surface. It is with a view to show the capability of the rankest clay being drained by drains of 4 and more feet in depth that I call attention to a most striking instance of the result of very deep drainage of a rank clay in the neighbourhood of Barnet, and where the London clay reaches the surface in its greatest purity and strength. The Great Northern Railway has tunnelled 37 feet under a garden, which for the last half century at least possessed a never-failing pond. Whilst the navigators were at work making the cutting, the proprietor, a skilful agriculturist, amused them by foretelling the loss of this to him most valuable supply of water, whenever the completion of the tunnel should

have admitted air through to sufficiently dry the bank of clay which lies between the top of the tunnel and the bottom of his pond. What then appeared so improbable has now happened. The tunnel has been completed above a year, the basin has been tapped, the water in suspension has evaporated, the clay has shrunk, the pond has cracked, and the water has all disappeared. The moor hens have lost their ancient home, and this autumn the Water-lily and Bulrush are dead. This curious fact was pointed out to me by the proprietor of the garden and of the surrounding land, much of which he has already drained by 4 feet drains, and what remains undrained he is about to do by means of a Government advance, so satisfied is he of the benefit from deep draining of clay land. *Hewitt Davis*, 3, *Frederick's-place, Old Jewry, Nov.* 11.

Covers for Dung-heaps.—I am particularly struck with the concluding passage of an article marked "C." in your Number of the 9th inst., treating of the management of liquid manure, &c., which runs thus: "The latest form which this search after novelties has taken, is the cover for the manure heaps. It would certainly be useful to provide such accommodation; but is a cover for the dung-heap the first requisite of the present day? For instance, before providing such a building, would it not be advisable to provide permanent sheds for corn and hay? The plain practical utility of such a suggestion has, we fear, little charms for the advocates of covered dung-hills. Plans of farm-buildings have already been published with the latter, duly marked; but we have never yet seen a hint of the former, though we certainly think that shelter for corn ricks is a much more important matter than a cover for the dung-hill." Perhaps "C.," although an occasional writer in your Paper, does not deign to read the contributions of less able persons than himself, or he certainly could not have penned the concluding lines of the passage to which I allude, inasmuch as in several of your Numbers, pointed notice and strong recommendations of its practically economical utility has been made by me of what "C." calls "permanent sheds for corn and hay." Should "C." ever honour this part of Cumberland with a visit, I would be glad to show him a permanently roofed stack or rick-yard of mine, which has been in existence for six years, and also some others which have since been erected on its plan. I could likewise show him my roofed dung-hills, which I as strongly advocate as roofed corn-stacks. Should "C." then not approve of these erections, I could only say he would be the only dissentient of the many distinguished agriculturists who have come from far and near to visit them. *Jas. Robertson Walker, Gilgarron, Whitehaven, Nov.* 12.

Hay-Chaff Cutters.—In a late Number, you say "The farmer was also provided with a hay-cutter." "This also we found had been disused." "The tenant reported favourably of the plan of crushing Oats for horses." I, too, have a hay-cutter, and an Oat-crusher, like everybody else, but, like your friend's hay-cutter, both are disused. But, unlike your friend, I doubt whether both are not positively wasteful, independent of the labour. I bought these implements, and have used them for some years, because everybody else did; however, the following circumstance has caused me to pause, and I shall be glad if I can provoke a discussion in your columns on the subject. I fear, in these days, agriculturists are too apt to seize hold of every novelty as useful, without sufficiently weighing the matter. Having a young horse, which I was getting into condition for sale as a harness horse, I watched his progress closely, and frequently took him out for exercise in my Whitechapel to the neighbouring towns. Having been for sometime dissatisfied with his slow improvement, I was one day, after feeding him at a livery stable, surprised by his increased gaiety, so much so as to determine me to observe him narrowly, whenever he was again fed (on uncrushed Oats) from home, and also to watch my stable man more closely in his feeding him. On several occasions afterwards I found him gayer after his feed from home than he was when coming out fresh from his own stable; and as I had satisfied myself that all was right at home, I ordered him to be fed on uncrushed Oats, and the change in the horse in one week was astonishing. Since that time I have ordered my cart horses to be fed on uncrushed Oats and unchopped hay, and I am satisfied that on the same work, with less feed, my horses are in as good, if not better condition, than they were this time last year on chopped hay and crushed Oats. I think the indiscriminate use of the hay-cutter and corn-crusher is bad. What will suit the constitution of one horse will be unsuitable for another. The saving time, the farmer says, in the horse's filling his belly is the great thing; but I say, if half a bellyful does him more good than a full one, let him go to his work with a half bellyful. If at dinner I fill my belly in 10 minutes, I am hungry again in an hour, whereas, if I take three-quarters of an hour to it, it lasts 3 or 4 hours. I am inclined to think that the horse finding his food chopped ready for him, does not chop it sufficiently for himself, but bolts it; and for want of the saliva, which accompanies the food into the stomach when masticated naturally, it passes through him ill-digested, and a greater quantity is consequently required to keep up his condition. If I am right in the above view, its publication may benefit somebody; if I am wrong, perhaps somebody will benefit me by exposing my error. *John Kay, Chorley, Cheshire.*

Roots in Drains.—I send a specimen of some fibrous substance which I found lately had stopped one of my drains, a pipe tile, 3 inches in diameter. The drain was a main drain 4 feet deep, running through the middle of a field, and at no place near any tree whatsoever. It is a curious circumstance, the small pipes 1½ inch bore running into it, were all clear, but this fibrous substance had penetrated the main drain in many places. It has only been laid down four months; subsoil clay, mixed with stone. I have done much pipe draining for the last three years, and have never seen such a thing before. The field is now in Wheat, Rape having previously been eaten off by sheep. Query, is it root of Rape? My drainer says it tastes bitter, like Rape. Can you enlighten me? *North Devon.* [It seems to be the root of Rape, by its taste.]

Drainage Act.—In answer to a remark by Mr. H. Davis in the *Agricultural Gazette*, I have to state that I borrowed 400*l.* under the Drainage Act which was all spent on actual drainage, and that the amount I received was only 365*l.* some few shillings, the balance of 34*l.* being absorbed in Government charges, and two visits of a surveyor. Moreover that the machinery of the Act, apparently so simple, was in my case, and that as simple a one as could be, excessively complex; letters passed without end, and the money not paid until some considerable time after completion. I borrowed merely as an experiment, to see if it would answer for small freeholders; but I am quite convinced the Government charges, the limitless correspondence and delay in repayment, render it perfectly unavailable—at least in its present arrangement. *J. T., Swansea.*

Growing Rape for Seed.—As I observe in yours of the 16th, some experiments respecting its management, I will give you the way it is grown here. The land intended for it, ought to be in good heart and ploughed immediately after harvest, and well harrowed, the weeds and stubble gathered together and burnt; it may then be ploughed again or scarified, it makes little difference how, so that it is got into fine tilth. This is absolutely necessary, as, from its being such small seed, it is difficult to plant well, unless the weather is favourable. The land must have a good dressing of dung, pretty well rotted, as it gets better mixed with the soil in working it than when it is long. It is the best way to drill the seed in about 1 foot apart, or 1½ on very good land. They will succeed well if transplanted, but this involves much labour and expense; and after paying much attention to it, I have always found the greatest quantity of seed from that sown where it is to stand; there is one advantage in sowing it in a seed bed, you can choose your own time in putting in the seed, when the ground and weather is suitable; for if the weather is very dry after harvest, it is almost impossible to get a plant; and it should be sown as soon after harvest as possible, as the plants then have time to gain strength before winter, and you may thin them out in the autumn when your people are not so fully employed as in the spring. We have not always thinned them out at all, only giving them a rough hoeing in the spring, but the last two years we have singled out part, and left part. That part thinned out has yielded nearly two quarters per acre more than that left, and the seed is of a finer quality, and it enables you to stir the ground well with the hoe, and keep it free from weeds. If transplanted it should be done with the first favourable opportunity, after the land is got into a fit state, and the weather suitable (that is, the ground moist, and showery weather); the plants may be either dibbed in, like Cabbage plants, or planted in the furrow, the plough covering them the next bout; but whichever way it is done, nothing but short bushy plants should be put in, as the long stalky ones never branch out like their stouter brethren, and they are liable to be killed by the frost; it is ripe about the latter end of July, and is reaped with the sickle, and laid in small heaps, just large enough to be turned readily; but if fine weather, it does not require turning much, as it readily shells out. We thresh it in the field, making a floor by clearing a square space about the middle, and raking the ground fine, then well watering it till like puddle; we then cover the space with about a foot thick of haulm or short straw, and set fire to it; when reduced to ashes, we roll with a heavy roll, and the floor is ready to thresh upon when dry. *E. X., near Braintree.*

On the Growth of Gorse or Furze.—Will you allow me, through the medium of your Paper, to give a few remarks upon the cultivation of this most valuable of plants, which has been proved for a long time to be a most excellent food for cattle and horses, as a substitute for hay. It is thought that there is much difficulty in growing Gorse. This idea Nature seems to contradict, by producing it upon all soils and situations, and upon which I have seen the crop equally good. I consider April, to the end of June, to be the best time for sowing. The soil should be cleansed and pulverised, as the seed is best put in with the drill, at 8 inch rows; and 20 pounds of seed to the acre. The plant thrives best, certainly, upon sharp sands. Having a deep sand, or rock, with a dry subsoil, I have seen 8 or 10 tons per acre produced on a soil not worth 5*s.* per acre, and for this reason, I would advise 20 bushels per acre of sand of the sharpest grit to be put in with the seed upon all soils not having sand in them abundantly. I collected from a bush 28 seeds, in March, and the same hour put them into the ground: that summer only three came up, and five more the following summer. This proved the opinion to be wrong, that such an occurrence was from old seed. I have no doubt all the remaining seeds would have come up at different periods, when it so happens. This gave me much assistance in growing the plant, being aware the slug is the greatest enemy when the plant just comes out of the ground, and only in its first two leaves, and at that time easily devoured by it; but, if it escape to the next leaf, it is then safe; this induced me, with perfect success, to save several crops, by carefully watching the plant from time to time; and, when the slug did appear, to apply 1½ cwt. of saltpetre per acre. A crop, by this means, will be easily secured; for, when the plant is past this stage, it is safe. Hares, rabbits, sheep, &c., being the only remaining enemies that will destroy it. Though I advise 20 lbs. of seed per acre should be sown, if a quarter of that seed come to maturity, it will produce plants enough for a full crop, which is 8 or 10 tons per acre. Eight tons will produce 1200 or 1300 bushels per acre, which is enough to keep two horses or cows 26 weeks. I have proved, by careful trial, with a cow fed upon Lucerne in July, and in November upon Gorse, that the cream and butter when the cow was fed upon Gorse to be quite equal, or rather exceed in quantity and quality the feeding upon Lucerne in July, and far exceeding all other Grasses, Clover, or Vetches, &c. *C. W. F.*

Thin Seeding.—Last year 6 pecks of seed Wheat drilled had a trifling advantage over one bushel of seed, some plants having been destroyed by slug. This year the bushel has a little the best of it, say one gallon per acre, besides the two pecks of seed saved (yield 36 bushels per acre); still, to make all safe, and guard against loss from casualties, I have drilled from 5 to 6 pecks per acre, which appears a safe average quantity on my land. I do not think we can lay down a general rule for all soils or climates. The higher the condition of the soil, and the earlier we sow, the less seed we should put in. Several years' trial has convinced me, that on *my* land one bushel of seed Wheat will produce more than will two bushels, by the rent of the land. Generally speaking a great deal too much seed is sown; every agriculturist should satisfy his own mind by altering the drill wheel on a few lands. The comparison would astonish some of the three-bushel men. Possibly experience may have taught the Cotswold-hill farmers, at 500 feet above the level of the sea, that they must get a thick and early plant to protect the *roots* from freezing, which would destroy the plant. The same cause may also operate with the light sand land farmers on the east coast of Norfolk. I have seen whole rows of Wheat destroyed by the *roots* getting frozen (especially when late sown), before the roots have got deep into the soil. The solidification of light soils by dibbling or heavy rolling will tend to prevent such casualties; 2 cwt. of salt per acre, mixed with 2 or 3 cwt. of guano, and harrowed in with the seed, tends to solidify and bind the land, and excludes atmospheric influence. I have seen Mr. Piper's, and other Wheats, from 1½ peck of seed, and a more abundant crop of corn or straw could not be produced. His system of not ploughing and dibbling the Wheat naturally excludes frost, slugs, and insects, and diminishes the chance of loss of plants. I know a large practical farmer in my parish, who rolls his heavy land after ploughing with a stone roller weighing two tons, and drills after the roll, generally sowing in November. His quantity of seed varies from 5 to 6 pecks, and he grows good crops. Most of his Wheats are after one year's Clover or Beans. Sowing guano and salt with the Wheat or any grain is a wonderful protection against all the insect tribe, wireworm included. They cannot stand ammoniacal salts. After Rye-grass I have a capital plant, so treated, although it looked very rough and unpromising, and every one condemned the field to fail. I am glad to see my friends Wilkins, Davis, and others practising and discussing the matter. It is quite clear there is nothing to be angry about. I always horse-hoe my Wheats with Garrett's horse-hoe. *J. J. Mechi, Tiptree-hall, Nov.* 26.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House in Hanover-square on Wednesday last, the 4th of December: present, His Grace the Duke of Richmond, K.G., President, in the Chair; Mr. Raymond Barker, Mr. S. Bennett, Mr. Brandreth, Mr. W. G. Cavendish, M.P., Colonel Challoner, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Kinder, Professor Sewell, Mr. Shaw of London, Mr. W. Simpson, Mr. C. Hampden Turner, and Professor Way.

Andrew Arcedeckne, Esq., of Grosvenor-square, and Glevering Hall, Suffolk, was elected a Governor of the Society.

The following new Members were elected:

Peto, Samuel Morton, M.P., Somerleyton Hall, Suffolk
Clifford, William, Parliament-street, London
Watson, Henry, Londonthorpe, Grantham
Humphreys, Henry, Beaumanor Park Farm, Loughborough
Stewart, Arthur, Stafford-terrace, Heavitree, Exeter
Gosford, Vincent, Cheriton, Alresford, Hants.
Stuckey, Walter (Banker), Grove Cottage, Yeovil, Somerset.
Mahon, H. Sandford Pakenham, Strokestown, Roscommon
Morgan, Lewis, Hafod, Pont-y-Prydd, Glamorgan
Dalton, Thomas, Cardiff, Glamorganshire
Dashwood, Maitland, Scotsborough, Tenby, Pembrokeshire
Davis, Richard Francis, 34, Connaught-square, London
Lewis, Wyndham William, The Heath, Cardiff, Glamorganshire.
Parrington, Thomas, Marton, Cleveland, Durham
Bennet, R. G., Tresillian, Newlyn, Truro, Cornwall
Permewan, Nicholas, jun., Trevethow, Lelant, Hale, Cornw.
Smith, Parker, Caythorpe, Grantham, Lincolnshire
Randolph, James, Milverton, Somersetshire
Lloyd, Francis Edwardes, Kilybebil, Swansea, Glamorganshire.
Hymers, Robert, Marton, Stockton-on-Tees, Durham
Heath, R., Liverpool
Clark, Henry, Berkeley-square, Bristol
Badham, G. D., Sparrow's Nest, Ipswich, Suffolk
Strode, James Cranbourn, Hollington, Hastings, Sussex

Rutter, James, Roxwell, Chelmsford, Essex
Alexander, Horace, Surinam-terrace, Stratford, Essex
Goring, Rev. John, Wiston Park, Steyning, Sussex
Rowley, Hon. and Rev. Thomas, Rhydorddwy-Faur, Flintsh.
Simpson, William, Kirby-Grindalyth, Sledmere, Yorkshire
Easton, James, Grove, Southwark
Aytoun, Marriott, Coates's-crescent, Edinburgh
Aveling, Thomas, March, Cambridgeshire
Barrow, John James, West Burton, Gainsborough, Lincolnsh.
Summers, George, Stoke-Wake, Blandford, Dorset
Gadesden, James, Ewell Castle, Surrey
Piercy, Alfred, Hurley, Marlow, Bucks.
Price, John Robinson, Westfield Farm, Montrath, Ireland
Sims, Thomas, Downiehills, Peterhead, Aberdeenshire
Bolton, Thomas, Ballykisteen, Tipperary, Ireland
Midgley, W. H., Ercall Park, Wellington, Salop
James, John, Whitechapel-road and Leadenhall-st., London
Kelsall, Henry, jun., Rochdale, Lancashire
Ewbank, Charles W., Port Eliot, St. German's, Cornwall

The names of 10 candidates for election at the next Meeting were then read.

FINANCES.—COLONEL CHALLONER, Chairman of the Finance Committee, presented to the Council the monthly report of the accounts of the Society; from which it appeared, that, at the end of the previous month, the current cash-balance in the hands of the bankers was 769*l.*

GUANO.—Viscount PALMERSTON, her Majesty's Principal Secretary of State for the Foreign Department, transmitted to the Council, through Lord Stanley, of Alderley, important documents connected with the supply of Guano to this country, founded on a communication of facts resulting from inquiries instituted by Lord Palmerston's special instructions in reference to that important question. At the request of the Council, the Duke of Richmond, as the President of the Society, and as feeling anxious under any circumstances to promote measures by which a more abundant and a cheaper supply of valuable manure may be furnished to the practical farmers of this country, kindly undertook to confer with Lord Palmerston on the subject, and to report to the Council the result of such interview with his Lordship.

SHOW OF 1851.—The Council gave directions for the General London Committee of the Society to be summoned to meet on Wednesday next, for the consideration and despatch of business connected with the Society's arrangements for their show of breeding stock in Hyde-park next year.

The Council then appointed the standing Committees for the year 1851, and adjourned to their weekly Council on Wednesday, the 11th of December, at 12 o'clock, at which, as usual, all members of the Society would have the privilege of admission for the reading and discussion of papers connected with practical points in agriculture.

HIGHLAND AND AGRICULTURAL, *Nov.* 20, (*Mr. Moore's remarks continued from page* 766).—The following is the report of the experiments made in 1836.

A committee was appointed by the East-Lothian Agricultural Society to superintend the experiment. The cattle taken for the purpose of the experiment were 20 polled Aberdeenshire oxen, three-year-olds, which were purchased at Falkirk October Tryst, and were equally divided into four lots, five in each, on the 24th of that month, and immediately placed into separate courts, each of which had ample space and shelter from the weather by covered sheds. Each lot of cattle had a mixture of food allowed them along with Turnips, with the exception of lot No. 1, which was fed altogether upon Turnips and straw, and may on that account be designated the trial lot. No. 2 had half the quantity or weight of Turnips which was allowed to No. 1, with 30 lbs. oilcake, as a substitute for the less quantity of the Turnips. Lot No. 3 had the same weight of Turnips, which was given to No. 2, and had ground corn in place of the oilcake. The 4th lot got offal from a grain distillery, and a portion of bran-meal, which was mixed into their draff every morning. By following this arrangement we have ascertained the quantity of Turnips saved; the value of the Turnips in feeding by themselves, contrasted with that of the other substances; and their value as an auxiliary feeding when used with those richer substances, which, without some coarser food, will neither be an economical nor a beneficial food for cattle. All the lots had fresh straw given to them daily, but which was not weighed; and below is a statement of the food consumed, and the expense incurred in the fattening of each lot:

1836.	Lot No. 1, fed on Turnips.		
October 12.	To price of steers, at 11*l.*	£55	0 0
24.	10 days keep of do., on Turnips and straw, at 8*d.*	1	13 4
1837.			
January 1.	34 tons White Globe Turnips, at 8*s.* 4*d.* per ton, since 24th October, being at the rate of 3 cwt. to each, per day ...	14	3 4
April 7.	38 tons 16 cwt. Ruta Baga, at 12*s.* 6*d.*, since 1st January, being 8 cwt. per day	24	5 0
June 7.	21 tons 8 cwt. Ruta Baga, at 12*s.* 6*d.* since 7th April	13	8 2
		£108	9 10

The average expense of the keep of this lot is about 6*s.* 2*d.* per week, each beast.

1836.	Lot 2, fed on Turnips and Oilcake.		
October 12.	Price of five steers, at 11*l.*	£55	0 0
24.	10 days' keep on Turnips and straw, at 8*d.*	1	13 4
1837.			
January 1.	17 tons White Globe Turnips, at 8*s.* 4*d.*	7	1 8
April 7.	19 tons 8 cwt. Ruta Baga, at 12*s.* 6*d.* ...	12	2 6
	1 ton 18 cwt. foreign Linseed cake, at 7*l.* 15*s.* per ton, from 16th Nov. till this date	14	14 6
June 7.	10 tons 14½ cwt. Ruta Baga, at 12*s.* 6*d.*....	6	14 1
	16 cwt. 38 lbs. Linseed cake, at 8*l.* ...	6	10 8
		£103	16 9

The average expense of the keep of this lot is about 5*s.* 8*d.* per week, each.

1836.	Lot 3, fed on Turnips and ground corn.		
October 12.	Price of five cattle, at 11*l.*	£55	0 0
24.	10 days' keep on Turnips and straw, at 8*d.*	1	13 4
1837.			
January 1.	17 tons White Globe Turnips, at 8*s.* 4*d.*	7	1 8
April 7.	19 tons 8 cwt. Ruta Baga, at 12*s.* 6*d.* ...	12	2 6
	1 ton 14 cwt. 98 lbs. Bean-meal, or 63 bushels of Beans, at 5*s.*	15	15 0
	9 bushels bruised Oats, at 3*s.* 6*d.* ...	1	11 6
		£93	14 0
June 14.	10 tons 14½ cwt. Ruta Baga at 12*s.* 6*d.* ...	6	14 1
	1 ton 9 cwt. 100 lbs. of Bean meal, or 54 bushels of Beans, at 5*s.*	13	10 0
		£113	8 1

This lot had latterly the rough seeds of oatmeal, as a mixture to the Bean-meal, which are not charged, being worth the price as manure.

Lot No. 4, fed on Distillery Grains and Ground Beans.

October 12.	Price of five cattle	£55	0 0
24.	10 days' keep on Turnips and straw, at 8*d.*	1	13 4
Nov. 7.	3 tons 5 cwt. White Globe Turnip, at 8*s.* 4*d.*	1	7 1
April 7.	72 quarters draff, at 4*s.* 6*d.*	16	4 0
	60 puncheons dreg, at 2*s.* 6*d.*	7	10 9
	1 ton 14 cwt. 62 lbs. Bean-meal, or 62 bushels ground Beans, weighing 62 lbs. per bushel, at 5*s.*	15	10 0
		£96	1 2
	Estimated value at this date, 81*l.* 10*s.*		
June 14.	37½ quarters draff, at 4*s.* 6*d.*	8	8 9
	28 puncheons dreg, at 2*s.* 6*d.*	3	10 0
	19 cwt. 104 lbs. Bean-meal, or 36 bushels ground Beans, weighing 62 lbs. per bushel, at 5*s.*	9	0 0
		£118	3 2

The average expense of the keep of this lot is about 7*s.* 2*d.* per week each beast.

At the commencement of these experiments, the different divisions of cattle had each their places, as well as kinds of food, allotted to them; and those of the trial lot, No. 1, whose feeding was destined to be Turnips only, from being the kind of food which they were formerly accustomed to, made a more immediate improvement than the cattle of the other lots, so much so, indeed, that several of my friends who saw them during this period could not believe that a proper division of the cattle had been made, as this lot was then, about the end of November, 5*l.* better than any of the other lots. By the above statement, it will be observed that the feeding the lot upon half Turnips and oilcakes, was the least expensive mode which was adopted in making the experiments; and that these cattle made the greatest improvement (although, after 10 or 12 days' trial with oilcakes, they were so obstinate in refusing them, that it was necessary to take away their allowance of Turnips for some days, and give them water in their stead, before they were induced to begin.) This was sufficiently proved by the marked difference in value put upon them by the judges appointed to report upon the comparative value of each lot, at the Society's show in April. This continued in rather an increased degree during the remaining time they were here, particularly as contrasted with the trial lot, which was altogether fed upon Turnips, having been estimated by good judges, about the beginning of June, to be worth 40*s.* more each beast than those of the other lot. The improvement of the cattle in lot No. 3 was much retarded by one of their number being naturally of such an unsettled restless disposition, that he had neither time to eat himself, nor would he allow the others to do so, and, although the yard which they occupied was of sufficient size for a greater number, it was not until the turbulent ox was taken away and fed by himself, that the cattle made the improvement which they ought to have done; after that, however, a very perceptible improvement took place, and, by adding a little to their daily allowance of ground Beans, their value when killed, as it appears by the flesher's return, was very different from what it had been when valued comparatively with the other lots at the April show. This untoward circumstance caused a greater expense in the keeping of this lot than would have been otherwise necessary. In the charge against No. 4 it will be observed that keeping upon distillery offal is more expensive than the keeping of lots Nos. 2 and 3 upon half Turnips, these, however, were the produce of the farm, and the prices were fixed by the committee, and high as they are, I could not have purchased Turnips to carry here, unless by giving 4*s.* or 5*s.* advance upon the ton weight; therefore a part of the charge against the distillery offal will require to be set down for manure, and the same ought also to be deducted from the Beans, which are charged at rather a full price. Upon the whole, it is evident by these experiments that feeding with Turnips, as an auxiliary, has been the most advantageous mode of using Turnips, as by the state it is apparent that if the cattle of No. 1 had only been allowed half the quantity of Turnips which they consumed, and had got oilcakes in lieu of the other half, as was given to lot No. 2, the expense of their keeping would have been lessened 4*l.* 13*s.*, and from superior quality their value would have been increased 10*l.*, making together 14*l.* 13*s.*; thus, by bestowing the rest of the Turnips, with the addition of oilcakes, upon other five cattle, the realisation upon the Turnips eaten by lot No. 1 would have been 29*l.* 6*s.* additional to what it has been. These experiments were carried on for two months after the valuation was made at the show in April; as from an over supply in the market, caused by a scarcity of Turnips, these cattle would not then have paid for their keep; but by continuing till June, I have been amply remunerated for all my outlay and trouble, without taking into account the great advantage of the additional and enriched manure of 20 cattle fattening upon the farm, where 10 only could have been kept, had Turnips alone been used for that purpose; and to any person at all acquainted with agriculture, it must be evident that one cart-load of manure made by cattle thus fed, will be at least equal to two if the cattle had got only straw and water.

LIVE WEIGHT OF CATTLE BEFORE BEING TRAVELLED TO GLASGOW.

From the cattle having travelled to Glasgow, their weight has not turned out in the manner it would have done had they been slaughtered nearer home, besides, from a very great dulness taking place in the butcher market there, Mr. William Thomson, who purchased the cattle, found a great difficulty in disposing of the beef so quickly as the time of lifting required, therefore lot No. 1, which was first slaughtered, had an advantage by not being allowed to fall off from being kept after being driven such a distance. In conclusion, I may refer to the great change which has lately taken place in the department of fattening stock. About 50 years ago, the cattle were kept in yards, and had simply straw and water given them. Now, from furrow draining and portable manures, Turnips are almost everywhere grown; and, besides, in every district, other substances are given auxiliary to them. During the past 20 years, perhaps the amount of stock fed in East-Lothian has been quadrupled, and this not arising from the increase of population only or principally, but from a change in the habits of the people as regards the consumption of animal food. In this there is no doubt there may be still very great extension, as, within our knowledge, few of the hinds in East-Lothian taste animal food, except, perhaps, a little pork, and that from pigs fed by themselves. It is to meet the increasing consumption that the efforts of farmers should be directed, and everything ought to be attempted to supply such food at the lowest rate, whether by increasing the amount or improving the quality of Turnips, or by judicious combination of other substances. It is true that, within the past few years, the profits realised by farmers in feeding have not been so great as formerly, or as we had calculated on. There can be no doubt, however, that on this department of farm management much of the success of modern farming must necessarily depend. Hence the importance of our mutual communication of such facts as may tend to improve our present system of feeding stock.

Mr. KENNEDY, Myremill, said: The subject before the meeting for consideration is, "The substances which can be most profitably employed as auxiliary to Turnips in fattening cattle and sheep." I shall merely detain the Society by stating the system I have found most profitable, and which I have pursued for some years. I consider when cattle are put up to fatten on Turnips or any other green food, the first point to be attended to is to place them in stalls or boxes, where they will have sufficient warmth, with good ventilation, and a plentiful supply of pure fresh air, as their facility to fatten will depend very much on the temperature at which they are kept, irrespective of the quality and quantity of their food; if in a cold byre or box, a great amount of the food they consume will be wasted in keeping up the heat of the body, great loss being suffered annually by the tenantry of this country, for want of proper accommodation for their cattle. In all situations, their improvement will be greatly facilitated by giving them artificial food, the different kinds and quantities of which will depend very much on the relative price of the various articles in use, in comparison with their feeding properties. I have always found my cattle thrive better on a small quantity of Turnips than on a large, provided I gave them bulk of other food; a bullock of 7 cwt. would require to get from 60 to 70 lbs of cut Swedish Turnips per day, a larger quantity, in my

opinion, being only lost as bulk, and is not assimilated by the animal, bulk being necessary to enable the digestive process of herbivorous animals to proceed, as without it they cannot ruminate, and rumination is necessary to ensure their thriving and keeping in health. Entertaining this opinion, I have given my feeding stock at the homestead where I live, and where I have conveniences for the purpose, a cooked feed as auxiliary to Turnips, and which I have found a very great economy of them, and which has enabled me to convert a large quantity of the hay and straw of the farm into much more valuable manure, independent of its nutritive qualities, besides keeping an increased quantity of stock. The feed is composed generally of 1 lb. of Linseed, or 2 lbs. of oilcake-meal converted into mucilage, by boiling it in a given quantity of water in large coppers, which is then poured over a mixture of 2 lbs. Bean-meal, 2 lbs. bruised Barley or Oats, with from 10 lbs. to 12 lbs. of hay, and 1 stone of chaff, to which some salt is added, which I consider promotes digestion, and is conducive to health, which being all mixed together, on the floor of the steaming-house, and allowed to lie for two or three hours, when the dry chaff and meal absorb all the mucilage of the Linseed jelly, and the whole is converted into a fine mass, and of which from 16 lbs. to 20 lbs. is given to each animal per day, which they eat greedily, and which they can ruminate. I think I have always been paid in giving food prepared so as to be easily digested, besides preventing a loss in the food in passing through the animal unassimilated. Linseed or oilcake-meal as a source of the fat; and Bean or Pea-meal, Barley or Oats, as the flesh-forming food; with cut and washed Swedish Turnips, straw, or hay chaff, to give bulk, to enable the stomach to perform its functions. I have given oilcake for many years to cattle, on farms where I had no means of preparing food, from 3 lbs. to 10 lbs. per day, according to the size of the animal; until the last two years I had given half Rape-cake (having seen it recommended by Mr. Pusey), and in looking at the analysis, by Prof. Way, of oilcake and Rape-cake, I found the feeding proportions of the one about equal to the other, which induced me to give it a trial. My cattle very soon eat it half-and-half, that is, half oilcake and half Rape-cake, and I am satisfied they improved equally well, with considerably diminished cost of food. My experience in giving artificial food to cattle, is to begin early in the season, and rather give a small quantity the whole time the cattle are feeding than to give a large quantity during the last two or three months, to finish them, as is often done, because in giving a larger quantity of from 6 lbs. to 10 lbs. of any kind of auxiliary food to an animal at once, a great deal of it is lost by not being assimilated. In proof of this opinion it is generally found that cattle, long fed on a moderate allowance of artificial food, kill better than when given a large quantity in a short time. I only feed my cattle three times per day; in feeding oftener they are much disturbed, and do not thrive so well, being kept more on their feet; and, in confirmation of this opinion, it is well known that cows kept in dairies, when they never get out of the house, give more milk always in the morning than the evening, in consequence of being less disturbed during the night. In giving sheep auxiliary food with Turnips, a mixture of oilcake, Rape-cake, and corn, will be found to improve the land and diminish the quantity of Turnips consumed very considerably. A small lot I experimented on some years ago, with stored Turnips put down to them on a field, where they were consuming 12 cart-loads per day, when I commenced to give them ½ lb. of oilcake and corn each per day, which diminished the quantity of Turnips consumed by a half—six carts being quite sufficient for them. I am not disappointed at any time, although not fully paid for auxiliary food given feeding stock, having often, in these times of low prices, to be satisfied with the greatly increased value and amount of the manure made thereby. Before sitting down allow me to observe how much I think the farming interest is indebted to the researches of the chemist, in pointing out to them the amount of feeding properties contained in the different articles employed, a strict adherence to which I have always found to give corresponding results.

(To be continued.)

Miscellaneous.

Smithfield Club Cattle Show.—This popular exhibition will offer increased attraction for visitors this year. The entries of stock very far exceed any previously made in former years, in consequence of which the committee of the Smithfield Club have required the proprietor of the Bazaar to provide the necessary accommodation for nearly 50 more than the usual number of oxen, and a corresponding enlargement of the space occupied by sheep and pigs. The extent of the Bazaar premises has enabled this to be done without interfering with the convenient arrangement of the animals, while the extension will give greater facilities to the increased number of visitors who may fairly be expected to view the exhibition. The list of exhibitors in the cattle classes is again headed by his Royal Highness Prince Albert, the Duke of Rutland, the Earl Spencer, the Earl of Leicester, the Earl of Hardwicke, and several other noblemen entering the lists as competitors. The Duke of Richmond and Mr. Jonas Webb will contribute several pens of sheep, and Mr. Fisher Hobbs and the Earl of Radnor will again contend for [illegible] of excellence in the porcine tribe. In addition to the increased space to be occupied by animals, the agricultural implement galleries have also been greatly enlarged, in order to afford room for the many new and improved machines lately introduced to facilitate the science of husbandry. The committee of the club will meet on Monday next to award the prizes. The exhibition will be thrown open to the public on Tuesday morning, and finally close on the following Friday.—*Daily Paper.*

Notices to Correspondents.

Books: *A Subscriber.* Do you mean books relating to agricultural labour, or any books suitable for a lending library in the country? In the latter case, all Knight's Shilling Volumes, Effingham Wilson's little books on Emigration, Miss Martineau's Tales illustrative of Political Economy, a number of books published by the Christian Knowledge Society, &c., are suitable. A book just published, "J. Sillet on Fork Husbandry," is a capital book to put into the hands of labourers. It is the history of personal and successful labour as a small farmer.

Cochin China Fowls: *Elizabeth.* Mr. Baker is right in stating that the presence or absence of the fifth toe in these birds is quite immaterial.

Grass: *Este.* We would excavate the patches of loam and spread the produce. Guano on the poor part, and salt and lime on the rich, will correct both; 3 cwt. of the former per acre, sown in February; 100 bushels of the latter per acre, slaked with brine, spread now or in early spring.

Harlech: *R B.* We know the district well; and when the spot (probably the same as you name), was last seen, it occurred to us, that the best agricultural implement that could be applied was Fire. We would plough and burn, and plough and burn mercilessly, and if possible get some clay to dress the land with, and then plough before winter, and get Rape or Grass seed to grow on it.

Newly Broken Land subject to Worms: *Young Farmer.* We suppose the best mode of treating it is to keep it stirred at intervals during winter. A heavy dressing of lime might do good.—Sow Mustard and eat off with sheep. The trampling of the land is a method of destroying them.

Pigeons: *P T O.* For these you are, at present, referred to "The Dovecote and the Aviary," announced by Mr. Murray.

Pumps: *Agricola.* Judging from the exhibition yards of the English Agricultural Society, we should suppose Read's, of the Circus, Regent-street, to be the likeliest place.

Ruptured Stomach: *J P A.* The case in its early stage was probably distension of the stomach, either with gas or food, caused and attended with an interruption of the functions of this viscus. If flatulency was the cause there are many ways in which it might have been relieved; chioride of lime, sulphuric ether, water of ammonia, with tincture of opium, are suitable remedies. If food was the cause of distension, oily purgatives, with opium, as before, would be appropriate. Of course, after the rupture took place, no treatment could avail. We do not consider the "Bots" to have been the cause of the disorder; their presence is by no means uncommon. It was the violent action of the stomach in seeking to get relieved which caused the rupture. *W. C. S.*

Markets.

COVENT GARDEN, Dec. 7.

Vegetables are still abundantly supplied. Hothouse Grapes and Pine-apples are quite equal to the demand. Oranges and Lemons are plentiful. Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. The latter are rather dearer. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Fuchsias, Mignonette, Tulips, Dahlias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Pommegranates, each, 3d to 6d
Grapes, hothouse, p. lb., 3s to 6s	Almonds, per peck, 6s

COAL MARKET.—Friday, Dec. 6.

Hollywell, 15s. 6d.; Eden Main, 15s. 6d.; Wallsend Haswell, 17s.; Wallsend Hetton, 16s. 9d.; Wallsend Tees, 16s. 6d.—Ships at market, 30.

POTATOES.—Southwark, Dec. 2.

The Committee report that the supply coastwise during the last week has been again limited, which enabled salesmen in some few instances to realise a little more than our last week's quotations of Scotch. In other sorts there is no alteration. The following are this day's quotations:—York Regents, per ton, 80s. to 90s.; Scotch do., 60s. to 75s.; Wisbeach do., 65s. to 75s.; French whites, 65s. to 70s.

SMITHFIELD, Monday, Dec. 2.

We have a very large supply of Beasts, and although there is a more cheerful trade, yet, owing to the number being excessive, many remain unsold. However, the choice qualities are nearly all disposed of, and we are still enabled to quote 3s. 10d. for them; but some inferior descriptions are sold at late rates. The number of Sheep is small, and late prices are fully supported, indeed, in a few instances rather more money is obtained. Trade is brisk for Calves, owing to a shorter supply. From Holland and Germany we have 1178 Beasts, 2830 Sheep, and 152 Calves; from Scotland, 400 Beasts; from Norfolk and Suffolk, 100; and 3100 from the northern and midland counties.

Per st. of 8 lbs.—	s d	s d	Per st. of 8 lbs.—	s d	s d

Ditto Shorn	—	...	Lambs	—	...
			Calves	3 0	— 4 2
			Pigs	3 0	— 4 0

Beasts, 5058; Sheep and Lambs, 24,190; Calves, 180; Pigs, 410.

Friday, Dec. 6.

We have a large supply of Beasts and a very small demand; consequently, prices are lower; a great many remain unsold. The number of Sheep is considerable for the time of year; trade is very slow, at a reduction of fully 2d. per 8 lbs. Calves are more plentiful; prices are lower, and several foreign ones remain unsold. From Holland and Germany there are 377 Beasts, 520 Sheep, 214 Calves, and 20 Pigs; 80 Beasts from Scotland, and 90 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3 6	to 3 8	Best Long-wools .	3 4	to 3 6

Beasts, 1109; Sheep and Lambs, 4500; Calves, 352; Pigs, 425.

MARK LANE.

Monday, Dec. 2.—The supply of English Wheat to this morning's market was small, and disposed of on terms barely equal to those of this day se'nnight. Foreign was in more general demand, but holders being very firm the extent of sales was limited.—Fine malting and good distiller's Barley support our quotations, but secondary descriptions are difficult of disposal, even at rather lower prices.—Beans remain as last quoted.—White Peas must be written 1s. per qr. cheaper, in other qualities there is no alteration.—The demand for Oats is less active than last week, and the terms in favour of the buyers.

Friday, Dec. 6.—The arrivals of all grain since Monday have been moderate, and that day's prices for Wheat are supported.—Barley is also fully as dear.—We observe no alteration in the value of Beans or Peas, but the latter are much neglected.—Oats are in good demand, and the turn dearer.—There has been a slow trade for French Flour during the week, and less money in some instances accepted, as also for some country marks.

Liverpool, Friday, Nov. 29.—Owing to adverse winds, the fresh arrivals of grain from any quarter are altogether trivial. Although at our market to-day we experienced a slow languid sale for Wheat of all descriptions, holders remained firm, and steadily refusing to accept lower prices, our quotations of Tuesday remain unvaried. States and Canadian Flour met a fair inquiry. Malting Barley and Malt, upon a moderate demand, remained steady in value, and grinding Barley was a shade dearer. In Beans and Peas no change was apparent. Oats maintained the advance above stated, but sold less readily to-day. Oatmeal improved 3d. per load. Indian Corn was held with increasing confidence, and supported the preceding amendment.——Tuesday, Dec. 3.—At our market this morning millers were cautious and unwilling buyers, and the Wheat trade in all its bearings was dull and uninteresting, and English, Irish, and foreign Wheats were decidedly easier to purchase. Barley commanding more attention, malting as well as grinding samples improved 6d. to 1s. per qr. Beans and Peas, upon a moderate demand, remained stationary in value. Prime mealing Oats attracted a fair inquiry, and from actual scarcity were the turn dearer; other descriptions moving slowly at previous rates. Oatmeal maintained Friday's amendment. Indian Corn has fully supported the advance of last week, being 3d. to 6d. per qr. higher on this day se'nnight.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.

2-inch „ extra strong „ ...	12 „	9 „
1½-inch „ light „ ...	8 „	6 „
1½-inch „ strong „ ...	10 „	8 „
1½-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

9 inches wide	3*d.* per yard.	30 inches wide	7½*d.* per yard.

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

SACRED HARMONIC SOCIETY — EXETER HALL — CONDUCTOR, Mr. COSTA. — On FRIDAY, December 13th, will be repeated Handel's Oratorio MESSIAH. Vocalists—Miss Birch, Miss Dolby, Mr. Lockey, and Mr. H. Phillips, with Orchestra (including 16 double basses) of upwards of 700 performers. Tickets 3*s.*, 5*s.*, and 10*s.* 6*d.* each, at the Society's sole Office, No. 6, Exeter Hall, or of Mr. BOWLEY, 58, Charing Cross.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S" adopted by some houses.

"NORTON'S"

CAMOMILE PILLS are confidently recommended as a simple but certain Remedy, to all who suffer from Indigestion, Sick Headache, Bilious and Liver Complaints, Heartburn, and Acidity of the Stomach, Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, Costiveness, &c. They act as a powerful tonic and gentle aperient; are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use. Sold in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* each, in every town in the kingdom.

CAUTION.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase an imitation.

GOLDSMITH'S POETICAL WORKS. Edited by BOLTON CORNEY. With Engravings on Wood, from Designs by Members of the Etching Club.

"That edition of the *Poetical Works* which had the benefit of Mr. Bolton Corney's care and judgment in its preparation; and which, apart from the grace and beauty of the illustrations contributed to it by the Etching Club, is by far the most correct and careful of the existing editions of Goldsmith's poetry."—*Forster's Life of Goldsmith*, page 699.

London: LONGMAN, BROWN, GREEN, and LONGMANS;

Of whom may be had, uniform with the above in size and price.

THOMSON'S SEASONS. Edited by BOLTON CORNEY. With Wood Engravings by Members of the Etching Club.

SIR JOHN HERSCHEL.

New Edition, in 8vo, with Plates and Woodcuts, 18*s.* cloth,

OUTLINES OF ASTRONOMY. By Sir JOHN F. W. HERSCHEL, Bart., &c. &c. &c.

"We take our leave of this remarkable work, which we hold to be, beyond a doubt, the most remarkable of the works in which the laws of astronomy and the appearances of the heavens are described to those who are not mathematicians nor observers, and recal to those who are."—*Athenæum.*

"In the earlier portions more especially much new matter is introduced. . . . To all intents and purposes, indeed, *Outlines of Astronomy* must be considered a new work—so careful has been the revision, correction, and remodelling of the original treatise; so numerous the additions to it; and so important the new trains of inquiry opened up."—*Examiner.*

London: LONGMAN, BROWN, GREEN, and LONGMANS; and JOHN TAYLOR.

PRICE FOURPENCE, OF ANY BOOKSELLER.

CONTENTS OF THE NUMBER FOR SATURDAY LAST, NOVEMBER 30, OF

London: HOULSTON and STONEMAN; and of Booksellers everywhere. Price 2*d.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. The GENERAL MEETING of the Society will be held on Saturday, the 14th of December, at 11 o'clock in the forenoon.—By Order of the Council,

London, 6th Nov., 1850. JAMES HUDSON, Secretary.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The Council of the Royal Agricultural College, at Cirencester, propose, after the ensuing Christmas Vacation, to receive within the walls of the College Students who, at the date of their admission, do not exceed 16 years of age, though they will not necessarily be removed on reaching that age.

Students between the ages of 16 and 20 may be received in a commodious Boarding House, in Cirencester, under the superintendence of a resident Professor or Master. Out-Students above the age of 20 will be admitted on the same footing as heretofore.

TERMS, PER ANNUM,

TO BE PAID HALF-YEARLY, IN ADVANCE.

Pupils under fourteen years of age	45 Guineas.
Ditto above fourteen	55 „
For a separate sleeping apartment, if it be required, an additional	10 „
For a share in a private study, of which there are but a limited number	5 „
Pupils in the Boarding House	80 „
Out-Students	£40

Excepting in the case of Out-Students, these terms will include everything but medical attendance, books, and writing materials.

The Religious instruction and moral discipline of the whole of the Students will be most carefully attended to, as the groundwork of all education.

The Lectures in Chemistry—the Veterinary Art—Geology—Botany and Zoology, hitherto so ably presided over and conducted, will be continued, for the especial benefit of the elder Students.

Instruction—by competent Masters—in Arithmetic, Algebra, Mathematics, and Natural Philosophy, Surveying and Mensuration, in History and Geography—will be offered to every Student; while those, whose Parents desire it, will be instructed in Modern Languages and Classics.

Agriculture will be taught on the Farm—where the Students will be led to compare what they have learnt in the Lecture Room with the practical system of cultivation which they will see carried out.

They will also have the opportunity of becoming thoroughly acquainted with the breeding, rearing, feeding, and general management of all kinds of Stock—with the preparation of Corn for the market—and with the application of Steam Machinery to Farming purposes—and also with the best system of Farm Accounts.

It will be seen from the above that the Royal Agricultural College offers decided advantages to those who wish to qualify their Sons, either for the pursuit of Agriculture as a profession, or for becoming Land Agents or Stewards; also to persons of any age, who, intending to emigrate, desire to obtain some knowledge of Agriculture before leaving England; moreover, no slight inducements are held out to all parents, who are desirous of procuring for their Sons such an Education as will qualify them for any calling or profession, at as moderate a cost as is compatible with the advantages offered, and with the liberal scale on which the comfort of Students will be attended to and promoted in every particular.

For further information, &c., application may be made to the Principal, The Rev. JOHN SAXER HAYGARTH,

Dec. 7. Rodmarton, Cirencester.

EXHIBITION, 1851.—Interior of the Building in Hyde Park, as approved by Her Majesty's Commissioners. The authentic View of the Interior, showing the space allotted to the Exhibitors, and the internal appearance, arrangements and fittings of the Building, is now ready, on Steel, nearly [illegible] in length, with description, and classification of the articles exhibited. Price 3*d.* Post-free, on Roller, 10 stamps. The authentic View of the Exterior, as approved by the Commissioners, same size and price.—G. BERGER, Holywell-Strand, and all Booksellers. Royal Exhibition Note [illegible], 1*s.* 6*d.* per Quire; 20*s.* per Ream.

SOUTHAMPTON.—EXTENSIVE SALE OF NURSERY STOCK AND SEEDS.

TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS have received instructions to submit for unreserved Sale by Auction, on the premises, at Hill and Sidford and Southampton Nurseries, on MONDAY, Dec. 16, 1850, and following days, at 11 o'clock, precisely, each day, in consequence of the number of lots, the very valuable and extensive Stock of Fruit and Forest Trees, Evergreens, Coniferæ, American Plants; Agricultural, Garden, and Flower Seeds; Bulbs, Roots, &c., and every other article in the Trade, for which "Page's Nurseries" have been so highly celebrated; also a four-wheeled Chaise, Carts and Horses, Utensils, and Implements of Trade. May be viewed, and Catalogues had prior to the Sale, 1s. each; returnable to purchasers; on the premises, 57, above Bar, Southampton; of the principal Seedsmen in London; at the Inns in the neighbourhood; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B.—The valuable Freehold Premises, comprising a capital Dwelling-house in the above Bar-street, Southampton, with an extensive range of Green-houses, Stores, Out-buildings, and Nursery-grounds, in the rear extending to Portland-terrace, are for Sale by private contract. Particulars may be had on application to Mr. William Brooks, Accountant and Estate Agent, 24, Portland-street, Southampton.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, December 13, a first-rate Collection of DUTCH BULBS, consisting of the finest Double and Single Hyacinths, Narcissus, Jonquils, Crocus, Tulips, Gladiolus, &c.; Standard and Dwarf Roses, comprising Hybrid Perpetuals, Bourbons, Chinas, &c.; with a selected assortment of American Plants and Ornamental Trees, &c. May be viewed the morning of Sale.—Catalogues to be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

FINAL SALE.—TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith to submit to an unreserved Sale by Auction on the premises, Dalston Nursery, Dalston, Middlesex, on WEDNESDAY, December 11th, 1850, and following day, at 11 for 12 o'clock precisely, the remaining valuable NURSERY STOCK, consisting of Evergreens, Ornamental Trees, &c. A capital Propagating House, Hot-water Pipe, Slate Tank, Boiler, &c.; the erection of three large Sheds, with Tiles, Bricks, Woodwork, &c.; also a first-rate Van, Iron Roller, Carpenter's Bench; Ladders, Wheelbarrows, Handbarrows, Water Pots, Tanks, Propagating Glasses, Hand Lights, Matted Lights, &c.; together with upwards of 100 sacks of Ash-leaved Kidney, York Regents, Seedling, and other Potatoes; with a quantity of Flower-pots, Rotten Dung, Garden Tools, and sundry effects.—May be viewed, and Catalogues had, prior to the Sale, on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CAMELLIAS, AZALEAS, &c.

MR. J. C. STEVENS will Sell by Auction, without reserve, at his Great Room, 38, King-street, Covent-garden, on THURSDAY, the 12th inst., at 12 o'clock, 300 CAMELLIAS, from 3 to 6 feet, well set with bloom, and comprising all the best sorts; 500 AZALEAS, in 32 and 48-sized pots, and a few Plants of Erica Willmoreana.—May be viewed on Wednesday, and Catalogues had.

THE BIRMINGHAM CATTLE SHOW.

THE GREAT EXHIBITION of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will take place in the BINGLEY EXHIBITION HALL, Broad-street, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, in next week, the 10th, 11th, 12th, and 13th, of December.

The PRIVATE VIEW on TUESDAY.

Admission to Non-Subscribers—On Tuesday, 2s. 6d.; and on Wednesday, Thursday, and Friday, One Shilling. The Doors will be opened at Ten o'clock each morning.

☞ For Special Trains to the BIRMINGHAM SHOW, see the advertisements of the respective Railway Companies.

SMITHFIELD CLUB CATTLE SHOW.—Stand "81."—10th 11th, 12th, and 13th December.

CROGGON AND CO., of 2, Dowgate-hill, London, will exhibit MODELS OF COTTAGE and BARN, made to Scale, illustrating the Economy of their PATENT ASPHALTE ROOFING FELT—Price 1d. per square foot.

Also MODEL OF BOILER covered with their Non-conducting Felt, thereby saving 25 per cent. in consumption of Fuel. Samples sent by Post.

FOR PORT LYTTELTON, CANTERBURY SETTLEMENT, AND OTHER PORTS IN NEW ZEALAND.

THE first-class Passenger Ship, DUKE OF BRONTE, 500 Tons register, lying in the East India Docks, chartered and provisioned by the Canterbury Association, to sail on the 8th of January. Rates of Passage—Chief Cabin (a whole cabin between decks), 42l.; Fore Cabin, 25l.; Steerage, 16l.

For freight, passage, or further information, apply to FILBY and Co., 157, Fenchurch-street; J. STAYNER, 110, Fenchurch-street; or to FREDERICK YOUNG, Manager of Shipping for the Canterbury Association, 74, Cornhill.

YARMOUTH BLOATERS.—GENUINE AND OF THE FINEST QUALITY.

Yarmouth has for centuries been justly celebrated for its well-known "Yarmouth Bloaters," the delicacy of which, when obtained in their genuine state, requires no comment. Such an opportunity is now offered; and they can be forwarded to any part of the kingdom (on receipt of a post-office order), at 10s. per 100, or 6s. per 50 (package included).—All orders to be addressed to Mr. FREDERICK BROUGHTON YOUELL, Church-square, Great Yarmouth.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2s. 9d. per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

RENDLE'S PRICE CURRENT & GARDEN DIRECTORY.

IS JUST PUBLISHED,

Price *Fivepence*, of all Booksellers, or *Sixpence, Stamped*, free by post, of all News Agents.

It contains a Descriptive Catalogue of the best CULINARY VEGETABLES *in cultivation, with the time of sowing, height, and other useful particulars; also a Description of all the best sorts of* AGRICULTURAL SEEDS, *as well as a most comprehensive list of the choicest and best* FLOWER SEEDS, *giving the height, colour, hardiness, and duration of each kind.*

It contains also a COMPLETE CALENDAR OF OPERATIONS *in the Kitchen Garden for every month throughout the year, as well as a* GARDEN ALMANAC, *with a short description of Mr. Paxton's* "CRYSTAL PALACE," *the Victoria Regia or Gigantic Water Lily, the Botanic Gardens, Plymouth, with other information relating to Gardens and Gardening Operations.*

COPIES CAN ALSO BE OBTAINED FROM
WILLIAM E. RENDLE AND CO.,
Seed Merchants, Plymouth,
In exchange for Six Postage Stamps.

A *Copy of our* PRICE CURRENT AND GARDEN DIRECTORY *was forwarded to* HIS ROYAL HIGHNESS PRINCE ALBERT, *and by return of post we received a complimentary letter, conveying His Royal Highness's "best thanks." Dated Windsor Castle, November* 20, 1850.

The following letter has just been received from Mr. James Barnes, the celebrated and well-known Gardener at Lady Rolle's, Bicton Gardens, Sidmouth, Devon:—

"Bicton Gardens, Sidmouth, Nov. 30, 1850.

"Gentlemen,—I beg to acknowledge the receipt of your 'PRICE CURRENT AND GARDEN DIRECTORY,' for which I beg to return you my best thanks. I have read it with much interest, and am of opinion that it will be found not only interesting, but very useful to a large majority of the gardening world.—I am, Gentlemen, respectfully, your obedient servant,

"To Messrs. W. E. Rendle & Co." "JAMES BARNES."

The following letter has also been received from Mr. Robert Errington, Gardener to Sir P. Egerton, Bart., Oulton Park:—

"Oulton Park, Tarporley, Nov. 21, 1850.

"Gentlemen,—I am much obliged by the receipt of your very interesting and useful annual—'PRICE CURRENT AND GARDEN DIRECTORY.' This is just how things should be. I have long anticipated the period when such things must take place, for we may rest assured that it is at once the duty and interest of the tradesmen to do all in his power to please his customer, and in no profession is this more requisite than in that of the Nursery and Seedsman. I have looked carefully over it, and think it does you great credit, both in the general arrangements and the very creditable degree of accuracy to be found in the details.

"I remain, Gentlemen, your most obedient servant,

"ROBERT ERRINGTON."

The PRICE CURRENT has also been reviewed in the following newspapers and magazines, in the whole of which it has been spoken very favourably of:—

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

Teignmouth Gazette.
Besley's Devonshire Chronicle.
Portsmouth Times and Naval Gazette.
The Plymouth Times.

J. E. DOWSON, 123, OXFORD-STREET

(FIVE DOORS WEST OF REGENT-CIRCUS),

Is the Sole Manufacturer of

THE PRIZE STOVE OF 1850,

Now Exhibiting in the Model Room of

THE SOCIETY OF ARTS,

John-street, Adelphi, London;

AND IS UNQUESTIONABLY

THE CHEAPEST STOVE IN THE MARKET.

IT HAS ALREADY BEEN EXTENSIVELY ADOPTED, AND IS KNOWN AS

CUNDY'S PATENT IMPROVED OPEN FIRE-PLACE, WARM AIR, VENTILATING STOVE.

IT IS ADMIRABLY ADAPTED TO

WARM AND VENTILATE CHURCHES, CHAPELS, VESTRIES, SCHOOL-ROOMS,

AND OTHER PUBLIC PLACES, HALLS, DINING-ROOMS, LIBRARIES, CLUB-ROOMS, &c.

THE ADVANTAGES OF THIS STOVE ARE—

1. That it combines the CHEERFULNESS of an open fire with the comfort of a constant supply of Fresh Atmospheric Air of a genial temperature.

2. That it consumes the IMPURE air of a room and replaces it by the admission of PURE air from without.

3. That it preserves the BALANCE between the CONSUMPTION of the impure and the ADMISSION of pure air so accurately that it effectually prevents BLASTS of cold air through crevices in doors and windows.

4. That it never raises the temperature of the air, which is warmed by passing through the stove, so high as to burn it, or impart to it any UNPLEASANT SMELL OR INJURIOUS PROPERTIES.

5. That it imparts so large a proportion of its heat to the air in its passage into the room through it, that the SMOKE FLUE can never get so heated as to endanger the building, or to add to the risk in insuring.

6. That as nearly all the heat produced by the fire passes with the air into the room, and very little up the flue, it obviously economises the fuel.

The ADVANTAGES of CUNDY'S PATENT STOVES, therefore, are CHEERFULNESS and COMFORT, PURITY and WARMTH of the Air, the Absence of any Noxious Properties, FREEDOM from DANGER, and ECONOMY of FUEL.

Letter from the Rev. MATTHEW O'BRIEN (Professor of Natural Philosophy and Astronomy), M.A., F.R.S., &c., King's College.

I beg to certify that one of Mr. Cundy's Patent Stoves was put up in my Lecture Room, at King's College, last year, in place of a Common Stove (of Arnott's construction, I believe). I have no hesitation in saying, from actual experience, that Mr. Cundy's Stove is far superior both in producing warmth over the whole room, and in promoting ventilation, without disagreeable currents of air, or close smell.

MATTHEW OB'RIEN.

From GEORGE HITCHCOCK and ROGERS, St. Paul's Churchyard.

St. Paul's Churchyard, March 7, 1850.

Dear Sir,—We have never had occasion to regret the substitution of your excellent Stoves for the hot-water apparatus with which our establishment was previously heated; all our customers seem delighted with the change.

The improved ventilation produced by them—the entire freedom from that smell of iron so common to most other stoves, and the agreeable sight of the fire—render them most desirable for such establishments as ours.

We are, dear Sir, yours truly,

GEORGE HITCHCOCK AND Co.

The STOVES may be obtained of the Sole Manufacturer, J. E. DOWSON, 123, Oxford-street (five doors west of Regent-circus), where a Stove is in constant operation. They may also be seen at Messrs. HITCHCOCK and ROGERS, St. Paul's Churchyard; and in the Model Room of the Society of Arts, Adelphi; from which Society Mr. CUNDY, on the 22d July, 1850, received their large SILVER MEDAL for the invention.

NEW WORK ON CATTLE, &c.

This day, price 8s. 6d., or by Post 4s. The

BREEDING AND ECONOMY OF LIVE STOCK, being the Results of Forty Years' Practical Experience in the Management and Disposal of Cattle, Horses, Sheep, and Pigs. By JAMES DICKSON, Cattle Dealer.

Edinburgh: A. C. BLACK. London: LONGMAN & Co.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.
American Nursery, Bagshot, Surrey.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.
Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Dec. 14.

CARTER'S CATALOGUE OF SEEDS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, announces the speedy appearance of his new CATALOGUE FOR 1851, which will be forwarded, gratis and prepaid, on application by post or otherwise. He begs leave to state that the Floricultural section comprises, as usual, the Scientific and English Name of each plant, the Linnean Class and Order, and Natural Order to which it belongs; its hardiness, duration, time of flowering, and colour of the flowers, and other necessary information. The collection of Flower Seeds will comprise several splendid novelties.

H. LANE AND SON, Great Berkhamsted, Herts, will send their NEW CATALOGUE OF ROSES to applicants, by their inclosing two penny stamps. Those who are about Planting Pleasure Grounds, &c., should inspect H. L. and Son's Nurseries (about 50 acres), as they have a fine healthy stock of some thousands of Cedrus Deodara, 2 to 4 feet; Araucaria, 2 to 3 feet; Abies Douglasii, from seed, 4 to 5 feet, with all the leading Pinus. Rhododendrons, all the hardy varieties, from white to crimson, growing in loam, from which they remove readily (also the hybrids of Sinensis—greenhouse varieties); Azaleas, best Ghent, with a general collection of Trees and Shrubs, both for the Pleasure Ground and Park; also of Fruits, Catalogues of which may be had by inclosing two penny stamps.
The Stock of Plants at these Nurseries are kept constantly removed, to ensure success, and not drawn up, to be sold at a price to deceive the public.
Double Camellias and greenhouse Azaleas 1 foot to 4 feet.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

"CEDRUS DEODARA" AND "CUPRESSUS TORULOSA ELEGANTISSIMA."

WM. MAULE AND SONS are now prepared to offer, from their large supplies of CEDRUS DEODARA of various sizes, many thousands of fine specimen plants (grown from seed constantly in the open ground and in pots) measuring 3 feet and upwards, unusually fine and bushy, with good leaders, at 60*s.* per dozen; also many thousands of fine plants of CUPRESSUS TORULOSA; the hardy variety Elegantissima in pots, upwards of 2 and 3 feet, at 50*s.* and 75*s.* per hundred; they also abound with good supplies of the Himalaya Coniferæ generally, together with a large Stock of Scarlet Crimson Himalaya and other hardy Rhododendrons, prices for which will be forwarded on application.
N.B. W. M. and Sons' Lists of prices for Fruit, Forest, Evergreen, and other Trees and Shrubs required at the present planting season, are now ready for distribution, and will be forwarded on application.
References expected from unknown correspondents.
Stapleton-road Nurseries, Bristol.

Our "PRICE CURRENT AND GARDEN DIRECTORY" *is now ready, and contains a Descriptive Catalogue of all the best kinds of* KITCHEN GARDEN, AGRICULTURAL, *and* FLOWER SEEDS, *with a complete* CALENDAR OF OPERATIONS *for every month in the year, and a* GARDEN ALMANAC.
The present edition will be found to be very superior to the Catalogue sent out by us last year, and will be of much service to all who have gardens.
Price *Fivepence*, to be had of all Booksellers, or *Sixpence* stamped, to go free by post. To be obtained of every newsagent who supplies the *Gardeners' Chronicle;* through Messrs. Bradbury and Evans, Publishers, Whitefriars, London; or from WILLIAM E. RENDLE and CO., Seed Merchants, Plymouth.
Send six penny stamps, and a copy will be sent by return of post. This amount will be returned if desired to all purchasers.
*** *This Catalogue is stamped as a Newspaper, and contains 24 folio pages, being the same size as the* "Gardeners' Chronicle and Agricultural Gazette," *including the Newspaper portion.*

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.
A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.
Our Foreign Bulbs have arrived in fine condition.
Seed and Horticultural Establishment, Sudbury, Suffolk.

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS, all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.
For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes, Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.
Exotic Nursery, King's-road, Chelsea, London.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

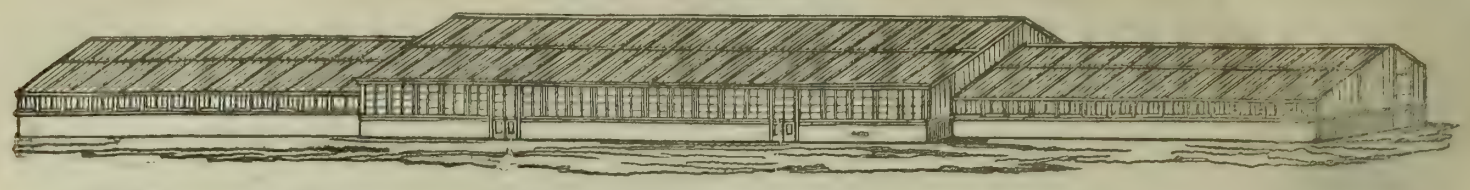
GREAT SALE OF NURSERY PLANTS.

PETER BOOTH, NURSERYMAN, Falkirk, is selling off, at his extensive Nursery Grounds, a very large stock of transplanted LARCH, SCOTCH, and SPRUCE FIR, plants of strong and smaller sizes, including Seedlings, with a great variety of all the other kinds of Forest Trees, Shrubs, &c., generally grown in large Nurseries, of most excellent quality, and at prices much reduced.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.
E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.
Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.
KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.
True BATH COS LETTUCE SEED, 1*s.* per packet.
Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.
ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.
WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.
The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.
Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street Without.
Dixon v. *Bessell.—Alderman Wilson said,* "*It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three,*" *and fined the defendant* 60*l.*, *and* 10*l. costs, for an infringement of the Registered design.—Oct.* 1, 1850.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.
ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.



SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.
NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.
Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.
Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,
Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalized, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

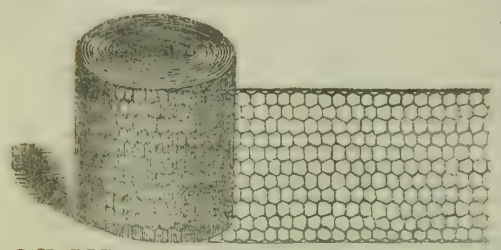
BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.



[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

EASTERN COUNTIES RAILWAY. CHRISTMAS TICKETS.—Return Tickets issued on the 23d, 24th, and 25th inst., will be available for the Return Journey any day up to and including Sunday the 29th. The Trains will run on Christmas day as on Sundays. By Order, C. P. Roney, Secretary.—Bishopsgate Station, Dec. 6th, 1850.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG and COMPANY (late W. and C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

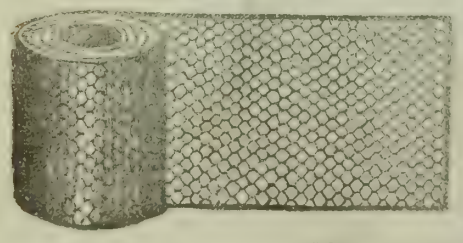
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

Prices.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15	0
Do. of 100 yards, 24 ins. wide	.. ..	5 0	0
Do. of 100 yards, 30 ins. wide	.. ..	6 5	0
Do. of 100 yards, 36 ins. wide	.. ..	7 10	0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. Young and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. Young & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅛-inch ,, strong ,,	...	10 ,,	8 ,,
1⅛-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

RHODODENDRONS and AMERICAN PLANTS.—An unlimited supply always on sale, at the low scale of prices quoted, delivered in London, if ordered in quantity, free of carriage.

RHODODENDRON PONTICUM, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, very fine, fit for planting out for cover, 20*s.* to 40*s.* per 100; 4 to 6 feet, single stems, adapted for working the beautiful new scarlet and other rare species, 50*s.* per 100.

SCARLET RHODODENDRONS, of the finest varieties, 18*s.* per doz., on their own roots.

WHITE RHODODENDRONS, 18*s.* per doz.

KALMIA LATIFOLIA, 6 to 9 inches, 25*s.* per 100; 1½ to 2 feet, blooming, 12*s.* per doz.

Dwarf ROSE Stocks, fit for working, 8*s.* per 100.

Single CAMELLIA Stocks, fit for working, 42*s.* to 50*s.* p. 100.

PINUS (Abies) Douglasii (from seed), 60*s.* per doz., fine plants; 1½ foot Scotch Fir, 2 years seedling (very fine), 2*s.* per 1000.

ARBUTUS, 12 to 15 inches, fine, 25*s.* per 100; 6 inches, 8*s.* per 100.

LAURESTINE, two sorts, 8*s.* per 100, bedded, 1 foot.

TREE ROSES of the most esteemed kinds, 12*s.* to 18*s.* p. doz.

A large and fine Stock of the true "Durmast" English OAK, transplanted, 3 to 5 feet, 40*s.* to 60*s.* per 1000. With every description of Fruit and Ornamental Trees.—For Catalogues and prices apply to W. Rogers, Nurseryman and Contracting Planter, Red Lodge, near Southampton.

METROPOLITAN SEED WAREHOUSE, No. 107, St. John-street, West Smithfield, London,

JAMES G. RENWICK respectfully informs his Customers throughout the Country, that his Stocks of Culinary Vegetable Seeds, of this year's growth, have now been gathered in, and in prime condition.—Catalogues to be had as usual, on application. J. G. R. takes this opportunity of reminding those of his friends, who last year were too late in ordering HINE'S PARAGON EARLY PEAS, that the supply this season is still but limited, and would therefore recommend early applications. Price per bushel, 20*s.*; per peck, 6*s.*

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GLASS FOR CONSERVATORIES, &c.

HETLEY and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

CHRISTMAS CATTLE SHOW, BAKER STREET.

READ'S IMPLEMENTS (STAND, No. 146), Patent Subsoil Pulverizer, Patent Injecting Instruments for Cattle &c., Improved hollow Probangs for relieving Hoven or Choked Bullocks, Sheep, Calves, &c. &c.; New Patent Garden Engines, Machines, and Syringes of every description, upon the most improved principles.—Manufactured only by the Patentee, 35, Regent Circus, London.

☞ Adams's Patent Steel Corn Mill, &c. &c.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6*d.* per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.

Price's Patent Candle Company, Belmont, Vauxhall.

WIRE FENCING, PAINTED.—An effectual fence against hares, rabbits, sheep, cats, dogs, deer, &c., also for enclosing pheasants, fowls, &c., for heightening existing walls, fences, &c., as a protection against petty thieves;—15 inches high, 3*d.* per yard; 18 inches, 3½*d.*; 2 feet, 4½*d.*; 3 feet, 6¾*d.*; 4 feet, 9*d.*; and 6 feet, 1*s.* per yard; less than 2-inch mesh. Being worked in oil it will not rust when painted, and will last twice as long before it requires repainting than any other kind of wirework that is made. Also sparrow-proof wirework, 2*d.* per square foot; wirework, 4-inch mesh, ½*d.* per square foot. Wirework to order. Numerous testimonials of approval.—R. Richardson, 21, Tonbridge-place, New-road, London.

SUBSTITUTE FOR GARDEN MATS, TARPAULINGS, &c.—WATERPROOF TRANSPARENT SHEETING, for protecting from frost Greenhouses, Pits, Frames, Plants, &c., 1*s.* per yard, 2 yards wide; Ditto of Stout Canvas, 1*s.* per square yard; Patent Asphalte Felt, 1*d.* per square foot, for Roofing, &c.; Waggon and Cart Cloths, dressed with India-rubber, 2*s.* per square yard; Driving Aprons, 12*s.*; Horses' Loin Cloths, 7*s.*; very large Driving Capes, 3*s.*—R. Richardson, 21, Tonbridge-place, New-road. N.B. 3000 London Police Capes, 18*s.* per dozen, for Labourers and Farm-servants.

RABBIT NETS, SHEEP NETS, FISHING NETS.—Long Hare and Rabbit Nets, on Cords, 50 to 100 yards long, for catching Rabbits, shooting, &c, dipped in Kyan's Preparation to prevent decay. Strong New Zealand Cord, or Cocoa-nut fibre Sheep Nets, 4½*d.* per yard, 4 feet wide. All kinds of Fishing Nets, for Home Use or Exportation, made by Machinery,

R. Richardson, 21, Tonbridge-place, New-road, London.

WATERPROOF CAPES AND TARPAULINGS.—Large Capes, to effectually protect a man from wet while stooping down, 3*s.* each; Coats, 7*s.* 6*d.*; Driving Aprons, with straps, 12*s.*; Horses' Loin Cloths, 7*s.*; Tarpaulings, the size for a miller's cart, 20*s.*; for a miller's 4-wheeled waggon, 26*s.* 8*d.*, or made up any size at 2*s.* per square yard.—R. Richardson, 21, Tonbridge-place, New-road, London.

N.B. Three Thousand London Police Capes, fresh dressed, 18*s.* per dozen, for farm servants and labourers.

GEORGE BASSIL'S PHEASANTRY, Wood Farm, Hemel Hempstead, Herts, within one mile of the Boxmoor Station, on the London and North-Western Railway. G. B. respectfully invites inspection and early orders. His stock this year consists of upwards of 500, so that he will be able to supply almost any quantity of Tame Bred Pheasants or Pheasants' Eggs in the spring.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, Lea and Perrins, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "Lea and Perrins" are upon the label and patent cap of the bottle.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of John Willis accompanies each packet.

THE HUMAN HAIR.—Of the numerous compounds constantly announced for promoting the growth or reproduction of the human hair, few survive, even in name, beyond a very limited period, whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The unprecedented success of this discovery, either in preserving the Hair in its original strength and beauty, or restoring it when lost, is universally known and appreciated; and is recorded by testimonials most numerous in themselves, and certified by the highest authorities. It has obtained the exclusive patronage of Royalty, not only as regards our own Court, but those of the whole of Europe. From its exquisite purity and delicacy, it is admirably adapted for the hair of children, even of the most tender age, and is in constant use in the nursery of Royalty, and by the families of the Nobility and Aristocracy. It is alike suited for either sex, and, whether employed to embellish the tresses of female beauty, or to add to the attractions of manly grace and aspect, will be found an indispensable auxiliary to the toilet, both of ladies and gentlemen. Price 3*s.* 6*d.* and 7*s.*; or family bottles (equal to four small), at 10*s.* 6*d.*; and double that size, 21*s.*

CAUTION.—On the wrapper of each bottle of the genuine article are these words, in two lines, "ROWLAND'S MACASSAR OIL." Sold by A. Rowland and Sons, 20, Hatton Garden, London, and by all chemists and perfumers.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT,

For Supplying Genuine Home-Grown Seeds Carriage Free.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the several Railway Companies, which will enable them to deliver all goods (excepting parcels under 10*s.* value), FREE OF CARRIAGE, to any Station on the Great Western, South-Western, South-Eastern, or Berks and Hants Railways (which Lines converge at Reading), or to any Railway or Packet Office in London or Bristol.

The rapidly increasing connexion and distinguished patronage enjoyed by J. S. and SONS, is entirely owing to the superior quality of their HOME-GROWN SEEDS, and the low prices charged for the newest and best kinds in cultivation.

N.B.—Descriptive Catalogues, with *Prices of every Article* required for the Kitchen-Garden, Flower-Garden, and Farm, may be had on applications addressed

JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS,

Enclosing Two Penny Stamps for Postage.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also ready, and can be had on application.
181, High Holborn.

FINE PURPLE-TOP SWEDISH TURNIP SEEDS FOR SALE.—200 Bushels, pure, and of excellent Stock, raised by one of the first Agriculturists of Berwickshire, who has for many years paid great attention to the raising of Turnip Seeds.—Apply to W. KINGHORN, Dunse, N.B.

CHELSEA NURSERY, KING'S-ROAD, CHELSEA.

A FINE STOCK OF STANDARD APPLES, PEARS, PLUMS, Dwarf-trained Peaches, Nectarines and Cherries, all of the best varieties in cultivation. Large Green Hollies, Lilacs, Aucubas, Laurels, &c., to be sold at very low prices for cash, the ground being required immediately for building.—Apply to MR. LITTLE, Nurseryman, King's-road, Chelsea, Florist to her Majesty.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.
December 14.

FLORISTS' FLOWERS, 1851.

CAREY TYSO'S NEW CATALOGUE, for 1851, is now ready for delivery to applicants enclosing two postage stamps. New Treatise on "THE ANEMONE," price 3*d.*, or sent post free for four labels. Ditto on "THE RANUNCULUS," price 6*d.* of any Bookseller or sent post free, for eight labels.

*Ranunculuses, 100 splendid named sorts, 40*s.* to	£4	0*s.*	0*d.*
*Double Anemones, 50 fine ditto, 12*s.* 6*d.* to ...	1	0	0
Carnations and Picotees, 25 show flowers, 35*s.* to	3	0	0
Pinks and Pansies, 25 do., 15*s.* to	1	10	0
*Ranunculus Seed, from best seedlings, per paper, 5*s.* to	0	10	0

* These articles can be safely forwarded by post.
Wallingford, Berks.

FOR SALE, THREE MILLION THORN QUICKS, &c.—The Subscriber will deliver free in London or any port in England which has direct steam communication with Belfast.

Strong transplanted Thorns, 4 years old ...	5*s.* 0*d.*	per 1000
Twice transplanted do., 6 years old, very strong	7 6	,,
Two years seedling do., ...	1 3	,,
Three years seedling do., ...	1 6	,,
Irish Yews, 15 to 18 inches	20 0	per 100
Do., 2 to 3½ feet	40 0	,,

All well-grown, finely-rooted plants.
53, High-street, Belfast, CHARLES HOWDEN,
Dec. 14. Nursery and Seedsman.

TO BE LET, near Battersea Bridge, a productive walled GARDEN, with Gardener's Residence, two large Hothouses, Pine Pit, Frames, Tank, and Water laid on in four places; Pigstye, and Poultry-yard. Also extensive Stabling adjoining for six horses, loose box, coach-house, harness-room, man's sleeping-room, and loft. The latter would be let separately, or the whole for 50*l.* a year, rates and taxes included.—Apply to Mr. Lloyd, on the spot, Beaufort-street, King's-road, Chelsea, near London.

THE BEST AND MOST PROLIFIC EARLY KIDNEY POTATO GROWN.

"Eglinton Castle Gardens, Ayrshire, Oct. 23, 1850.

"DEAR SIRS,—Having grown a quantity of your improved Kidney Potato here, and at Pitfour Castle, Perthshire, I have in both cases found it to be earlier and a superior flavoured Potato to any other I know. Its dwarf habit makes it a most excellent variety for Frame Forcing, which I proved here last spring.—I am, dear Sir, yours truly, "WILLIAM SHARPE."

"To Messrs. Jackson and Son,
"The Nurseries, Kingston, Surrey."

THOMAS JACKSON and SON have much pleasure in quoting the above testimonial, from a well-known authority, of the merits of their Improved Kidney Potato, and they are happy to say they have now to offer fine healthy sets at 7*s.* 6*d.* per bushel. T. J. and Son have also to offer, at 5*s.* 6*d.* per bushel, good healthy sets of the Early Prolific round Potato Golden Dwarf. To be obtained of T. J. and Son, and from most of the Wholesale Seed Firms in London.

T. J. and SON have a large Stock of Fruiting and Succession Providence, Queen, and other Pine Plants, strong, healthy, and warranted clean. Price, according to quantity required, may be obtained upon application.
Nursery, Kingston, Surrey, and Royal Gardens, Hampton-court.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

GREEN AND HOTHOUSES, strong built, at the following low scale of prices:—Lean-to Roofs, 12 feet by 8, 10*l.*; 16 by 8, 15*l.*; 20 by 10, 20*l.*; 20 by 12, 24*l.*; 24 by 12, 28*l.*; and 28 by 12, 32*l.* Greenhouse Garden Lights, and Window Sashes, complete, painted three times, at 9*d.* per foot. A Greenhouse, ready built, for sale, 16 feet by 9.—Plans and particulars sent by addressing a letter to Mr. SMITH, 85, White Lion-street, Islington, London.
Estimates given for Hot-Water Apparatus.

CHRISTMAS HOLIDAYS.

THE GARDENS OF THE ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY except Sunday, from Christmas Eve to January 6th inclusive.

The HIPPOPOTAMUS is exhibited from 11 to 4 o'clock.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 14, 1850.

THE remarks in our last Number on concreting VINE BORDERS, by Mr. SPENCER, gardener to Lord LANSDOWNE, will have been read by some with entire acquiescence, by others with doubt or incredulity. As it is to be feared that the latter will prove the greater number, we venture thus early to express our entire concurrence in everything which that very intelligent writer has expressed.

The use of concrete for the *bottom* of Vine borders is no novelty; it has been frequently used to prevent the roots coming in contact with dense, sour subsoil, or to keep down the damp which in low situations will find its way to the surface during winter and spring. Such a contrivance has great value; it answers the purpose far better than any permeable substratum, and if well executed, places the Vine roots in the same condition as if they were in a huge basin, or shallow flower-pan. It has, however, its disadvantages; it permits no warmth to enter from below, and it is apt to detain too long the floods which sometimes suddenly inundate it. It is also subject to becoming injuriously dry in hot summers. As a perfect contrivance it cannot then be recognised; all that can be said about it is, that it is infinitely better than to leave the soil in its natural ill condition.

The use of concrete for the *surface* of Vine borders is, on the other hand, a very recent invention, concerning which there is little experience. It must be owned that to cover a Vine border with a hard impenetrable casing of gravel, lime, coal ashes, and gas tar, seems to be so opposed to all known principles, that at first sight the mind absolutely rejects the proposition. It prevents rain reaching the Vine roots; it cuts off all access of air; it must be too cold in winter, and too hot in summer: these are among the first objections that would be taken to it. Nevertheless, we quite agree with Mr. SPENCER in regarding all such objections as unfounded or unimportant; and the method itself—*with proper accompaniments*—to be of the greatest advantage in our cold damp climate. "What!" it may be asked, "are we to understand that you advise us to concrete our borders above and below, and all round?" No, good folks, not quite that; what we say is, that it is judicious to concrete the surface of Vine borders, if you accompany that operation by certain other processes essential to its successful action. The advantages of the plan are well explained by Mr. SPENCER; it detains moisture when it is wanted, and it excludes it when it is not wanted; it causes heat to be absorbed abundantly when earth-heat is most essential to the Vine; it maintains a congenial temperature at other seasons, and its hardness prevents the earth below it from becoming too compact, in consequence of persons walking over it.

But in order to secure the advantages of surface concrete, without any disadvantages, it seems to be essential that the border should rest upon rough materials, so put together that air can readily find its way upward through them into the border. Mr. SPENCER's border rests on rough paving-stones raised on rough walls, and is then connected with the external air or with that of the Vinery itself, which we imagine to be better. Under such circumstances, air will find its way to the roots more readily than by any other known method; and thus the conditions demanded in a perfect Vine border, viz., warmth, dryness in winter, and damp in summer, with permeability at all seasons, are perfectly fulfilled.

That the raising the border on a vaulted bottom is of very great value, concrete or no concrete, is admitted by the best Grape growers. Mr. HUTCHINSON's borders at Castle Malgwyn are so managed; the early houses at Trentham, built under Mr. FLEMING's direction, have borders of the same kind, and we now have the declaration made by Mr. SPENCER, that he too finds their great utility. We would not, however, be understood to say that these contrivances are at all times necessary in order to secure fine Grapes. On the contrary, when soil and situation are naturally suitable to the Vine, very fine Grapes are obtained without any such aids. The important point is, how to deal with this valuable fruit tree when, as so often happens in Great Britain, the soil and situation are *unfavourable*; and we submit that that problem is now sufficiently solved.

VICTORIA PARK has found a champion. A man has come forward to make an attempt at defending what is notoriously indefensible. We seldom notice such follies, and most certainly should not have altered our practice on the present occasion, if an irresistible opportunity had not occurred of showing up the peculiar manner in which the writer to whom we allude conducts an argument.

We said—1, that this park consists of 290 acres; 2, that it has cost 44,000*l.*; 3, that the manner in which the money had been expended is a national disgrace; 4, that the miserable shrubs and trees with which it has been planted were evidently the sweepings of some neglected nursery ground; 5, that it is furnished with a frightful island carrying a frightful pagoda, and accessible by a few rotten planks; 6, that one of the lodges is as ugly as the objects contained within the park; 7, that one of the main roads is unfinished and overgrown with Grass; and that this is what the country had paid 44,000*l.* for.

The manner in which we are corrected is amusing. In the first place the advocate says that Mr. MAJOR, of Leeds, was formerly criticised in our columns for what he did in the Manchester Park; and that a Mr. CURTIS, who is, it seems, answerable for some part of the offences charged against the contrivers of this park, is now treated with harshness, everything being omitted except the points upon which ridicule can be heaped. It therefore appears that there *are* some ridiculous points in the plan; not that we intended to cast mere ridicule on them; they demand a much more serious treatment. Oddly enough, however, the writer in the next breath acquaints his readers that he *does not* know *enough of the park to form a correct opinion* of it; that he means to go and see it some day! and then (as if foreseeing what the consequences of a visit must be), he coolly declares that he is no apologist "for anything which may have been done there!!" But he thinks he can rely upon a correspondent who undertakes to grapple with the alleged facts.

This correspondent says—1. That the park consists of 240, not 290, acres; but the Act of 4 and 5 Vic., cap. 27, declares that it contains "about 290 acres;" and we prefer the evidence of an Act of Parliament. 2. He says that the cost of making this park amounted to less than a quarter of 44,000*l.*; but there again Parliamentary evidence is against him; for the statement we made was taken, as we explained, from the official reports of the Commissioners of Woods and Forests. Mr. KNIGHT, in his "Cyclopædia of London," says the cost was rather more than 50,000*l.* 3. He admits that in matters of taste there will be differences of opinion, and triumphantly expresses his satisfaction at knowing that men of taste have expressed their astonishment how this eastern "Paradise!!" could have been made out of exhausted brick fields. We submit that 44,000*l.* ought to perform a somewhat greater feat than that. 4. He avers that the trees and shrubs were selected with great care, and he is quite certain that there are few situations where so healthy and vigorous a growth can be shown. Surely the writer must be some Bethnal-green weaver, in whose eyes any piece of Grass is Paradise, and every scrubby bush a picture. Only look at the wretched things! There they are; and there we hope they will remain, till after the meeting of Parliament. And what does Mr. KNIGHT, at least an unprejudiced observer, say, "The shrubs that have been planted do not in some parts seem to be *at all settled in their new habitation.* . . . . The smoke of London threatens to be very injurious to the Pine, *many of which have been planted.*" 5. As to the frightful island and frightful pagoda, we are told that there are three islands, that tastes differ, and that "all must regret that the pagoda and bridge, nay, even the water itself, are left unfinished,"——after spend-

ing 44,000*l*. 6. Concerning the lodge, the writer has only this to say, that some people admire it; but for himself he thinks the taste questionable, and that the thing would have looked better had it been bigger. 7. Finally, as to the Grass-grown road, which 44,000*l*. did not enable the perpetrators of the park to finish—why, as to that, this writer wisely holds his tongue. Perhaps it would have been more discreet if he had held his peace about the whole business.

As a specimen of *reasoning and argument* these extracts are unique, and they will do to raise a laugh at the present dreary season. But the design and condition of our public parks, especially of new ones, is not to be treated thus lightly; for their state concerns not only the expenditure of public money, but our national credit for good taste and intelligence. Regarded in this point of view we feel persuaded that Victoria-park deserves much more than we have said about it. Let us hope that members of Parliament will visit it and judge for themselves, whether it will be possible to allow the formation of Battersea-park to be entrusted to the incompetent hands of men like those who have rendered Victoria-park a public disgrace.

SEEDLING FRUITS.

Having had opportunities of examining many of these, I beg to remark, that some of the seedlings from the most approved varieties were found to partake more or less of the properties of their respective parent trees; whilst the majority were of a wild and very inferior description, and totally different in form, colour, nature of juice, and time of ripening. Such, we are informed by various authors, is likewise the case in America and the colonies. Thatcher, in his "American Orchardist," states, that "a hundred seeds of the Golden Pippin will produce large-leaved apple trees (the Golden Pippin itself has a small leaf), bearing fruit of a considerable size; but the tastes and colours of each will be different, and none will be the same in kind with the Pippin. Some will be sweet, some bitter, some sour, some mawkish, some aromatic; some yellow, others green, red, or streaked."

Seedlings from the same tree not only differ widely from each other, but even those from pips, taken from the same apple, produce fruit possessing qualities entirely different. For example, the excellence of the Ribston Pippin need only be mentioned; but the "Sister Ribston Pippin" was a white, semi-transparent, sour-fleshed Apple, or rather a large crab. It therefore appears that the same fruit may contain the germs of good and bad, both protected by the same pulp and nourished by the same juice. Whether the fruit of the parent tree of these possessed intrinsic merit has not been ascertained; but this we know, the many seeds from the Ribston Pippin have been raised; yet none of its progeny are known to inherit its peculiar flavour and excellence. The same remark applies to the Old Nonpareil.

From these facts, it must be admitted that there is a strong tendency in plants from *seeds of cultivated fruit-trees of high quality to revert immediately to the state of wildings.* We cannot suppose that the seeds taken out from this country to Virginia would have formed an exception to the above tendency had they been sown in England; and wherever sown, the nature of their produce must have been essentially the same, however much it may have been modified by circumstances of soil and climate. How far these circumstances would affect the next and succeeding generations of these seedlings, is a different question. That of the greatest importance, especially to colonists, is to know how to proceed to raise orchards of good kinds of fruits from seeds. The following extracts may prove advantageous to those interested in the subject:

Considerations on the processes employed by Nurserymen for obtaining better sorts of Fruits, and on the means by which Nature appears to accomplish the same result. By M. Poiteau. Originally published in the Annales Soc. de Hort. de Paris.

The author observes, it is but rarely that improved varieties of our cultivated fruits originate with nurserymen; they are generally the productions of chance found in the woods or hedges, or from distant corners of provinces, where the finer sorts are scarcely known, and where the sorts they have are mismanaged or neglected. That "like begets or produces like," has long been considered as a law of nature among animals and some vegetables; but this law is not always uniform, especially among domesticated animals or highly cultivated plants. Yet, on this principle, our nurserymen have acted in their endeavours to obtain better kinds of fruit, by sowing seeds of the best, in the hope that they would raise something still better. It is well known that in this process they have failed. The celebrated Duhamel and his contemporaries failed in the same way. From these and other instances the author concludes that cultivators are wrong in their expectations of obtaining at once what can only be the result of time. He seems to infer that seedlings—Apples or pears, for example, require some years and some cultivation, while they are passing from one stage of their infancy to another, before they can show their inherent qualities.

As proof of this conjecture, he instances the case of the fruit trees in the United States of America at this time. There, it appears, they have little trouble in procuring superior fruits from seeds; and that they have many excellent new kinds, their lists sufficiently testify. The cause of this he conceives to be, that the first imported fruits which the colonists received from Europe 300 years ago, were, amidst the bustle of establishing and securing themselves in a new country, lost, from neglect or ignorance of the art of grafting; and that they only had recourse to seeds for perpetuating the kinds. These seedlings have passed through several generations, and are now arrived at that period of their existence in which their inherent qualities are fully developed.

The Americans, M. Poiteau adds, attribute this to another cause, namely, that in proportion as their newly broken-up lands are ameliorated by cultivation, &c., so, in like proportion, are the qualities of the fruit. It is a common saying in Virginia, that the fruits of such or such an orchard "begin to change for the better." But this can hardly be admitted; for though such circumstances may improve the quality, it cannot change the physical characters of the fruit.

After noticing the fact proved by Mr. Knight, that a crab, fertilised by the pollen of a good fruit, produces better kinds from seed than can be had from seeds of improved fruit, he proceeds to describe the method used by the Flemish orchardists to obtain new sorts. This, on the authority of M. van Mons, may be briefly explained as follows: They sow the seeds of cultivated varieties, or, preferably, the seeds of wildings that have sprung from cultivated varieties. They rear and fruit the plants from this sowing as quickly as possible, and raise another generation from their seeds; and thus they go on, always sowing the seeds of the last raised generation as soon as they can obtain them. Good new sorts are sometimes thus obtained amongst those of the second or third generation; but each successive generation is characterised by a more general amelioration than that of its predecessor, till at last a high degree of excellence is obtained. Of some kinds of fruits, good varieties are obtained chiefly from the third sowing; in others it may be the fourth or fifth; and in Pears the sixth or seventh. This process, concludes M. Poiteau, is only an imitation of that of nature exemplified in America. *R. Thompson.*

BRITISH SONG BIRDS.

No. IX.—Our little tenants having now taken quiet possession of their freehold, we will try yet again to devise some additional means of adding to their domestic happiness.

In enumerating the particular tribes by name, it will be seen there are some which I have purposely omitted; such as, amongst others, the greenfinch, bramblefinch, the hawfinch, and the starling. The first of these is a large ugly "gawky;" with a harsh, wiry voice, painful to listen to. He will eat, too, thrice more than he is worth, in a single week. The other three are maliciously spiteful, and must be also among the rejected. They would destroy the entire colony in an incredibly short space of time, if they once gained admission.

When giving, last week, my reasons for excluding hen birds from the aviary, I left, of necessity, much for conjecture. Intelligible, however, as my "hints" were, and quite sufficient for the purpose, yet there are others; of a different nature indeed, but equally stringent.

With a view to the regular increase of my stock, I provided, when first "colonising," a number of square mahogany nest-boxes, which were fixed against the wall; also nest-bags, and such other materials as were necessary for the purpose of "building." In these boxes, from time to time, a number of nests were formed; eggs were laid; and the process of incubation went forward. I anticipated much amusement and much delight from the young progeny when hatched; but, alas! my anticipations of pleasure were doomed never to be realised. There were such "awful goings on," as I shall presently relate, among the various "settlers," that I was obliged within the first three months to commit an act of ejectment. The sex, called "gentle," was banished for ever. "'Tis true, 'tis pity; pity 'tis, 'tis true!"

Had I succeeded in establishing a peaceful colony on so grand a scale, I should have accomplished, I understand, what has never yet been done. No sooner were any eggs laid by a canary, or a siskin (aberdevine), than a rival hen goldfinch would alight on the nest box, seize the egg, and, dropping it from above on the ground beneath, listen with maniacal ecstacy to the music of its destructive fall.

The thrush, too, known universally as an "imitative" bird, would oftentimes amuse himself in the accomplishment of a similar exploit. He was ready at a moment's notice to "assist" any of the rival malcontents in a crusade against the eggs and young. No sooner were the latter born—I succeeded in getting a few broods hatched—than the conspirators went to work with an energy, and a unity of purpose, worthy of a better cause. Despite the vigorous resistance of the parent-birds, "thrice armed by Nature's powerful wand," their infant offspring were remorselessly dragged, "callow" as they were, from their cradles; suspended in mid-air, like Mahomet's coffin; and then, with deadly hate, dashed forcibly to the ground. There were a number of offenders in this way, all of whom were tried and condemned; their sentence—banishment—being carried into immediate effect.

Canaries, alone, will pair and breed excellently well in an aviary; but the admixture of a number of other tribes, for breeding purposes, is evidently a "mistake." A little calm reflection will show good reason for this, seeing how very dissimilar are the taste and habits of some birds compared with others—these courting retirement, and feeling annoyed when disturbed; those rejoicing in mischief, and never so happy as when up to their ears in excitement.

As your little friends will try every possible mode of amusing themselves at your expense, you must take special care to nail your floor-cloth, and paste your paper, evenly on the wall or ceiling. If they can only find one end that they can unravel, one projection that they can peck at, they will go to work with such artistic skill, that they will soon disfigure the room. Be careful, therefore, to give them no opportunity for the exercise of their ingenuity in this matter.

Keep the windows constantly open, and admit a free current of air, closing them, in winter only, at night. The room will always be sufficiently warm. If, however, there be any fog or continuous rainy or damp weather, *then*, of course, the windows should *not* be opened.

You will find that the birds will soon get into a habit of perching on, or rather clinging to, the ledges of the windows. To obviate this, which is very objectionable, seeing how the windows become thereby soiled, have some narrow, say 1½ inch, slips of deal, planed down, just the width of the window. Let these be "bevelled" off on one side, and carefully adapted to the bottom of every pane of glass in the room in a slanting position. By using this precaution, the birds will slide off, and soon find you are "just one too many for them."

It will take your birds some little time to get into each other's ways; but this they will do, eventually. Many and divers will be the quarrels, disagreements, animosities, and battles; but these will terminate. War will cease, and peace ultimately become proclaimed.

If any of your birds die, as fresh-caught birds often do, replace them at the earliest moment. Never turn in many at once; let one or two in, mysteriously, early in the morning. This will prevent any unusual fluttering; and the "wonder" at seeing a few new faces will gradually subside.

Whenever you purchase a quantity of "flight" birds (already described), for stock, always place them for a day or two in a large cage by themselves. It would be desirable to have two or three for this purpose. These birds are so excessively wild and impatient of confinement, that, if turned into the aviary immediately after being caught, they would not only dash frantically against the windows, thereby severely injuring their nervous system, but they would spread fearful consternation and bewilderment amongst the inhabitants. In such a case, the restoration of order would be difficult, and a work of much time.

The soft-billed birds, when first purchased, must be kept quietly, in separate cages, for a fortnight at least after being "fed off." They may then be turned into the aviary, one at a time. Being insectivorous, food must be given them which assimilates as closely as possible with their natural diet—spiders, small red garden worms, meal-worms, earwigs, &c. These should be supplied only occasionally, just to keep the birds healthy; they will, meantime, "take" to the general food, of which we are soon to speak more fully.

When the glorious sun streams into the aviary, and gilds the variegated colours of these little feathered beauties, their antics, frolics, and devotion to fun, can be but faintly imagined. The fountain, with its rippling stream; the mirrors, with their truthful reflection and multiplying powers; the harmonious concert of well-tuned voices,—cause the inhabitants as much harmless pleasure as was ever known by our first innocent parents in Paradise.

Hard must be the heart of that man, or that woman, who could witness such scenes of happiness as these, without participating in the general enjoyment. For my own part, I disclaim all wish to "fraternise" with such people. *William Kidd, New-road, Hammersmith.*

ON THE PRODUCTION OF SUGAR IN PLANTS.

Extracts from a Paper by M. Gaudichand in the "Comptes Rendus."

It is well known that the root of Beet often grows to a very large size, and that its height, varying with the soil, is often 4, 5, or even 8 inches above the surface of the ground. It naturally occurred to us to try and discover the relative proportions of sugar in the upper and lower parts of these fleshy roots, and we found that not only is sugar more abundant in the lower than in the upper part, but that it is also purer and more easily extracted.

As we were at this time almost wholly occupied with chemistry, and we had besides every facility for experimenting, we did not suffer our enquiries to stop here. In a botanic garden that we had made we cultivated Beet, and the soil being suitable, some very large specimens were obtained.

Having previously discovered that the lower and under-ground portions of the root contained more sugar than the upper portions that were exposed to the air, and attributing this difference to the action of the air and of light, or, in other words, to the formation, in the tops of the roots, of different principles, we covered the upper parts of a certain number of roots with earth; and on examination three weeks or a month afterwards, these were found to contain much more sugar in their upper extremities than those of the roots which were not covered up.

All the observations that we have made on plants containing sugar (excepting those which only contain that principle when blanched), show that the quantity of saccharine matter is directly proportional to the degree of ripeness of the plant or part of the plant con-

taining it. Beet-root, fruits, the Sugar-cane, &c., show this completely.

We have already spoken of the Sugar-cane, and our present subject leads us to refer to it again to prove the truth of our assertions, and to support them by still stronger testimony. Every one knows that this plant is a Grass whose phytons developing the one above, after and within the other, form a slender articulated stem, each node of which carries a leaf. New experiments clearly show that in the Sugar-cane saccharification begins at the bottom and proceeds very gradually to the top of the stem, joint by joint, or, to speak more properly, phyton by phyton, and that the lower internodes are quite ripe and sweet, while the upper ones are still herbaceous, and more and more acrid as they get nearer the top. This important fact has been determined in a still more direct manner by M. A. Vinson, sen., of the Isle of Bourbon, who has derived from it great practical advantages.

The following is the substance of a communication on this subject received from this gentleman on the 24th of October, 1842 :—"I received the copies of your new memoirs, &c. With regard to the Sugar-cane, a fact of the greatest practical importance for my establishment has been ascertained by experiment. It is at complete variance with all ideas hitherto received. Science comes to the aid of practice, and that is its greatest triumph. This is what I refer to.

"We buy at our factory Sugar-cane juice. The Sugar-cane planters, myself among the number, thought that the green canes gave more syrup than those which were ripe, and which, according to them, ought to be left in the ground to dry. They knew very well that the juice of the green cane contained less sugar than that of the ripe cane ; but, looking only at the quantity and not at all at the quality, we were induced to use their canes before they were ripe, and thus suffer considerable losses.

"The syrup of the green cane marks, on Baumé's areometer, from 8° to 10° ; and in proportion as the juice is elaborated, it marks from 10° to 13°, generally 12° 30′. Now, experiment has shown me that the quantity of syrup is greater in the ripe than in the green cane. It is then advantageous, both with respect to quantity and to quality, to allow the canes to ripen.

"In the green cane the bark is thick and hard, the longitudinal threads are confused, the cells are not distinct, their partitions are thick and without empty spaces ; whence it results that the parenchyma forms a compact opaque mass, which, when strongly pressed, gives a liquid that is albuminous, mucilaginous, starchy, and scarcely sweet. The cane, when it comes from the cylinders, assumes, after the most violent pressure, its original shape.

"In the ripe cane, on the contrary, the bark is thin, the longitudinal threads are quite distinct ; the parenchyma, as seen under a microscope, is composed of thin expanded partitions, and full of juice, which is the more abundant and sweet as the plant is riper. The cane, when it comes from the cylinders, is completely crushed."

The letter from which the above is taken contains the following table, which, from its evident utility, deserves, I think, to be laid before the public :

Physical state of the Canes.	Months of work.	Conveyed by two Mules, mean size.	Quantity obtained from a mill of 12 horses.	Degree marked by Baumé's areometer.	State of the Season.
Green Canes...	July...	1	1 cask 45 c.	9,00°	Cold and rainy.
Do. do. ...	Aug.	1	56 c.	9,45°	Ditto.
Yellowish do.	Sept.	1	68 c.	10,30°	A little warmer, but rainy.
Nearly ripe do.	Oct....	1	89 c.	11.30°	Hot and dry.

It is not the leaves, which in the Beet, Maize, Palm-trees, Sugar-canes, &c., secrete the saccharine matters ; but the tissues of the stem, of the root, or concentric layers, and particularly the oldest and lowest, as in the Sugar-cane, or of the centre of the lower portions, as in the Beet, Palm-trees, &c.

VILLA AND SUBURBAN GARDENING.

If our memories require jogging in the ornamental department of gardening, they also need it in the useful. We often forget that a little forethought would enable us to enjoy many little luxuries at little trouble and less expense than sending to market for them, when we might gather them in our own gardens.

There are few persons who do not enjoy a spring Radish, a young Horn Carrot, and an early Dutch Turnip. Yet even by the possessors of gardens these are seldom thought of, until they are observed in the greengrocers' windows. Immediate preparations then are made to get them sown ; when we ought, in fact, to be gathering them. To accomplish this successfully, first procure some stable-dung, this should be laid up in a ridge and turned two or three times until the heat begins to subside, when it will be in a fit condition for use. Those who have the opportunity of collecting leaves, and laying them up until they become warm, will, of course, avoid the expense of manure, as the leaves answer equally well. The expense of the manure, however, is only apparent, for it can be afterwards applied to the ground. When the heating material is ready for use, a space of such dimensions as may be considered sufficient for the requirements of the family should be marked out on a sheltered south border. In ordinary cases, a space 5 feet by 10 will be ample. The soil should be taken out and ridged round the edges, until the bed exhibits a cavity 18 or 20 inches deep. The heated manure should be placed in this excavation, and regularly beaten down firmly with a three-pronged fork, until the bed is rather more than brimful. There must previously have been secured some light loamy soil, moderately rich, and in a dry friable state. Six inches of this prepared soil should be placed on the bed. The seeds may then be immediately sown. If the dung has been properly prepared no danger will arise from overheating. One end of the bed may be sown with Carrots, the other with Turnips, and a sprinkling of Radishes may be cast over the whole. The latter will be gathered before they injure the other crops.

The next point is to protect the bed from frost and heavy rains, which may be expected if these things are sown in January or February. The bed can either be hooped over and covered with mats in the usual way, or a very effective covering might be made with asphalte, stretched on a few rods, giving it a slight inclination, to throw off the rain. In very severe weather, a more secure protection will be required. When the bed is first made, and the seeds sown, the covering should be put on at once, and it may remain on until the seed germinates, when the bed should be exposed in all genial weather. *Pharo.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND ; OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

No. VII.—Odds and Ends.—

Culture of the Mind.

height of stem before the principal arms or arms are permitted to branch off, must, of course, first depend on your wall ; next it will be necessary to measure it by the height that children's fingers can reach before they can be trusted, which measure will be found usually to vary, as that quality does in their parents, and according to the method of education pursued by them.

The measure of children's trustworthiness.

Of Muslin Bags.—To protect the fruit from wasps and birds, muslin bags will be necessary. And the making of these will afford useful employment to the good wife during the winter months, instead of losing her health, destroying her clothes, neglecting her home and children, and sending her husband to the public, by working in the fields during that season of the year.

—For nothing lovelier can be found
In woman, than to study household good.
Milton.

Thinning the Berries.—To obtain perfectly ripened, large and sweet-flavoured Grapes, thinning the berries is absolutely necessary. This operation should commence as soon as the berries are well set, and should continue till the bloom appears ; up to which time no berry should be allowed to touch its neighbour. It should be done by sharp-pointed scissors, which might be put into the hands of well-trained children, only agreeing that they should not too often try whether the Grapes were ripe, and that they should have a share promised and given them when really ripe. The half-ripe berries would probably make good vinegar. Do not pull off the leaves to expose the fruit to the sun's rays, which are much more beneficial to the Grapes after passing through and becoming tempered by them. There should be, as nearly as possible, one uniform covering, of a single leaf in thickness, over the whole space of wall.

Wyse men always
Affyrm and say,
That best is for a man,
Diligently
For to apply
The business that he can :
And in no wyse
To enterpryse
Another faculte.
—*By one Maister Thomas More.*

It is very important also that each bunch should hang as near the wall as possible, yet not so close as to crush any of the berries.

Crowded houses and close air produce infectious corruption, both of body and mind.

I have not treated of the diseases of the plant, as, since I have pursued the system herein set forth, I have had no experience in anything of the kind.—*C. A.*

Temptation to be overcome by promised reward.

The happiness of life, like the light of day consists not in one brilliant flash, but in a series of mild and chastened rays.

Modesty is a becoming veil to a fair woman, but a forward and impudent look entails sour fruit.

Culture of the Body.

And, if reasonable man would as carefully reject all things hurtful to his body, there would be less need of physicians.

PINETUMS.

As Coniferous plants, and their allies, either in selections or collections, are becoming indispensable addenda to the grounds of all lovers of the beautiful forms presented in the vegetable kingdom, it may not be an inappropriate season to discuss a few points in the arrangement of the Pinetum.

It is painful to witness, in many instances, large and valuable collections of Pines scattered about the nooks and corners of parks and pleasure grounds, without regard to the future space which the individuals are likely to occupy, with utter disregard to appropriation of situation, and with no eye to the character ultimately to be given to the scenery of which they are to form a part. In some instances we see a fine specimen struggling in the precincts of the flower garden, beneath the overshadowing branches of some giant Oak or other tree, which cannot, or, at least, would be next to sacrilege to remove. The Pine, doubtlessly, had been planted there when a minute plant, with no prospective recognition of its capabilities, and now, like a "blot on the 'scutcheon," a constant source of regret to its owner ; deformed in its habit, stunted in its energies, when it might have been a "thing of beauty," with all its attendant influences. Again, a portion of land is pointed out to you in which it is asserted that Pines are planted extensively, due space having been given to allow for the development of all their natural capabilities. In your progress to the spot several fine specimens may be seen peeping, like land-marks, above the tangled mass of Brake and Briars, Gorse and rubbish, in which vainly you seek the smaller members of the fraternity. In another domain portions of the park are fenced off and devoted to Pines. Here they are planted literally pell-mell, jostling each other even in their infancy. P. Hartwegii is smothering Pinsapo, macrocarpa deforming Lambertiana, Deodars mingling their branches with Araucarias ; in fact, the results of a liberal outlay becoming a deformity rather than a beautiful feature. A few rods from this you will probably see some "crates" protecting detached plants, which, if they have succeeded, are damaged from confined space or overtopped by Nettles and rank herbage. It is but justice to observe that such conditions are entirely to the charge of the proprietors, and not to those who have them in care.

In almost every instance Pines are planted too thick ; and this state of things is not, and, in many instances, will not be fully recognised, till the individual plants have attained a magnitude that will render their transplantation hazardous or totally impossible, if their future well-being is to be recognised, leaving out of the question the deformity which the remaining trees must suffer from being crowded. It is doubtless possible to group Pines with an ultimate good effect in particular scenery and localities ;* but a perfect knowledge of the adult characters of each species must be known to the planter before he commences operations. But it is doubtful if such an arrangement, where picturesque effect is sought, can be carried to any great extent beyond allowing each group to be formed of one species. Such a system may be departed from by employing only the true Pines ; but the Abies and Pinus, possessing such an individuality of character, would be more suitably located in detached spots, several trees forming in the distance a group, of which each individual should form a part of a whole. With the true Pines, such as macrocarpa, ponderosa, &c., several in a mass would doubtless, in an adult state, form highly picturesque objects. Some idea of such may be formed by viewing a group of several old Scotch Firs mingling together ; nothing in the way of trees can be more attractive. I have seen a collection in which there are some points worthy of consideration. They are arranged on either side of a rambling pathway, accessible at all seasons by being gravelled ; but the uniformity is too great in the disposition of the individual specimens, and a too great proximity will ultimately be observed and regretted.

It surely would be well for those who so liberally purchase valuable plants to have an eye when planting them to their future appearance. There is something worthy of observance in the old adage, which asserts that every man may do what he wills with his own ; but I doubt if we can wholly recognise its truth where a future generation is to participate in the results. And in the development of the newly introduced, or newly planted species of Pines, although it would be uncharitable as well as unjust to infer that the planters will not derive a large share of enjoyment, yet we must confess that posterity will behold their greater beauty. Witness the magnificent Cedars of Lebanon, adding a nobleness, a dignity which cannot be described, to so many of England's mansions and demesnes. In conclusion, I would intreat those who possess collections of this noble family to set about arranging them during the following planting season, now at its advent ; and to those about to form a Pinetum, I would say—consider, and form some suitable design before you commence. *G. L.*

* I mean grouping such as will allow the branches of each to commingle with the other.

TRADE MEMORANDA.

The enquiries respecting a person of the name of Beale, or Bean, of Nailsworth, near Stroud, can be answered by some of the London dealers in Turnip seed, to whom application should be made. A firm on Cornhill can probably give the required information.

Home Correspondence.

Effect of Climate on Plants.—Since reading your remarks on the manner in which races of plants are affected by climate, it has occurred to me that the following extracts have a bearing on the subject. The first is from a letter received from a friend in Port Philip, for whom, when leaving this country some nine or ten years ago, I prepared and packed some Apple-trees, with the view of testing the possibility of sending our cultivated fruits to that colony. He also took a quantity of seeds with him, including Apple-pips : he says, "I managed to get the seeds over quite fresh and good, but only three of the Apple-trees lived ; I have them planted in a corner of my little garden, and although they have turned out to be worthless sorts, I cherish them as remembrances of dear old England. They are not much better than Crabs. I have a good many young trees from my seeds, but they do not seem to do so well here as in England. The leaves are not like the leaves of the Apples at home ; they are so

small and crumply, almost like those of the old Crab we used to pelt on our way to school." Now, I know that even in this country it is difficult to get good fruits from seed, and I have seen some nearly as bad as Crabs from seeds taken from first-rate sorts. But I was unable to account for the trees taken over turning out badly, as I packed nothing but first-rate varieties. I imagine, however, that my friend had only got the stocks alive (they were Crab stocks); not being much of a gardener, he might have cut quite down to the stock in removing the dead parts; but it may have been otherwise. The next extract is from a relation who went out a few years since, and for whom I also packed seeds and trees. He says, "All the Apple-trees died, but it may have been my fault, as I opened the box two or three times, to see how they were getting on, though you told me not to do so. All my seeds, however, were good, so I have a fair supply of everything that I brought out with me; but the Apple-trees do not seem to succeed well here (in the neighbourhood of Geelong). I have got plenty of seedlings, but their leaves are not much larger than those of Sloes." After reading Mr. Henfrey's remarks in the "Botanical Gazette," I wrote to my friend to take care of all the young trees, and let me know if they fruited, so that I hope to hear something more of them. *John Middlemiss, Gardener to Arthur Pott, Esq., Bentham Hill, Tonbridge Wells.*

Capability of Thrift (Statice armeria) to withstand Drought.—We are informed in botanical works that Thrift is common on the muddy shores of the sea in salt marshes, and upon the tops of the highest mountains; perhaps the following notice of it may be new to some of your readers. Last summer a friend visited the island of Arran, and during his stay there collected a number of native plants that grew upon the coast, and also picked up a few that he met with upon Goatfell. He had no way of preserving them in good condition either for the herbarium or the garden, so they were all bundled up in brown paper, and remained in that state for several days. Among the collection there was a hemispherical tuft of Thrift, about 6 inches in diameter at the base. It appeared quite dry and withered, and any one that might have seen it in that state would have pronounced it dead. It remained some days longer in my possession before I thought of steeping it in water. It remained in the water a few hours, and was afterwards placed upon a flat stone on the top of a wall, about 4 feet from the ground, without any earth near it. The weather being hot at the time, the tuft did not show any signs of life for some time; however, it began gradually to revive, and is now in a green, and to all appearance in a healthy state, without receiving any nourishment but what it gets from the atmosphere; for after the first steeping it never got any more moisture, except that of rain and dew when they fell upon it. There is a hollow in the inside, and in it a number of new roots are forming. I examine them from time to time, in order to witness their progress; and before closing this notice I went to see how they were getting on, but the tuft was firmly fixed to the stone by a cement of ice. *P. Mackenzie, West Plean, Stirling.*

Aphelandra cristata.—The following is my method of managing this showy Acanthad. I cut the plants back to the first joint, about the middle of February; I then shake them well out, and carefully repot them in as small pots as I can get them into. The soil which I use is turfy loam, rotten cow-dung, a little peat, and rough charcoal. I plunge in a little bottom heat, and place the plants as near the glass as possible. As the roots fill the pots, I keep shifting into larger ones until they are into the same size in which I intend to flower them. When the blossoming is past, I place them in a warm greenhouse till the following February, and then I proceed as before. *E. T.*

Vine Culture.—It has been hinted that if you have your Vine-roots in a good border, you cannot fail to have fine Grapes; but a Yorkshire friend tells us that we may always expect at times ill-flavoured and badly-coloured berries, with the best made borders, and under the very best management. If my employer were to walk through his Vineries, and ask me if this house contained black Grapes, and I said that it did, I should not like to send crimson ones to his table in their place. If any Grape will not come up to its flavour and colour with me by one means, it must by another. Of the whole Vines with which I am acquainted, hardly two kinds require the same treatment, and yet many plant a collection in one house. Under such circumstances some must fail. For instance, if Hamburghs and Muscats are planted in one house, to have the Hamburgh well flavoured and coloured, you must shank the half of the Muscats, because the latter will not admit of the same treatment as the Hamburghs; and then, if you try to have your Muscats fine, you must be contented to have your Hamburghs badly coloured and ill-flavoured. Some may get good Grapes in this mixed way, and so do I by means of scheming and contriving; but I believe this to be one of the causes of so many complaints that are continually being made about failure in Grapes. I am of opinion that we have not gained anything on our forefathers in Grape-growing. Some of them knew the nature of every Vine they grew; we seldom see fine Grapes shown early in the season at any of our great exhibitions; there was hardly a fine dish of Grapes at Chiswick in May last. If they were swelled, they were badly coloured, and not what might have been expected at such a place. It was very evident, however, from the size of the berries, that the roots have done their part, and I venture to assert that more of the evil lies in mismanagement than in the borders. In conclusion, let me strongly recommend front Vinery walls to be arched, and to have divisions inside, each division only to contain one kind of Vine, which should be planted 2 feet inside the arch; and, above all, make yourself well acquainted with the nature of the kind of Vine you plant. Let your borders be made according to previous directions given in this Paper, maintain good management, and you will not fail. Let no one imagine that I allow any very sudden change of temperature to take place at any stage of the growth of the Grapes. *D. Kidd, Garnstone-park.*

Timber Seasoning and Sawing.—Amongst the various ways in which wood may be artificially and expeditiously seasoned, one of the most efficacious modes appears to be the exposing it to the vapours of water in a boiling state, and as many agriculturists possess means of steaming food for cattle, the same apparatus might with little, if any addition, be applicable to the seasoning of all the wood required for farm buildings, repairs, and implements. Where the steam vessels for food were too small for the reception of timber, they might easily be enlarged by putting together a few rough boards, so as to make a steam chamber of sufficient capacity. This chamber need not to be accurately steam-tight, since it appears, by an article in the "Mechanics' Magazine" (numbers 1415 and 1416), that the vapour of water for seasoning wood ought not to be dry steam, consequently a small escape of it through imperfect junctures would be advantageous rather than otherwise. In the case of large timber, as for beams, the steam chamber must of course be made sufficiently capacious to receive the entire beam; otherwise wood previously to steaming should be cut into small scantlings, or even roughly brought nearly to its destined shape; thus, besides avoiding the need or large steam chambers, the operation of seasoning would be expedited. Steaming of timber has lately been had recourse to in the royal dockyards for checking the ravages of the Lymexylon navale; the economy of this insect does not seem to be known, therefore it may be doubtful whether steaming of the wood may merely destroy the pests already existing in it, or whether by closing its pores, or by decomposing the natural juices of timber, if the food of these insects, the wood may be permanently protected. Besides the increased durability obtainable by the due seasoning of wood, there is a farther great advantage when this is done before putting the parts of a work together, namely, that junctures of all descriptions remain permanently as perfect as when first put together, and slender parts are not liable to warp. Greenhouse sashes and lights, for example, even when made of what is called seasoned wood, that is naturally seasoned by keeping it in store a year or two, are frequently found after a short time to become more or less disconnected by the shrinkage of the material. Such defects, it is true, are usually concealed and slightly remedied by filling up vacuities with putty, and covering the smaller ones with paint; but work cannot be called sound where such expedients are had recourse to. On this account it may, perhaps, be to be regretted that wood for the lights of the "crystal palace" has not been artificially seasoned; it might have been done either by means of steam, or in Mr. W. Strutt's mode by warm air, without occasioning delay; possibly Mr. Paxton was not acquainted with the facility afforded by both of these modes for the seasoning of wood. Speaking of this magnificent structure brings to mind another circumstance that shows how little a knowledge of what has been done in the useful arts has been disseminated. Mr. Paxton, when giving an account of the origin of his plan, said that in the year 1837 he visited all the great workshops in London, and in several of the great manufacturing towns, to see whether any machinery had been invented for facilitating the working of wood, but found only a grooving machine; that he improved upon it so as to make the sash bars complete, and that the Society of Arts in 1841 awarded him their medal for this machine. The tardiness of manufacturers in adapting useful inventions is well known; but it seems remarkable that a society, such as that of "Arts and Manufactures," should have been ignorant that extensive machinery had been long in use for performing a great variety of operations for the working of wood-machinery, for which patents had been taken by the late Sir Samuel Bentham in the years 1791 and 1793, and which, as they were published in the "Repertory of Arts," might doubtless be found in the Society's library. Much of the machinery therein described was actually in working order in the year 1794, particularly "apparatus for preparing all the parts of a highly finished sash frame." That machinery had been the subject of eulogium in the House of Commons, and early in this century a considerable number of these identical machines was taken to Portsmouth dockyard, and there, under Sir Samuel's management, were brought into constant use; particularly, besides various saws, "machinery for rebating, cutting dove-tails and tenons, boring and cutting mortices, and for forming mouldings." That machinery was productive of important savings in workmanship, as for instance small deal tables—1000 a year for the fleet—that before had cost 20*s.* each, were, by the use of his machinery, furnished at little more than half the price, namely, 10*s.* 6*d.* each. This machinery was seen in use for many years by the multitude of visitors to the wood mills in that dockyard; it seems unaccountable that amongst those visitors there should not have been some from the Society of Arts and Manufactures, though none of those gentlemen might have read the patents or any of the published accounts of Sir Samuel's machinery. The extensive scale on which machinery is now employed, excites the idea that it is only applicable in large manufactories; on the contrary, much of that in question is equally suitable for the working of wood for a large farm, or by the village carpenter. A considerable part of it was at first contrived for the express purpose of giving beneficial employment to untaught hands; by the use of such machinery no dexterity or skill is necessary, excepting for the putting the several component parts of joinery together, that any labourer is competent to do the greater part of the work; at the same time, as the machines are brought into action by simply turning an axis, they are capable of being advantageously connected with a steam-engine. One little engine that was in use 56 years ago would be particularly useful for working on a small scale; it was put in motion by the foot, and besides cutting straight work, the apparatus by simple means could be adjusted to cut wood at any desired angle, and at any desired depth. Ere long it may be expected that engines for working wood will form part of the ordinary stock of dealers in horticultural and agricultural machines and implements. *M. S. B.*

Successive Vegetation.—We often hear from time to time that when one crop of vegetables is destroyed or worn out, another somewhat different soon makes its appearance. I saw an example of this lately on a small scale. It is well known that many building stones imbibe water more readily than others, and that when moisture abounds in stone it is soon covered with a coat of vegetation commonly beginning with some species of Cryptogam. Stones that were used to set pots with greenhouse plants in them on, soon got covered with a green substance, probably the Chlorococcus murorum; and although often well rubbed off with sandstone and water, another crop soon made its appearance. Last summer, when the stones were pretty dry, they were painted with what painters call a stone colour; the paint certainly had the effect of preventing the green substance from making its appearance; but then another crop of vegetable, lower in the scale of existence, has appeared in abundance. *P. Mackenzie, West Plean, Stirling.*

Royal Botanic Garden Edinburgh.—It's no fair o' that cheil "Todman," to speak sae lightly o' our pra Potanic Garden thats peen the wunner o' a' braid Scotland, for by a' folks that cam frae ayont the sea. We hae a Curatar an' a Professor whilk nae garden in a' the lan' can boast o', exceping Glasgo', an' thats nae great things to blaw about; altho, our organ has peen playing a spring on its wonderments, the last three ookes, an te' haf o' thats a' lees. Theres nae garden put this that has a curater, the Duukes' man's but a gardener, and sae's a' the rest o' them. The pody "Todman" says he gat his nase flattened, faith 'gin her-nain-sell Dougall McIvor had na been thrang creashing te' muckle wheel o' te' steam-poiler, she wad hae flattened his hale pody, the ettercap creatur. Him, feuch', to crack apout our pra plants as he did, an' you to put a' his tan'tidd tale in print, shame fa' ye baith; gin ye ever come ta' Embro, tak tent an' bide up abut the new toon, an' no venture oe'r Canna mills prig, in case ye gan' awa' wie' mair holes ie' yer skin than ye hae at present. The pody "Todman" kent na a single plant by its right potanic name, sae Sandy Mactagart tellt me hisseli, an' hee's our foresman, an gaen tae a gran' place i' the sooth, to be a curatar himsell. Gin I'se be spaired i' life an' limb to come up wie sum o' oe'r farlies frae the Potanic to atorn Mr. Paxton's muckle glass house, whilke belike is no muckle gran'ner than our ain winter garden in the experimental, whilk is considered by a' canny Scotsmen wha' like dooce decent men pid at hame, an' dinna run our the world like lan'loupers an' neer-do-weels, to be ain o' the seven wunners o' the warld, i'll gae "Todman" his pakes, an' aboon a', as muckle o' my mind, gin I forgather we him, as will keep him wreetin to the *Gardeners' Kronikle*, for twa years tae come. Our Curatars a shentleman an' no gaun to be testurbed at his kail, nor pe at the pidding o' a' the "Todmans" frae the south that ever was porn. Gin he had only stapped into the experimental he wad hae got something like sence stapped into him. Man, we hae there trees stan'ing on three legs, like three legged creepies—an' we hae five or sax different kinds o' trees a' growing out o' ae' stem. Besides, we hae two deed men, made out o' stane, an' cut our by the waist, sitting in our gran' ha', an' for fear they should tak cauld there is a white sheet thrown our them ilka night, whilk I hae thocht should hae been taen awa, an' twa blue aprons put o'er them, as mair pecoming ti auld an' nople craft o' free gardeners. *A much offended an' ill-pleased person, Dougall McIvor.*

How to enlarge Vegetables and induce early Maturity.—A great increase of food might be obtained, and that of a superior kind, by systematically carrying out for a time the principle of increase. Take, for instance, a Pea; plant it in very rich ground; allow it to bear the first year half-a-dozen pods only, and let these be from the main stem, which always ripens seed first. Sow only the largest single Pea the following year, and of the produce retain three pods, sow the largest seed the next year, and retain one pod; select the largest Pea, sow it next year, and the sort will have trebled its size and weight. Ever afterwards sow the finest seed, and by these means you will get Peas, or

anything else, of a bulk of which we have at present no conception. *An Old Subscriber.* [May we be permitted to ask for some *evidence* on this subject ?]

Sweet-scented Gnaphalium.—I read a review lately, of a work entitled "El dorado" by Mr. Taylor, an American, describing the adventures of himself and others in California. In describing his journey from San Francisco to Sacramento, or Monterey, extensive arid wastes that he passed over, he says, "the Grass is quite withered, or burnt up, but the air was perfumed by a sweet-scented species of Gnaphalium!" Now, I am curious to know if any species of that genus is known in this country, possessing such desirable qualities, and if so, which is it? Whatever qualities the tribe are distinguished for, as "Immortelles," &c., they are not remarkable for their sweetness; at least, if any are, I was not aware of it. *Quercus.*

Vine Borders.—I imagine it will be found on trial, under certain conditions, that the most economical and convenient situation for the roots to ramble in is the ground-floor of the structure in which the Vines are grown. And now for the "conditions:" heat is indispensable; but it must be applied to the surface, and not under the roots; concrete in any shape is not required; neither is it requisite that the borders should rest on paving stones, supported by walls of masonry. By applying heat to the surface, this is rendered unnecessary. With me the roots penetrate through bricks and mortar, in order to obtain heat, and with heat I could lead them anywhere; therefore there need be no fear of their descending into unfavourable soil; deep and rich borders must be avoided, as must also carrion or other nostrums of the day; the natural soil of the Vine should be imitated as far as is practicable; and tepid soft water, and clear liquid manure, applied freely, when necessary. For supplying heat, leaves or tan answer very well; and if hot water or hot air is used, then all may be covered permanently with gravel, or anything most convenient, for the border will never afterwards want to be disturbed. Something similar to what I have attempted to describe has been in practice for the last 16 or 18 years; and the plan has produced fine crops every year, and at all seasons of the year; two crops of Grapes could easily be taken from the same Vines in one year; but for permanent Vines, that should not be put into practice. *G. M., Wetherby, Yorkshire.*

Vegetable Instinct.—In the course of my reading I find that there are those who maintain that there is such a thing as vegetable instinct or sensation in vegetables, and they tell us that instinct is a peculiar disposition or tendency in a living being to embrace, without deliberation or reflection, the means of self-preservation, and to perform, on particular occasions, such other actions as are required by its economy, without having any perception for what end or purpose it acts, or any idea of the utility and advantage of its own operations. Climbing plants, they state, afford a curious instance of this instinctive economy. Some of these having very slender stems cannot, like most other plants, grow of themselves in a perpendicular direction; but in order to compensate for this incapacity, Nature has given them the power of moving or twining their branches and tendrils in different ways, until they generally meet with a tree or some other body on which to climb or attach themselves; and when a tendril has laid hold of a support, it coils up and draws the stem after it. Knight, on the other hand, while treating "On the Causes which influence the direction of the Growth of Roots," says, "In all the preceding arrangements the wisdom of Nature, and the admirable simplicity of the means it employs, are conspicuously displayed, but I am wholly unable to trace the existence of anything like sensation or intellect in plants, and I therefore venture to conclude that their roots are influenced by the immediate operation and contact of surrounding bodies, and not by any degrees of sensation and passion analogous to those of animal life; and I reject the latter hypothesis, not only because it is founded upon assumption which cannot be granted, but because it is insufficient to explain the preceding phenomena, unless seedling plants be admitted to possess more extensive intellectual powers than are given to the offspring of the most acute animal. A young wild duck or partridge, when it first sees the insect upon which Nature intends it to feed, instinctively pursues and catches it, but Nature has given to the young bird an appropriate organisation. The plant, on the contrary, if it could feel and perceive the object of its wants, and will the possession of them, has still to contrive and form the organ by which these are to be approached. The writers who have contended for the existence of sensation in plants, appear to have been sensible of the preceding and other obstacles, and have all betrayed the weakness of their hypothesis in adducing a few facts only that are favourable to it, and waving wholly the investigation of others." Has anything new appeared on this subject since Knight wrote the remarks that I have just quoted? *C. Mackenzie, West Plean, Stirling.*

The Polyanthus.—This is a very charming winter flower, and particularly in places where there is little or no glass. If such plants as are showing bloom are taken up now out of the borders and potted, they will soon make a very pretty display, by being simply protected, either in a frame, cold house, or in the window of the dwelling-house, giving them all the air and light possible. Under this treatment, they will present a delightful realisation of the coming spring, during these next two months, and they will require very little care. From the circumstance of this season having been so mild, there are plenty of plants suitable for immediate potting; but to have these in all seasons, seedlings should be raised immediately the seed becomes ripe, and the plants, therefore, will mostly show flower the autumn succeeding. *Wissingham.*

Superphosphate of Lime.—Having a packet of superphosphate of lime, I am disposed to use it on Geraniums and other flowers in my conservatory; but, not knowing its effects, I should feel obliged by your informing me—Is it a good manure? what would be its effects? how to use it? and if the addition of sulphate of ammonia would improve its properties as a manure, with the relative proportion to be mixed with the superphosphate? *An Admirer of Fine Flowers.* [Perhaps some correspondent who has used the superphosphate in the manner described would favour the writer with his experience.]

Reviews.

Gardiner's Twenty Lessons on British Mosses, second series (Longmans), is one of the nicest little books for young people beginning to study botany. It contains just as much science as renders it useful, without a word to make it tedious. It furnishes beautifully dried specimens of a good many Mosses, and thus becomes a much better aid to the learner than plates of any kind, however well executed, possibly can be. The fault of the book is its supersaturation with poetical extracts, having no obvious relation to the matters with which they are connected. We observe that Mr. Gardiner undertakes to name collections of plants, for a small fee, and that he also prepares volumes of dried Ferns, Grasses, Mosses, Seaweeds, &c.

Tyso on the Anemone (Jackson and Walford). Who should teach the cultivation of plants like those who cultivate them best? Mr. Tyso's fame as a grower is known to everybody; let everybody therefore read his little pamphlet, of which the following is a sample:

"*Soil.*—The soil should be a friable loam, in which gritty particles abound. Decayed turves form an excellent basis for compost. The manure to be added should be vegetable, in preference to animal, and be incorporated with the soil, rather than deposited in a layer below the tubers.

"*Time of Planting.*—There are two seasons for planting, viz., the middle of October, and the end of January. The early vegetation of such roots as are left in the ground, would intimate that the former is the most *natural* season; and undoubtedly October planted tubers make stronger plants, throw up more flower buds, flower earlier, and when the season is favourable, mature finer blossoms than those that are planted in spring. The main drawback is, that the blossoms expand before frosts have ceased, and hence a larger amount of care and protection is requisite. A bed planted the first week in October, 1849, was in beautiful bloom the 12th of May, 1850; and on the 16th of that month, the thermometer only a few yards distant, registered 25°, which would have ruined the blossoms had they not been sheltered.

"*Planting, &c.*—Make a bed of your prepared compost in a sheltered spot in the garden, where the subsoil is pretty well drained. Three feet four inches will be found a convenient width, and at least 15 inches in depth. Protect it from heavy rains, so that it be tolerably dry when required for planting. Rake the surface level, and mark the bed in cross rows. Plant five roots in a row, which will allow six or seven inches apart. As the tubers are varied in form and size, the hand or a trowel should be used to make the holes, two inches deep, and large enough to admit the root to rest evenly on the soil; avoiding much pressure, as the limbs of the tubers are often slenderly attached to the crown, and are easily broken off.

"Anemone tubers are formed of irregular fleshy bunches, having a number of small protuberances called crowns; these crowns are distinguishable as tufted apices, or obtuse points, often a shade darker in colour than the surrounding skin. They are frequently found in clusters, near the centre, and sometimes singly at the extremities of the projecting limbs. They are easily recognised by the practised eye, but as amateurs have frequently been known to plant them upside down, some attention to this matter is needful. The base or lower part of the tuber is known by the remaining fragments of the fibrous roots of the former year, unless indeed they have been very carefully cleaned away. The direction to plant the *right side upwards* seems very trite, but is not in this case altogether superfluous."

Miscellaneous.

On the Resuscitation of Frozen Fish. By Prof. O. P. Hubbard.—For a number of years, during my residence in New Hampshire, I have received from numerous sources, the statement that fish taken in the cold of winter from our ponds and thrown out upon the ice and freezing quite hard, have been restored to their usual activity when thrown again into cold water. That they would ever have moved again if left alone is incredible; and how far and for what time a fish may be frozen and yet be restored is not shown by experiment. I have good reasons, from the character of my informers, for believing that the facts are as stated, though when repeated they are hardly credible to others; and I am much gratified in obtaining for publication the following authentic account of a satisfactory instance. "Some time in the winter of 1838 or 1839—living near a stream abounding with fish, which emptied into a pond near by—I was in the habit, daily, of catching them (as they passed down stream), by means of an eel-pot. This was so constructed as to receive and retain them without injury, if taken out soon, and on one occasion, the pot having remained longer than usual, so many were caught as nearly to fill the pot, and numbers perished from pressure or want of air. It was the custom to examine the pot in the morning. On one occasion, a severe cold morning, in January I think, I took up the pot and found a considerable number were taken. These I emptied upon the snow, which was deep and so crusted with ice as nearly or quite to bear me up. I then replaced the eel-pot in its proper bed for another draught, which took me about 20 minutes, and then gathered up my fish, exposed on the snow, into a pail or basket, and found them frozen as stiff as icicles. I carried them home to the shop, where they remained frozen, according to my recollection, for the space of an hour and a half longer, and so stiff and inflexible that they could not be bent without cracking, as did some of their tails and fins in pulling them apart when they were congealed together. I then put them into a tub of water drawn from the well, to thaw them for dressing, and I think added a small quantity of warm water that stood upon the stove, but am not certain whether it was before or after scaling them. After some little time, how long I cannot now say, I examined them to see if they were thawed sufficiently for dressing, and to my surprise, I found some of them as lively as when sporting in their native brooks. I called on others to view them, who had seen them while they were frozen. To them also it appeared almost incredible, but we were constrained to believe our own eyes and senses. I think those fish were perch that came to life after (I cannot say death, but) freezing. In the spring, I remark, we set the eel-pot with its mouth down stream, as then the fish are running from the pond up stream."—*Silliman's American Journal for July* 1850. *Annals and Magazine of Natural History.*

Rockwork.—Persons who have a fancy for a rock or Fern garden, will do well to keep it somewhere in the back-ground, and not in sight from the windows of the house or the principal parts of the lawn. It may be made very interesting if thus secluded, and be approached from the main walk of the garden, through a rustic arch, mantled with climbers, or by a kind of narrow winding passage, canopied and darkened with evergreens. Masses of rockery may even be placed fronting the chief line of walk, at some distance from the house, where a good dense screen of planting can be interposed between them and the lawn. Or they can be employed as a sort of rustic basement to a building. To grow Ferns upon them, the shade of trees, or some other objects, will be indispensable; but many rock plants prefer an open sunny situation, so that rockeries should not be entirely shaded. If accompanied with a small pool of water, having a broken rocky margin, a few of the smaller aquatics may be grown, and gold fish can be cherished. The moisture exhaled from such a piece of water would be very beneficial to many rock plants; and the jutting pieces of stone, or overhanging shrubs, would afford shelter, and privacy, and shade, to the fish. Rockeries should be formed as much as possible of natural materials. All the products of art, such as fused bricks, scoriæ, and the far more vulgar constituents with which such ornaments are often constructed about towns, are nearly if not quite incompatible with any amount of rusticity. And this last should be the distinguishing element of all rockeries. As in the material employed, so also in the mode of construction followed, rockeries should be conspicuous for a natural character. No appearance of art, and no approach to the regularity or smoothness proper to works of art, will be at all in place here. On the contrary, the surface of the whole cannot be too irregular, or too variedly indented or prominent. An additional projection must be given to some of the parts by moderate-sized bushes, or short-stemmed weeping trees. Evergreen shrubs or low trees will be particularly useful. Provision will therefore have to be made, in the placing of the stones, for planting a few shrubs, and a greater number of herbaceous rock plants in their interstices, which should be left broader or smaller according to the size of the plant that may be required in them. No rockery will ever be interesting unless well supplied with all such fittings. For ordinary practice, the materials of which a rockery, however small, is formed, should lie on their broadest or flat sides, and not be set on edge, much less be placed with their points upwards. Little deviations may occasionally be allowed, for variety; but the mass will have more appearance of solidity and strength, and be more accordant with Nature's teachings, if each piece be laid flat, with the outer edge shading a little downwards rather than upwards. A rock garden may, if its size demands it, be traversed or made more generally accessible by very narrow walks, just capable of admitting one person. These need not be of any uniform width, and should have no regular margin. They may be made of some quiet-coloured material, and not covered with dressed gravel. Any great elevation should never be sought in small rockeries. This would both be inconsistent with their breadth, and would render them too prominent and artificial. They should not be carried higher than the point at which they can be well supported and backed with a broad mass of earth and vegetation. Additional

height may sometimes be given, if desired, by excavating into a hollow the base from which they spring. An old quarry will supply the foundation of an excellent rockery, in which considerable height, relatively to the bottom, may be attained, and much of boldness. It should be seen, however, that in working it, masses of rock be merely wrenched or blasted off, in the most irregular manner, and no sawing or cutting to an even face be anywhere permitted. Extreme ruggedness of surface is what would be most characteristic in such a situation. Shrubs with trailing habits, evergreens, and a few of the less delicately branched weeping kinds, and those which assume a wild, and ragged, and picturesque character, are most congenial to rockeries. The first class, especially, includiug the Ivy, the Savin, Cotoneaster microphylla, Berberis empetrifolia, Periwinkles, common Heaths, &c., always seem in place and at home. And the more decided climbers, such as Clematis, the Hop plant, Wistaria sinensis, some of the better sorts of Bramble, the Ayrshire Roses, and several others, would, if suffered to scramble over ther bolder parts of rockeries, and duly pruned and regulated so as not to smother things of more value, be most important and engaging accessories. Grass never harmonises well with rocks, if brought into immediate contact with them. They demand the adjunct of a rougher and less polished vegetation, such as attends them in a state of nature. Common moor Heath, Whortleberry, &c., cut into sods, and laid with a broken line along the margin of rocks, and interspersed, in parts, with the dwarfest trailing evergreens, will give a beautiful rustic finish, and may be particularly valuable in connecting the rocks with any dressed Grass beyond. Everything like a perceptible or continued line (much more a curved line) must be distinctly avoided in the appropriation of such materials. They should join the Grass in the most jagged and inartificial manner. Rockeries can be made to answer one or two simple purposes, which will impart meaning and spirit to them, and prevent them from becoming the expressionless and pointless things which they usually are. Where there are raised banks between one part of a garden and another, rocks can be employed to face the more private side of them, and will contribute to their solidity, at the same time that they increase their propriety and interest. If, again, a walk be cut through a bank, rocks may be used to hold up the sides of the opening, when steep. Or where a walk travels along a narrow hollow between two banks, the slopes of the banks can be partially covered with masses of rock. In both these last cases, a miniature and imperfect imitation of a small defile will be produced, and may be made very consistent and natural. The plan will be particularly serviceable where the hollow has to be made as narrow as possible, and the banks have, consequently, to be kept pretty upright. At any rate, such an arrangement will be infinitely preferable to having mere heaps of stones, thrown together without any apparent object beyond the simple creation of the mass. *Kemp, on Small Gardens.*

New Artichokes.—Some years ago M. Cochet, of Suines, in the department of the Seine and Marne, wishing to renew his stock of Artichokes, bought some seeds in Paris, which he sowed. The first two years he merely picked out of what he raised those plants which seemed to him to be the most remarkable, and these he propagated by their eyes. Last year he obtained some splendid Artichokes, one of them being much larger than that hereafter distinguished by No. 4. On the 23d of June last, I saw these plants at M. Cochet's establishment, where I also had the opportunity of tasting them; and I may truly say that I never before saw any Artichokes with so thick a bottom, and so much flesh at the base of their scales. I obtained from M. Cochet five varieties of his Artichokes, and of these I sent to the Societé d'Horticulture two specimens, one of which I consider very fine, and the other nothing extraordinary. The following account of these two plants may perhaps be interesting to your readers. No. 4 measured three quarters of a yard round, and weighed more than 2 lbs. The first three or four rows of scales were pretty open; the scales themselves very large, thick, pointed, mucronate, or slightly spiny; some of them had on their outside and near their base a violet tinge. The interior scales were more and more violet coloured, pointed, and spiny at their apex. No. 2 measured a little more than half a yard in circumference, and weighed more than a pound. Its external scales much less open and much closer to each other, gave this Artichoke a conical appearance; in other respects it resembled the first, and like it terminated in spines at its centre. Of the other varieties No. 3 measured nearly three quarters of a yard round, and weighed a little more than a pound. Its scales were not, even in the centre, very spiny. It was not very unlike the common Artichoke. No. 1 resembled No. 4, but the first four or five rows of scales were more open, and the scales themselves less obtuse and less sloping at the top. It measured more than three quarters of a yard in circumference, and weighed exactly 2 lbs. No. 5 was a small head, with scales almost imbricate, violet and spiny only near the centre. It weighed less than half a pound, and was decidedly inferior to the preceding. It may be as well to state that these plants do not grow so high as the Laon Artichokes, their average height being about three quarters of a yard. *Jacques, formerly chief gardener at Neuilly.*

Iron and Glass Buildings.—Permit me to suggest that an exhibition of designs for *ferrivitreous* edifices (to coin a word) in the Exhibition of 1851 would be appropriate. There can, I think, be little difference of opinion as to the effect the great exhibition will have in giving impetus to the construction of buildings of a like character. I think it probable that Russia, at least, will desire to possess something like, if not more extensive than, our glass building. The Emperor intends to visit it (it is said) in person. It is not beyond the compass of possibility that a structure of glass and iron will one day exhibit to the beholder the Flora of the universe, as the great glass case will the works of art of the whole world. Perhaps, too, it will share, on the opposite side of the river, the attention, the admiration, and the wonder of the visitor to the new Houses of Parliament. Raised on lofty arches, and towering higher than any glass-iron edifice yet constructed, such a building might be appropriately reared in the locality named. Be this as it may, I am desirous to impress the builder, and English architects in glass and iron with the "great fact," that there is wide scope for the display of artistic taste, skill, and genius, in this new kind of edification. *Builder.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

If our advice, given in February, with regard to striking a few cuttings of the charming little Otaheite Orange-trees, was attended to, the plants will now be set with buds, and perhaps a fruit or two may have set upon them during the season. Their flowering should be assisted by placing them in a very slight heat, as, by so doing, they will be very useful about Christmas for drawing-room decoration. A collection of dwarf Oranges in small pots is very ornamental at all times, but these are doubtless valuable at this season, when flowers are scarce. Ardisia crenulata and A. acuminata, are very much prized by us for the beauty of their berries. When there are many ornamental vases in the dwelling-rooms, to be filled with plants, things so easily grown make a very pretty variety, and help well to make out the required number. Dracæna terminalis is another useful plant for rooms, or for a warm conservatory, as its fine purpled crimson leaves are always admired; and by candlelight they are very beautiful. We also find that handsome specimens of tropical Ferns are greatly appreciated when placed in suitable vases. These are easily grown in the more shady parts of the plant-houses, where few other things would succeed; and they are really worth the small amount of attention they require.

FORCING DEPARTMENT.

Pineries.—It will be a trying task just now to manage these structures with no other heating material than fermenting litter. Every favourable opportunity should be taken to turn the linings, and add to them if required. Let them at least be protected by some kind of covering from the rain and snow; and if possible let them be entirely inclosed, that they may of themselves supply a sufficient amount of heat to do away with the necessity of keeping the pits covered during any portion of these very short days. Young Pines are frequently much drawn during winter, and the mischief is not noticed until they are taken out in the spring to be repotted or planted; and then it is that the gardener repents not having given more air, and more light, by keeping the glass clean. We have felt this ourselves, and no doubt others have done the same. If the bottom-heat is 80°, the top may be as low as 55° without the plants suffering; and particular care should be taken that no injury occurs from excessive dampness at the root from any cause. We seldom see plants suffering from being too dry during winter, unless the roots are too near a flue.

FLOWER GARDEN AND SHRUBBERIES.

The flowering of all the choicer kinds of Roses being now over, it will be well to place some light warm material, such as half decayed leaves, or sphagnum where plentiful, round their stems. Besides this, we stick in among the Tea Roses some short Yew branches to check the cold cutting winds, which do more harm in the early spring than even very severe frosts. The pruning and tying of creepers upon walls and trellises should be proceeded with. Take advantage of frosty weather, when the walks are hard, to convey fresh soil to the flower-beds; or for doing any kind of work in the flower garden and shrubbery which would damage the walks when not in a frozen state. In extensive gardens there is generally much heavy wheeling to do every winter, and no time is more favourable than during sharp frost. All plants of which any doubts are entertained as to their perfect hardiness, should have some kind of protection afforded them; but in doing this, care should be taken not to go into the opposite extreme.

HARDY FRUIT GARDEN.

If it be intended to graft any more young Apples or Pears, the scions should be gathered before the trees are pruned, and laid into the moist soil behind a north wall till they are required. They should of course be selected from the varieties which are found useful and best suited to the local peculiarities of soil or climate. Above all things, let the scions be taken from trees which are perfectly free from disease, and are not infested with the American blight or other similar pests, which are liable to be thus communicated to the young trees. Cuttings of Gooseberries and Currants should also be planted in nursery rows. Before the cuttings are inserted, all the embryo buds should be carefully picked away from the part which is to be placed in the ground. Proceed actively with the retraining of the fruit trees against the walls; and as soon as any portion is completed, let the covering be immediately applied; for it is not less necessary for the purposes of shade during the next two months, than it will be afterwards as a shelter.

FLORISTS' FLOWERS.

After the frosts we have lately had, it will be absolutely necessary to go over all beds where Pinks, Pansies, or Carnations have been recently planted. If they have not had time to establish themselves, most likely they will be loosened by the action of the frost; and if neglected till severe weather again takes place, they undoubtedly will be seriously injured. We prefer placing a small quantity of any soil round each plant, previous to fastening them again. Seedling Auriculas and Polyanthuses also should be carefully looked to in this particular; strong two years' seedlings of the former will often flower at this time of the year. On the expansion of the first pip, if they have no pretensions to beauty, or excellency of any kind, they may be pulled up; but if there is any sign or chance of amendment (as appearances are deceitful at this time of the year), pull the buds off, in order to give the plant a chance of strengthening itself, and producing a better truss the ensuing season.

State of the Weather near London, for the week ending Dec. 12, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Books: *G H.* "James's Gardening."

Carbonic Acid: *C A A L.* Plants will bear 5 per cent. of this air, in addition to what is natural; but they then require exposure to very bright light. Probably 1 or 2 per cent. is as much as it is safe to use. There is little more carbonic acid in a well ventilated sitting-room, with a chimney to it, than in the open air. Joyce's stove may be used in a greenhouse: but its action is so feeble that you will derive little benefit from it. As for carbonic acid, it evolves it in large quantities, as you may easily see if you hold a piece of lighted paper at the mouth of the chimney; the flame is immediately extinguished if there is much combustion; and without much combustion there can be little heat.

Conifers: *A Z.* Araucarias and Deodars seem indifferent to soil. We see them growing well in thin heathy soil on a burning gravel, and in the deep heavy London clay. They will probably be found to prefer a somewhat sandy soil. Give them no manure; but as much rotten leaf-mould as you like.

Fruit-room: *J A.* 40° is ample.

Insects: *George.* The leaves sent are covered with Oak spangles, some account of which will be found in our former volumes.

Luculia. *Inquirer.* Give it a *little* more heat, and it will flower with you. It blossoms beautifully, planted out in the bed of a conservatory; but, when in a pot, it likes a little more warmth than that of an ordinary greenhouse.‡

Names of Fruits: *W S.* The Chaumontel is in some cases ripe at this time; but the Jargonelle never keeps till now. Of the varieties you sent, the two not named were unknown.‖—*W S.* 1, Scarlet Pearmain; 2, 3, Dutch Mignonne; 8, King of the Pippins; 9, Reinette du Canada; 10, Scarlet Nonpareil; 11, Easter Pippin or French Crab; 11, Rhode Island Greening.‖—*J B Warren.* Napoléon.‖—*W P, St. Helen's.* Minchall Crab.‖

Names of Plants: *R H, Hall.* It is Geissomeria longiflora.—*Erzeroum.* 84, Hyoscyamus niger; 85, Hyosc. pinnatifidus.—*D S.* It is Victoria Regia.‡—*Inquirer.* Cacalia pinnata.‡—*A Well Wisher.* Celandine is Chelidonium majus; in Lindley's "Medical and Œconomical Botany" it is described as being "strong smelling, acrid, narcotic, emetic, poisonous. The juice used against warts and opacities of the cornea."—*W Parr.* Is it different from Miltonia Russelliana?

Pruning Fruit Trees: *C M S.* We believe there is no better book on the *practice* than the late Mr. Lindley's "Guide to the Orchard," &c. As to the theory of the matter, you will do well to consult D'Albret *Cours théorique et pratique de la taille des Arbres Fruitiers*, edit. 6, 1846.

Strawberries: *J H.* Cuthill's Black Prince is the earliest; if you want large fruit, then plant Keens' Seedling.‡

Trees: *Greenhorn.* Hardy trees will bear to have their roots frozen.

Misc. *A Subscriber's* suggestion will be taken into consideration, but we fear it is not practicable.—*Dymvio.* In order to have Grapes ripe in June, commence forcing about the middle of this month. Figs may be struck from cuttings, in heat, in January.‖

SEEDLING FLOWERS.

Chinese Primulas: *Cymro.* Being unprotected in any way, your blooms were quite spoiled in coming through the post.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

FURZE MACHINE.

COTTAM AND HALLEN have now brought to perfection FIRCHILD'S PATENT FURZE CUTTER AND BRUISER, for the preparing of Furze for Feeding Horses and Cattle. The Machine may be worked by horse-power, and will cut and bruise at the rate of 20 bushels per hour with one horse, a man, and boy; with two horses, 40 bushels per hour; if a steam-engine, in proportion to the power applied. The Machine is now on view at COTTAM AND HALLEN'S, No. 2, Winsley-street, Oxford-street, where every other description of Agricultural Machinery may be seen.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.
Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to carties known to the firm at either of the above-named places.

The Agricultural Gazette.

SATURDAY, DECEMBER 14, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 18—Agricultural Society of England.
THURSDAY, — 19—Agricultural Imp. Society of Ireland.
THURSDAY, — 26—Agricultural Imp. Society of Ireland.

A LARGE portion of our space is this day occupied with reports of the great CATTLE SHOWS of the past week; and, having obtained measurements of all the cattle exhibited at each, from which some useful inferences may be drawn, we shall devote our leading column to a similar purpose. It is not so much the relative merits of the Smithfield and Midland Counties' clubs—though that is no doubt a point of some interest—as the relative merits of the different breeds of cattle, which each has exhibited, that we wish to bring out. The prize lists, in some measure, indicate this point, more especially in the case of the Smithfield club, where all breeds compete with one another, the classes being according to age; not so much in the case of the Birmingham show, where all ages compete with one another, the Classes being according to breed. We retain the opinion expressed on a previous occasion that the former is the more useful method of classification for a show of fat stock, and that the positive unfairness to an exhibitor of pitting his three years old ox against animals of the same breed four and five years of age, is at least as unfortunate a result of the one mode of arrangement, as the *chance* of unfairness which he incurs under the other, by the partialities or prejudices of the judges, when his animal is pitted against others of the same age, but of different breeds. On this point, however, we need not now insist; it is, perhaps, well that each Association should, for individuality's sake, retain its peculiar mode of classification, so that exhibitors may choose which kind of risk they shall incur. Certainly, the result of this year's shows has not in any degree determined the relative popularity of the two, for both Societies have prospered far beyond the experience of former years.

The prizes of the Smithfield Club were awarded as follows:—Three *first* prizes, besides medals; five *second* prizes; two *third* prizes, and the gold medal for the best cow in the yard, were won by the short-horns: two *first* prizes, besides medals; one *second*, and one *third* prize, with the gold medal for the best ox in the yard, were received by the Herefords; two, *first*, and one *second* prizes were awarded to the Devons; and one *first* prize was gained by one of the Scotch breeds. In all, it appears that 160*l.*, besides medals, were awarded to short-horns; 65*l.* to Herefords, 50*l.* to Devon, and 10*l.* to one of the Scotch breeds; but, then, excluding extra stock, 75 short-horns were shown, and only 26 Herefords, and 29 Devons. The prizes awarded would, therefore, average 2*l.* 2*s.* per head for the short-horns; 2*l.* 8*s.* for the Herefords, and 1*l.* 15*s.* for the Devons—thus somewhat altering the order of merit in which the breeds might at first appear to have stood. The following table gives the dimensions and weight of the prize animals according to Carey's cattle guage, which is understood to indicate weights below the truth in the case of very fat cattle.

																													4 9	7 0	56

There are one or two other points which this table teaches: thus, as regards the Birmingham show, it appears that in the case of short-horns, one of the younger oxen carried off the first prize in its class; in the Herefords the first was carried off by one of the older, and the second by one of the younger oxen; and in the Devons both the first and second were won by animals of full age—thus keeping true to what is generally understood to be the order of the breeds as regards early attainment of maturity. We learn from it, too, that the classification of cattle according to weight which obtains in certain cases at Smithfield, cannot be well carried out—the first prizes in both those cases being carried off by animals which, according to the measurements and the terms in which the classes are described, would appear to have been disqualified for competition. And lastly, on comparing it with the next tables, which give the average weights and dimensions of the different classes at each show,* we learn the effect of mere bulk and weight as compared with symmetry on the minds of the judges. Thus, as any one who will examine these tables may find for himself, it appears that at Smithfield one *first* prize, four *second* prizes, and two *third* prizes, were awarded to animals whose weight was *below* the average of their respective classes; and in three different classes the first prize was awarded to animals of less weight than those which carried off the second; and it may, perhaps, interest some of our readers to examine these tables in search of further proof which they will readily find, and which any one who may have witnessed the exhibition itself, whether at Birmingham or London, must at once have seen that *mere* size and weight is not regarded a property of any value in an enlightened judgment of the merits of our different breeds of cattle.

There are many other particulars which may be drawn from these tables; as, for instance, when numbers were shown sufficient to give trustworthy averages, the relative rapidity of growth in the different breeds, the average increase of weight in the 3d, 4th, and 5th years of the short-horned, Hereford, and Devon breeds respectively. And at p. 137 of our this year's volume, an attempt will be found to

* The cattle of the Midland Counties' Show had to be rearranged according to the Smithfield mode, which was done from the particulars of age, &c., given in the Catalogue.

bring a similar set of figures to bear upon this point. And those who choose to subject the figures given in these tables to a similar analysis, will find that they will yield very similar results. The short-horns appear to attain an earlier maturity than the others; their growth is more rapid at an earlier stage, and less rapid at a later stage, than that of the Herefords or Devons; but we refrain from pushing our criticism any farther at present. The tables will enable any one who may desire it, to do so for himself.

The relative merits of the two exhibitions will also appear in these figures, as any one may see; but we need not carry the examination into this particular. The old Metropolitan Society has, of course, far higher *prestige* on its side than the young Country Association, and its superiority for many years to come is to be expected. We think both Mr. Gibbs, of the Smithfield Club, and Mr. Wright, of the Midland Counties Association, have ample claims on our thanks, and ample grounds for self-gratulation, in the success of their respective efforts.

FEEDING ON OPEN BOARDED FLOORS.

Experience ought to make us all wise. In any case it is useful, so I communicate mine on the above subject. In my last communication I said my arrangements as regards the boarding were—

	Wide. Inches.	Thick. Inches.	Opening. Inches.
For bullocks	3	2	2
For sheep and pigs	3	1½	1½
For small down lambs and pigs ...	3	1½	1

Those arrangements are still satisfactory, except for heavy bullocks; when they arrive at 700 to 1000 lbs. butcher's weight, the boards are not thick or strong enough. They have occasionally broken one, without injury, however, to the animal. I also find that they wear the edges of the boards rounding; I would, therefore, recommend straight grained hard wood, 4 inches wide, 3 inches thick, the openings to be 17 eighths, or full 2 inches. My original boards still answer, but it is better to make all safe. Nothing seems to answer better as a bearer than 4½ inch brick-work with a lentil, at intervals of about 5 feet. The pits under the bullocks should be at least 4 feet deep, otherwise they get full before you want the manure. The manure should never be allowed to stand level with the boards; it softens and weakens them. If the bullocks are tied up, the manure will want levelling occasionally. Pig and sheep pits need not be more than 2 feet deep; they will scarcely fill in six months.

There is nothing offensive in the beef pudding, for if I do not use fixers, still there is no disagreeable smell, *until you empty it*. This is more than I can say for the pigs. Of course I recommend and use fixers.

I have just got a ton of Irish peat charcoal kindly sent me by a friend of the cause; no doubt it will be useful, if not too expensive. I am also trying Lawes's dissolved coprolites. I have used gypsum with advantage, but am more particularly attached to common salt, which I have used extensively. We buy it in the neighbourhood at 30*s*. per ton. I believe it gives us in decomposition muriate of ammonia and carbonate of soda, both most valuable salts. It is certainly a great purifier. By the bye, I always give my bullocks and other animals salt, about 2 oz. per diem; sheep and calves in proportion. It loosens their skins.

I am perfectly satisfied that the open floor system answers well, and is a great boon to a heavy land farmer, who wishes to keep much stock and not have to buy straw. There is an immense economy in labour; the animals are always clean without any sweeping of the floors, and they are very healthy. I really think I shall soon convert even my friend the Rev. G. Wilkins. It is such a compost to take out—a nice lot of pudding without the intervention of a dunghill or second carting, and apply it forthwith to the growth of plants; they are all truly grateful for it. I have at present on boards:

200 pigs—one man at 9*s*. per week attends to them.
30 bullocks—one lad at 3*s*. 6*d*. per week attends to them.
10 cows } one lad at 3*s*. per week attends to them, and par-
150 sheep } tially by bailiff.
60 calves—one boy at 4*s*. per week.
Another lad at 3*s*. 6*d*. cuts Turnips half the day, and grooms the bullocks and cows every morning.

It is quite clear that if these animals were to be littered with straw, much more labour would be required, and more manure to move.

Slated roofs do not answer, unless boarded under the rafters. Mine are so done. Slates conduct heat to the animals in summer, and from them in winter.

Animals on boarded floors, during winter, require to be kept warm. I pack them rather close; if Herefords two in a box, 9 feet by 8. I mean clear of the feeding trough and passage. Smaller polled Scots three in a box; in fact, about 30 to 40 superficial feet to each bullock; 8 to 10 feet for sheep and pigs. Beware and have good supports for fat hogs. A score of them in a corner are no light weight. Taking the balance of advantage, I give my vote to open-boarded floors. Some of my cows have calved on them, and done well. Still I am not advocating them for breeding animals. Young pigs soon fat on them; they cannot run about. Heavy pigs get capped hocks occasionally. Perhaps I may revert to the subject when time permits. My straw is now set free for cooking, mixed with meal or ground cake into a pudding, and given, as Mr. M'Culloch does, to bullocks, &c., eating Turnips. *J. J. Mechi, Nov.* 16.

Home Correspondence.

Inclination of Drains.—A late correspondent of the *Gardeners' Chronicle* inquires what is the smallest declivity admissible? I am enabled to tell him that I succeeded in the perfect drainage, 7 years ago, of a 9 acre field of extremely flat clay-land, with a declivity of ⅛ of an inch to each 4 yards (or length of the parallel level rule). It was, of course, conducted with the greatest care and accuracy, and the constant application of the levels. The levels of the surface were first taken. The depths of the main row below the surface of the ground, at each 40 yards, were calculated to test the accuracy of the execution. A bit of wood ⅛ inch thick being nailed on the edge of the "long rule" at the *lower* end, the spirit level, laid on the "rule" in the bottom of the drain as each stretch was cleared out, indicated at once the accuracy of the incline. That of the small drains, 18 feet apart, was executed at the same rate and in the same manner, and the drainage, as I have said, is perfect. The material was horse-shoe tile on soles, covered with 4 inches of small broken stones blinded with a slight covering of fallen Oak leaves, over which 4 inches of the stiffest of the soil was shovelled in, levelled, broken fine, and trodden by the man working forwards. These operations being done quickly and consecutively, the remainder of the earth was at leisure returned in successive layers of 8 or 10 inches slightly trodden. *J. S. H.*

Liquid Manure.—Your remarks in a recent *Gazette*, in reference to the prevailing epidemic of liquid manure, anticipated similar observations which we had contemplated offering to the notice of your readers from week to week. The notions promulgated on this subject, and the enormous expense incurred in some instances within our knowledge, are almost as mischievous as the waste in which they originated. It does not follow, from some careless farmers having allowed the fluid from their yards to poison their ponds, or run to waste in ditches, that it is either necessary or profitable to form conduits to expensive tanks, and to convey them by expensive means to the fields. In the course of a journey some months ago a huge brick tower, apparently about 60 feet high, arrested our attention; and on inquiry we found it was a portion of farm buildings on which a great outlay was going on. We could not conceive to what agricultural purposes such a structure could be applicable, and accordingly went to gratify our curiosity. We found abundance of accommodation of stock of all descriptions; but, fortunately, no stock in them, though at the period of the year in which such buildings are usually full, for cattle must have been thoroughly starved from the currents of wind which penetrated in all directions from which there was very insufficient shelter. Matters were so contrived that, instead of permitting any absorption of the fluids made by the animals, they were conducted to large tanks. From these the contents were pumped by a steam-engine into a large iron reservoir, placed on the top of the brick tower, from which we were informed it was to be conveyed by pipes over the estate. The quantity of machinery involved in the collection and hoisting to the reservoir was perfectly perplexing. We observed to the bailiff, we presumed there was a resident engineer on the establishment, and he replied there was generally one about. We were assured the owner was a very rich man, but that he did not personally interest himself much about farming. We fancied that if one year's interest on the outlay we saw had been applied to converting the stalls into boxes, and inclosing them, these fluids would have become infinitely more productive than they will ever be practically made with all this outlay. What can be more simple, effective, and economical than the box system, whether as respects feeding or manuring, so long as the excretæ of animals shall be devoted to the latter purpose? Everything is preserved in intimate union, and removed without any intermediate conduits, tanks, or machinery, direct to the field when required, or to a heap, to be covered with earth till it is required. We consider the crops thus obtain their liquid manure in the best form possible; for by means of the moisture in the land, the solution is gradual, and a moderate supply of food is thus provided to the roots of plants for a long continuance. We cannot too strongly urge forming the heaps when the manure is not immediately wanted for the land in a triangular shape, to facilitate the entire coating of them with earth as soon as found; for we find that materially checks, if it do not actually stop fermentation. We have just carted a heap that was put together after we had finished Turnip sowing in June, and which was carefully covered; and a short depth from the surface it appeared exactly in the same state as when removed from the boxes. We are quite aware that different opinions exist as to the value of fermented and decomposed manure, as compared with that which has been decomposed prior to its deposit in the land. We apprehend these doubts can have arisen only with reference to the immediate influence on the particular crop; roots for instance which feed heartily on carbonaceous food; but surely these doubts have no foundation when the wants of the succeeding crops in the rotation are borne in mind, and which require all the elements of nutrition which are disengaged in the process of decomposition, and which we now learn from the interesting experiments of Professor Way are appropriated by the soil when disengaged within it, and these safely detained. This discovery removes the objections previously held to autumnal manuring for the spring crops; and as it would seem nothing would be thereby lost, this course would be judicious, inasmuch as the intermediate decomposition would render the manure applicable to the root crop more readily available—without any resulting loss of elements which supply food to the succeeding crops. *C. L., Cirencester, Dec.* 3.

Manure.—Fresh manure may be preferable in some instances, for dressing land, in comparison to that which has been fermented in the dung heap. But how is it possible, where a great extent of arable requires immediate manuring, and ploughing in for a crop, to use nothing but soil taken direct from the stables or cow-sheds? Let us imagine a Wheat stubble of some 30 acres, ready to receive muck over its whole surface, preparatory to being turned over, and converted into a fine tilth for the reception of seed; how could any farmer keeping the largest stock have sufficient fresh manure to cover such an extent? requiring 700 or 800 loads to do it properly. Great attention is necessary in making a manure heap, and by a little foresight many of the valuable properties of dung may be preserved. On every holding, whether large or small, road-scrapings, sand, charred materials, and ashes, should be collected in all seasons, and when the cattle sheds and buildings are cleaned out, the tops of the refuse should be covered 6 inches deep with the dry stuff, to prevent the escape of valuable plant food, which goes off during fermentation. Whenever an additional supply is received from the animals fatting, it should be smothered in the same manner. A tank should be built near at hand to catch the liquid, which may be poured upon the heaps three or four days before carting it on to the land. In this way manure might be much improved, without any great increase of labour. Economy in farming must be the order of the day. Ingenuity, contrivance, and industry should be called in, instead of expensive buildings, which swallow up the profits of many years. Agriculturists must gradually feel their way, and not jump at conclusions, without experimenting first on a small scale. A man may be over-housed, and a farmer ruined by costly out-houses, and new inventions. *Falcon.*

Smithfield Market.—The evils connected with Smithfield market are many and various, and sufficient in themselves to condemn the place, as a school for every species of profligacy and vice—apart from the brutal usage of the poor animals doomed to provide food for the metropolis. To youths it offers a dangerous excitement; they experience pleasure in witnessing the violent exertions of the drovers to keep their flocks together, not by gentle and kind treatment, but by curses loud and deep, followed by blows upon the bodies of the unfortunate beasts, whose strenuous efforts to escape the bludgeons of their ferocious torturers afford amusement to the ignorant and uneducated, many of whom, mere children, do not lose sight of their victims till they fall under the butcher's knife. The repetition of such sights can only harden the feelings of the young, and accustom them to scenes of barbarity. Can anything be more disgusting, or tend more to demoralise the lower orders, than the common occurrences which take place in the neighbourhood of Smithfield market? Worthy persons expatiate upon the necessity of converting heathen nations, and the duty incumbent upon a Christian country to send missionaries to our possessions abroad. But, really, if we look at home, we shall find we require as much assistance and instruction as the most benighted quarters of the globe. To prove the truth of this assertion, let any one visit Smithfield, at stated times, when business is going on, and he will be horrified to witness the rioting, drunkenness, and debauchery prevailing; to the destruction of every right principle, and to the everlasting disgrace of the richest city in the world, the capital of Christianity. To make matters worse, there is no necessity for continuing this Pandemonium, but its removal to a more salubrious and open locality would be a gain to the community at large in point of health, money, and common decency. No wonder salesmen cannot afford to give farmers a fair price for stock driven into Smithfield market, when the casualties are so great, many animals being injured after entering the streets of London. Neither can we be surprised at the difference in value, between meat sold in the carcase, and that retailed in the shops, when we recollect the bruises the sheep and oxen receive before they reach the slaughter-house. Smithfield should, and must be erased from the map of London, before many months elapse, for the following reasons: It causes the destruction of much valuable food; it promotes disease, by encouraging the sale of bad meat; it depreciates the value of farming stock, and is opposed to the golden rule, "The merciful man is merciful to his beast." *Falcon.*

Societies.

SHOW OF THE SMITHFIELD FAT CATTLE CLUB.

The pleasure is sincere, and the satisfaction unmingled with which we make a yearly notice of the above-named exhibition of fat animals, that has now been established for half a century, and which has most unquestionably proved a very powerful stimulus in advancing the animal branch of rural economy. It has been most justly observed, that nearly all improvements in the advancing progress of the human race have proceeded from congregations of men, that were temporary or permanent, where traffic and freedom exert their legitimate influence in producing the mild

tone of manners, and in dispelling the boastful air of superiority, and the arrogance of conceit. The footing of equality makes known the mutual possessions and wants which attend every stage and condition of existence, and produces the interchange and adoption, which promote the mutual benefit. It also tends very powerfully to remove the animosity of rival classes, and lays open the mutual dependence and reciprocal affection of every grade of the community. The towns are the stimulus and support of every practical art—the two branches of commerce and agriculture must wax and wane together—it cannot be well with the one, and ill with the other, nor can either be flourishing and the other retrograding. Commerce being the market of agricultural produce, must of necessity be thriving, in order to stimulate the cultivation of the land, in order to supply its wants. Knowledge acquired at such general exhibitions is not worn out by use, as are clothes or material substances — but is rather augmented and perfected, and is corrected by passing through the minds of millions. The elements being made acceptable to all, will be more thoroughly examined, and more effectually developed in the consequences, and receive that ductile and plastic quality which the action of minds constantly moulding them to their own purposes can alone bestow.

These remarks apply with much force to the present exhibition, which brings together practitioners in many arts, and the votaries of many callings, and where they can indulge their curiosity in numberless observations, and obtain ample materials for reflection. General prejudices are thus removed, which have separated nations and people much more effectually than the broadest rivers, and the loftiest mountains, which nature has formed. Intercourse is one of the most powerful links that cement society.

The show of this year was opened on the usual day of the week and month, beginning on Tuesday, the 10th, and ending on Friday, 13th, of the present month, and in the same place of the western metropolis. It was a good alteration of last year, to end on Friday instead of Saturday, as it prevents any encroachments on the Sunday, in removing the cattle to their destinations. The interior arrangement was very much improved by the enlargement of the space allowed for the sheep and pigs, and a double row of beasts occupied the front part of the standing usually given to the sheep. The general view was very much improved, and the sheep and pigs were seen to greater advantage than in former years. The lighting by gas was bright as usual, and even exceeds the light of day in the showing the various articles exhibited. The reporters of the press were favoured with a ticket of admission for a private view on the evening of Monday, after the judges had finally concluded their labours. This kindness would be very much enhanced by the ticket admitting the reporters during the four days of the show without charge. But the private view on Monday evening is very commodious, as a leisure is given for examination, free of the bustle and crowd of the public days.

The prizes were awarded as follows :—

CLASS I.

Oxen or Steers, of any breed, above 4 and not exceeding 5 years old, without restrictions as to feeding; yet the kind or kinds of food must be certified.—1st prize of 30*l.*, and Silver Medal to the breeder. To Mr. John Tucker, of Staplegrove, near Taunton, Somerset, for a 4 years and 9 months old Devon ox, bred by Mr. Priscott, of Staplegrove, and fed on Grass, hay, Turnips, Barley, and Peas.—2d, 15*l.*, to Mr. Joseph Philips, of Ardington, near Wantage, Berks, for a 4 years and 1 month old Hereford ox, bred by Mr. J. S. Edwards, of Stanton Lacy, near Ludlow, and fed on meal, Swedes, and hay.—3d, 5*l.*, to his Grace the Duke of Richmond, Goodwood, near Chichester, Sussex, for a 4 years and 1 month old Hereford ox, bred by Mr. Rogers, of Ledicot, and fed on oilcake, Carrots, Turnips, Swedes, hay, and Grass.

CLASS II.

Oxen or Steers, of any breed, above 3 and not exceeding 4 years old, without restrictions as to feeding; yet the kind or kinds of food must be certified.—1st prize of 30*l.*, and Silver Medal to the breeder. To the Right Hon. the Earl of Hardwicke, of Wimpole, near Arrington, Cambridge, for a 3 years and 10 months old Durham ox, bred by his lordship, and fed on Beans, and Barley-meal, and hay.—2d, 15*l.*, to Mr. Henry Frampton, of Farringdon-road, Farringdon, Berks, for a 3 years and 9 months old Durham steer, bred by Mr. Thomas Eeles, of Cottage Farm, near Northleach, Gloucestershire, and fed on oil-cake, Barley-meal, steamed Turnips, Mangold Wurzel, and hay.—3d, 5*l.*, to the most Hon. the Marquis of Northampton, of Castle Ashby, near Northampton, for a 3 years and 10 months old short-horned steer, bred by his lordship, and fed on Grass, hay, Turnips, Beet, Cabbages, Carrots, cake, and meal.

CLASS III.

Oxen or Steers of any breed, above 2 years, and not exceeding 3 years old, without restrictions as to feeding; yet the kind or kinds of food must be certified.—1st prize of 25*l.*, and Silver Medal to the breeder, and the Gold Medal, being the best beast in the 1st, 2d, 3d, 4th, 5th, and 6th classes, to Mr. Wm. Heath, of Ludham, near Norwich, Norfolk, for a 2 years and 10 months old Hereford ox, bred by Mr. James Bill, of Whitaway Head, near Ludlow, Salop, and fed on Grass, hay, Turnips, oil-cake, Oat and Pea-meal.—2d, 15*l.*, to Mr. J. L. Bult, of Dodhill, Kingston, near Taunton, Somerset, for a 3 years old improved short-horn steer, bred by himself, and fed on hay, Grass, roots, Barley, and Bean-meal.—3d, 5*l.*, to Mr. James Clover, of Creeting St. Mary, near Needham-market, Suffolk, for a 2 years and 11 months old short-horned ox, bred by himself, and fed on Clover, hay, Turnips, Carrots, Cabbages, oil-cake, and Bean-meal.

CLASS IV.

Oxen and Steers of any breed and age, above 80 stones, and under 95 stones in weight, without restrictions as to feeding, yet the kind or kinds of food must be certified.—1st prize of 20*l.* and Silver Medal to the breeder. To his Royal Highness Prince Albert, for a 3 years and 9 months old Hereford ox, bred by Mr. Thomas Sheriff, of Buckton, near Ludlow, Hereford, and fed on cake, meal, hay, and roots.—2d, 10*l.*, to Mr. James S. Bult, of Dodhill, Kingston, near Taunton, Somerset, for a 3 years old improved short-horned steer, bred by himself, from the stock of the Rev. Henry Berry, and fed on hay, Grass, roots, and Barley and Bean-meal.

CLASS V.

Oxen or Steers of any breed or age, not exceeding 80 stones in weight, without restrictions as to feeding, yet the kind or kinds of food must be certified.—1st prize of 15*l.*, and Silver Medal to the breeder. To the Right Hon. the Earl of Aylesford, of Packington, near Coventry, Warwick, for a 3 years and 11 months old North Devon ox, bred by his lordship, and fed on Grass, Vetches, Clover, hay, Turnips, Beet, cake, Barley, Beans, Pea-meal, and Linseed.—2d, 5*l.*, to Mr. Thomas Bond, of Bishop's Lydeard, near Taunton, Somerset, for a 3 years and 8 months old Devon steer, bred by himself, and fed on hay, Grass, roots, Beans, Barley-meal, and Flax seed.

CLASS VI.

Oxen or Steers of the Scotch, Welch, or Irish (Kerry) breed, of any age, without restrictions as to feeding, yet the kind or kinds of food must be certified.—The prize of 10*l.*, to Mr. William Heath, of Ludham, near Norwich, Norfolk, for a Galloway Scotch ox, about 4 years old, breeder unknown, and fed on Grass, hay, Turnips, oilcake, Oat and Pea-meal.

CLASS VII.

Cows or Heifers under 5 years old, without restrictions as to feeding, yet the kind or kinds of food must be certified. Spayed heifers are not qualified.—1st prize of 20*l.*, and the Silver Medal to the breeder. To the Right Hon. Lord Feversham, of Duncombe-park, near Helmsley, York, for a 3 years and 3 months old pure short-horned heifer, bred by his lordship, and fed on hay, Turnips, Bean-meal, and oilcake.—2d, 10*l.*, to Mr. Stephen Gooch, of Honingham, near Norwich, Norfolk, for a 3 years and 10 months old short-horned heifer, bred by Mr. Charles Brookes, of Leake, Boston, and fed on Linseed and Barley-meal, hay, Turnips, and Mangold Wurzel.—3d, 5*l.*, to his Royal Highness Prince Albert, for a 4 years and 6 months old short-horned cow, bred by Mr. Thomas Garne, of Broadmoor, near Northleach, Gloucester, and fed on cake, meal, roots, and hay.

CLASS VIII.

Fattened Cows, of 5 years old and upwards, without restructions as to feeding, yet the kind or kinds of food must be certified. Freemartins and spayed heifers are not qualified.—1st prize of 20*l.*, and Silver Medal to the breeder, and Gold Medal as the best Cow or Heifer in the 7th, 8th, and 9th Classes. To Mr. Stephen Gooch, of Honingham, near Norwich, Norfolk, for a 5 years and 3 months old short-horned cow, bred by Mr. Nathaniel Cartwright, of Hougham, near Louth, Lincoln, and fed on Linseed-cake, Linseed and Barley-meal, Mangold Wurzel, Turnips, and hay.—2d, 10*l.*, to Mr. John Henry Gurney, of Easton, near Norwich, Norfolk, for a 5 years and 7 months old short-horned cow, bred by John Emmerson, of Evyholme, near Darlington, York, and fed on Linseed-cake, Bean-meal, hay, Swedes, Beet, and Barley-meal.

CLASS IX.

Fattened Cows, of 5 years old and upwards, that shall have had at least two live calves at separate births, without restrictions as to feeding, yet the kind or kinds of food must be certified.—First prize of 20*l.*, and the Silver Medal to the breeder. To Mr. Thomas Aveling, of March, Isle of Ely, Cambridge, for a 5 years and 2 months old Durham cow, bred by himself, and fed on Linseed-cake, hay, and Mangold Wurzel.—2d, 10*l.*, to Mr. William Woodward, of Bredon's Norton, near Tewkesbury, for a 6 years and 8 months old improved short-horned cow, bred by himself, and fed on Grass, hay, green Clover, Barley, and Pea-meal.

EXTRA STOCK.—CATTLE.

The Silver Medal to Mr. W. Gooch, of Honingham, near Norwich, for a 5 years and 3 months old short-horned ox, bred by Mr. Charles Brookes, of Boothby, near Spilsby, Lincoln, and fed on Linseed-cake and Barley-meal, Mangold Wurzel, Turnips, and hay.

CLASS X.—SHEEP.

Fat Wether Sheep, of any long-woolled breed, 1 year old, without restrictions as to feeding.—1st prize of 20*l.*, and Silver Medal to the breeder, and the Gold Medal as the best pen of long-woolled sheep in the 10th, 11th, and 12th Classes. To Mr. G. S. Foljambe, of Osberton Hall, near Worksop, Nottingham, for a pen of three 20 months old Leicester wethers, bred by himself.—2d, 10*l.*, to the Most Noble the Marquis of Exeter, of Burleigh House, near Stamford, Lincoln, for a pen of three 21 months old long-woolled Leicester wethers, bred by his lordship from the stock of the Earl of Talbot and the Marquis of Exeter.—3d, 5*l.*, to Mr. John Shepherd Cranfield, of Harrowden, in Bedfordshire, for a pen of three 20 months old long-woolled Leicester wethers, bred by himself, from the stock of Mr. Ebenezer Peacock, of Wilhamstead.

CLASS XI.

Fat Wether Sheep, of any long-woolled breed, 1 year old, without restrictions as to feeding; each sheep not to exceed 220 lbs. live weight.—1st prize of 20*l.*, and Silver Medal to the breeder. To the Most Noble the Marquis of Exeter, K.G., of Burleigh House, near Stamford, Lincoln, for a pen of three 21 months old long-wolled Leicester wethers, bred by his lordship, from the stock of Earl Talbot and the Marquis of Exeter.—2d, 10*l.*, to Mr. Thomas Twitchell, of Wellington, near Bedford, for a pen of three 21 months old Leicester wethers, bred by himself, from the stock of Mr. S. Bennett, of Bickerings Park, Beds.—3d, 5*l.*, to Mr. Richard Newman, of Harrowden, near Bedford, for a pen of three 21 months old long-woolled Leicester wethers, bred by himself, from the stock of Mr. S. Bennett, of Bickering Park, near Woburn.

CLASS XII.

Fat Wether Sheep, of any long-woolled breed (not Leicesters), 1 year old, without restrictions as to feeding.—Prize, 10*l.*; and the Silver Medal to the breeder. To Mr. Robert Beman, of Moreton-in-the-Marsh, Gloucester, for a pen of three 21 months old Cotswold wethers, bred by himself.

Extra Sheep: Long-woolled Sheep.—Silver Medal. To the Most Noble the Marquis of Exeter, K.G., of Burleigh-house, near Stamford, Lincoln, for a 33 months old long-woolled Leicester ewe, bred by his Lordship from the stock of Mr. Sanday.

CLASS XIII.

Long and Short-woolled, Cross-bred, Fat Wether Sheep, 1 year old, without restrictions as to feeding.—1st prize of 20*l.*, and Silver Medal to the breeder. To Mr. John Robert Overman, of Burnham-Sutton, near Burnham-market, Norfolk, for a pen of three 20 months old Down and Leicester wethers, bred by himself from the stock of Mr. H. Aylmer, of West Dereham, Norfolk.—2d, 5*l.* To Mr. John Hitcham, of Little Milton, near Wheatley, Oxford, for a pen of three 21½ months old long and short-woolled wethers, bred by himself.

CLASS XIV.

Long and Short-woolled, Cross-bred, Fat Wether Sheep, 1 year old, without restrictions as to feeding. Each Sheep not to exceed 220 lbs. live weight.—Prize, 10*l.*; and the Silver Medal to the breeder. To Mr. J. R. Overman, of Burnham-Sutton, near Burnham-market, Norfolk, for a pen of three 20 months old Down and Leicester wethers, bred by himself from the stock of Mr. H. Aylmer.

CLASS XV.

Fat Wether Sheep, of any short-woolled breed, 1 year old, without restrictions as to feeding.—1st prize of 20*l.*, and Silver Medal to the breeder, and Gold Medal, as the best pen of short-woolled sheep, in the 15th, 16th, and 18th Classes. To Mr. John Williams, of Bucklaud, near Farringdon, Berks, for a pen of three 20 months old Southdown wethers, bred by himself.—2d, 10*l.*, to His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 21 months old Southdown wethers, bred by his Grace.

CLASS XVI.

Fat Wether Sheep, of any short-woolled breed, 1 year old, without restrictions as to feeding, each sheep not to exceed 200 lbs. live weight.—Prize, 10*l.*, and the Silver Medal to the breeder. To His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 21 months old Southdown wethers, bred by his Grace.

CLASS XVII.

Fat Wether Sheep, of any short-woolled breed, 2 years old, without restrictions as to feeding.—1st prize of 20*l.*, and Silver Medal to the breeder. To Mr. John Villiers Shelley, of Maresfield-park, near Maresfield, Sussex, for a pen of three 32 months old Southdown wethers, bred by himself.—2d, 5*l.*, to His Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a pen of three 33 months old Southdown wethers, bred by his Grace.

CLASS XVIII.

Fat Wether Sheep, of any short-woolled breed (not Southdowns), 1 year old, without restrictions as to feeding. Prize withheld.

Extra Stock: Short-woolled Sheep.—Silver Medal to his Grace the Duke of Richmond, of Goodwood, near Chichester, Sussex, for a 21 months old Southdown wether, bred by his Grace.

CLASS XIX.—PIGS.

Pigs of any breed, above 13 and not exceeding 26 weeks old.—1st Prize of 10*l.*, and Silver Medal to the breeder. To Mr. William Fisher Hobbs, of Boxted Lodge, near Colchester, Essex, for a pen of three 19 weeks and 6 days old improved Essex pigs, bred by himself, and fed on Cabbages, Potatoes, Mangold Wurzel, corn, meal, and milk.—2d, 5*l.*, to Mr. William Barber, of Langley Broom, near Slough, Bucks, for a pen of three 21 weeks and 2 days old improved Middlesex pigs, bred by himself, and fed on middlings, Barley, Pea-meal, and Potatoes.

CLASS XX.

Pigs of any breed, above 26 and not exceeding 52 weeks old.—1st Prize of 10*l.*, and Silver Medal to the breeder, and Gold Medal, as the best pen of pigs in the 19th, 20th, and 21st Classes. To Mr. John Coate, of Hammoon, near Blandford, Dorset, for a pen of three 28 weeks and 6 days old improved Dorset pigs, bred by himself, and fed on whey, Grass, and Barley-meal.—2d, 5*l.*, to his Royal Highness Prince Albert, for a pen of three 38 weeks and 6 days old Yorkshire pigs, bred by his Royal Highness, and fed on meal and milk.

CLASS XXI.

Pigs of any breed, above 12 and under 18 months old.—The Prize of 5*l.*, and the Silver Medal to the breeder. To the Right Hon. the Earl of Radnor, of Coleshill, near Coleshill, Berks, for a pen of three 52 weeks and 3 days old Coleshill pigs, bred by his Lordship, and fed on Barley-meal, Pollard, Potatoes, and whey.

Extra Stock: Pigs.—The Silver Medal. To Mr. William Barber, of Langley Broom, near Slough, Bucks, for a 45 weeks and 4 days old improved Middlesex pig, bred by himself, and fed on middlings, Barley, Pea and Rye-meal, and Potatoes.

The winner of the gold medal in the cattle department was an ox of the new Hereford breed, which attracted much attention, and obtained a very justly placed approbation. The carcase was most symmetrical, of the medium size, level, and well spread. The ribs were very beautifully covered with usefully fattened flesh, and no oily secretions. The shoulder has been seen covered more evenly—the point was bare, and the fault extended upwards. The buttocks were deep and wide, the flank protuberant, and the hook bones well covered with flesh. The twist wide, legs well set, and the bone of proper strength. The countenance very placid, muzzle wide and short, and horns of the medium length. The tail hung very perpendicular, being, in the fineness of it, a very sure mark of the organisation being refined. The back was very level, the shoulder well rounded on the top, and the set of the tail level with the back.

During the 20 years of our attendance at this show of fat cattle, we do not recollect seeing any animal of the same weight in the comparatively small compass. And we believe this opinion was universal. The carcase suited the proper feeding of animals—the whole flesh inspissated and traversed by fat, without forming useless bumps and secretions. With the exception of the bareness on the low fore point of the shoulder, a fault was invisible.

The first prize of the short-horned breed went to Earl Hardwicke, in an ox bred and fed by his lordship, and an animal of very superior merit. The carcase was heavy and fleshy, low, and hanging downwards, rather than cylindrical. The horn was unusually long for the breed, and the legs coarse in the bone. The back was very level, and the shoulders well covered with flesh. The fault lay in the slackness behind the shoulders, and the width from the short rib to the hook-bone. The deep belly showed an undue proportion of offal. Withal, the specimen was very good.

The first prize in Class I. went to a Devon ox of very superior merit. The size was beyond the usual bulk of these animals, and compensated the almost only fault of that most symmetrical breed of British cattle. Such a depth of carcase is seldom seen, and over the whole body the covering of the flesh was uniform and level. The hind-quarters fail in width when compared with the short-horns, and the buttocks are projecting rather than upright. In the large development of the hind-quarters the short-horns have no equals. This Devon animal was rather low in the back, and hung downwards in the belly, wide between the ribs and hook-bones, and deep in the chine. The animal showed a specimen of Devons such as is seldom seen, and may not soon occur.—The second prize was a Hereford ox of much merit. The length of the body exceeded the proportion of girth, and the shoulder was not well covered. The fore-ribs were uncommonly fleshy, and the thighs deep. The back and the set of the tail formed a continuous level, and the whole animal was one of the best that were shown. It showed the value of the stock of the Rev. Henry Berry.—The third prize went to the Duke of Richmond for a Hereford ox, of small size, but much merit. The body was more evenly fleshy than the higher prizes, the back more level, and the shoulders better covered. General opinion reckoned him one of the best beasts in the show.

The second prize in Class II., below Lord Hardwicke, was gained by a Durham ox of the middling quality. No single point showed any noticeable superiority, yet the carcase was very useful. The head and its provisions were coarse.—The third prize went

to a Durham ox of much weight, but not remarkable in any point.

The second prize in Class III., next the Gold Medal, went to a short-horned ox, of very superior merit. The size was small, but the quality of all points was much above mediocrity. Our own opinion reckons it the best short-horn that was exhibited.—The third prize also went to a short-horned ox, more bulky than the last animal, but much coarser in every point.

In Class IV., the first prize went to his Royal Highness Prince Albert, for a Hereford ox. The animal formed a choice specimen on every point, but lost much width in the hind quarters, a not uncommon case in the Hereford cattle. It was a most choice little beast.—The second prize was gained by a short-horned ox of great merit. No animal in the exhibition showed a more level back, better covered ribs, deeper thighs, or a wider twist. The head was coarse and heavy, and the colour unfashionable; but no more useful carcase was shown.

The first prize in Class V. went to the Earl of Aylesford, for a Devon ox. The fore parts were very good, as is usual with the Devon cattle, but the posteriors fall off very much in a lean flank, thin hind-quarters, a narrow rump, and widened short rib. This beast struck us as being very inferior in the due comparison.—The second prize went to a small Devon ox, of a quality superior to the last in every point of excellence.

In Class VI., the prize went to a Scotch polled ox of the Galloway breed, a beast of no common merit. The carcase of that breed is cylindrical beyond all others, and the flesh is deep and early in maturity; but the twist is narrow, and the neck shaggy and coarse. The head is large and elephant-like, and forms a great deformity to an otherwise well constructed animal frame. The present specimen was one of the first of the kind.

In Class VII., the prize cow was a short-horn of no common excellence. The back and hind quarters were unexceptionable, but the shoulder was bare, and the fore quarters generally coarse, a property very adherent to the short-horns. The general form of the body showed a very superior symmetry; back straight, loins wide, and chest very capacious.—The second prize went to a short-horned cow, more protuberantly fleshy than the former animal, but inferior in the general symmetry and level points. The two prizes contained a very large excellence.—The third prize went to a short-horned cow, belonging to His Royal Higness Prince Albert; a very fine animal, of fashionable colour, an evenly fleshy carcase, and very good general symmetry. General opinion allowed much merit to this animal.

In Class VIII., the prize Silver and Gold Medal for cows, went to a short-horned animal, which eclipses, in our opinion, every beast of the kind in the show, and of any other show in our recollection. The colour was, of all others, the most fashionable in a strawberry roan; the head, eyes, ears, and horns, faultless beyond comparison, and the whole carcase level, compact, and cylindrical, without any approach to equality in any animal of the exhibition. No specimen of a cow ever struck us so forcibly as a prominent type of the necessary character. The touch was soft but not silky, and fleshy without being placed in lumps. Our pleasure is truly sincere in giving this opinion of the animal.—The second prize went to a short-horned cow, of very good points, but completely shaded by the fore-mentioned animal.

In Class IX., the prize and Silver Medal went to a Durham cow of very good qualities. The general properties did not attract much notice.—The second prize went to a short-horned cow, of properties very like to the last mentioned.

Our examination of the cattle department of the show of this year, comes to the conclusion that the Gold Medals were never more meritoriously disposed—the Hereford ox of Mr. Heath, and the Durham cow of Mr. Gooch, being, in our opinion, the most proper specimens that may ever have been shown of the two kinds of animals; at least our recollection does not furnish the memory with any image of similar productions, and we believe this judgment is supported by the most valuable general opinion. We think that the short-horns decline, and the Herefords are confessedly improving; and are glad to see, in the prize Devon ox of Class I., our only fault to that breed being begun to be removed—in the size being too small—the ox of this year being very much beyond the usual dimensions of Devon cattle. In all other points they form the most symmetrical breed of cattle in Britain.

The general character of the cattle exhibited was very superior. The extra stock showed some large carcases, but nothing deserving particular notice except a cross animal between an Indian bull and Scotch kyloe, belonging to the Duke of Wellington, and only remarkable for an inveterate hostility to any approach.

In the Sheep department the long-woolled division gave the first prize, Silver and Gold Medals, to a well known breeder, Mr. Foljambe, in Nottinghamshire. This award, we think, is as well adjudged as the Gold Medals for cattle, the animals being, in universal opinion, of the very highest class of excellence. The wool is fine, open, and abundant, and the body deep, fleshy, and very symmetrical. The prominence and tightness of the fore flank, and the lightness of the posterior offal, were very remarkable. The Leicester breed of sheep have shown no superiors, if any equals. The second prize went to the Marquis of Exeter, who showed an excellent specimen of his lordship's well known breed of long-woolled animals. Many opinions, and those of some weight, would prefer them to Mr. Foljambe's sheep, in being shorter in the body, more compact, better clad with wool, and showing a general hardier constitution. For general use, this opinion would prevail. The third prize was given to Mr. Cranfield, of Bedfordshire, for three animals of much merit. From among the three lots, much difficulty would arise in settling points of preference.

The Leicester sheep were never better exhibited.—In Class XI., the prize and Silver Medal went to Lord Exeter, and we think most justly, for the long-woolled breed. The thick coat of wool evinces the proper hardihood, and the compact fleshy body promises the necessary furniture both in the outer and inner provisions.—The second prize went to Mr. Twitchell, of Bedfordshire, who is well known as a breeder. The three prizes formed a merit seldom equalled in the special section of sheep. We still give our opinion in favour of Lord Exeter's.—The third prize also went to Bedfordshire, and formed a good companion to the two first prizes, and in some respects would be reckoned superior, especially in the wool.

In Class XII., the prize and Silver Medal went to Mr. Beman, for his Cotswold sheep. They were heavy animals, and reckoned excellent of the kind.

In Class XIII., the first prize was for Leicester cross sheep with the Southdown. The animals showed well-formed carcases, much weight of body, and a large coat of wool. This cross is a most excellent animal for the butcher, but it is not beneficially prosecuted any further. The second prize was for a similar cross of very useful animals.

In Class XIV., the prize went to sheep of the Down and Leicester cross. The animals showed a most useful appearance, and were much noticed.

In Class XV., being the Southdown sheep, the prize and Gold Medal were gained by a new competitor, in Mr. William Buckland, Farringdon, Berks; at least we do not remember his name in former shows as a winner. If it be the first start, he has done the thing most thoroughly. We have not seen any animals of that breed any way like them in every general property, without exception. The Duke of Richmond's sheep and Mr. Rigden's stood contiguous, but were completely shaded, and not in our own single idea, but in the universal opinion which looked at the animals. The Duke of Richmond got the second prize for sheep of the well-known quality of the Goodwood stock.

In Class XVI., the prize and Silver Medal went to the Duke of Richmond, for sheep of 21 months old. No very remarkable quality was to be observed in this lot.

In Class XVII., the first prize was for aged sheep of 32 months, which formed one of the best specimens of the show; and the adjoining pen of the Duke of Richmond's, which got the second prize. Both pens very fully supported the character of the Southdown sheep.

In Class XVIII., no prize was given. The extra stock of sheep showed some good specimens of single animals; but nothing of very transcendent merit. Our examination of sheep concludes that they were never better shown by Messrs. Foljambe, Twitchell, and Lord Exeter, and that the winner of the Southdown medal has fairly eclipsed all precedence. The general show of Downs was well sustained. In every award of cattle and sheep, our own opinion fully coincided with the judges.

In Class XIX., being pigs, the prize was given to improved Essex pigs of Mr. Fisher Hobbs. No finer specimens could be seen of fresh pork and small bacon. The second prize was given to the Middlesex breed of Mr. Barber. The size is larger than the last, and more generally useful.

In Class XX., the prize, Silver and Gold Medals, was given to the Dorset breed of pigs, in three black animals. The useful form was unquestionable, and judgment of the prize undeniable.—The second prize was given to Prince Albert, for pigs of the York breed, possessing much merit. The last pen, and the present, might give much room for discussion, and the result might be very doubtful. Both are equally useful in yielding fresh pork in the small size, and hams and bacon in the older age. The judges must have seen superior excellence, but it must be small. The coat of hair on the Prince's pigs showed a vigour that is very necessary to all animal life.

In Class XXI., the prize was given to Lord Radnor, for pigs of the large breed. The animals were white, large, and handsome, and known as the Coleshill breed, and have no equals of the kind. The coat of hair on these pigs is very suitable. Several excellent pens were shown of large pigs, black and white, which exceeded the quality of some former years.

The extra stock showed many valuable animals, both large and small, but chiefly the former. Among them we noticed particularly an improved Middlesex pig, belonging to Mr. Barber, which deservedly attracted much notice. It gained a prize at Exeter show, and will gain more, if used for that purpose. Mr. Barber's pigs possess very much merit.

Our inquiry among the pigs observes that these animals never were better exhibited—more especially in the larger sort. The specimens were not so very heavy as in former years, and we think are improved thereby—as the pig, being naturally stupid and drowsy, requires some vivacity and length of leg to take exercise, to promote the animal functions. The animals of the present year suited this idea.

The implements were deficient in the number of former years, but the practical utility may not be much diminished on that account. The drill machines were exhibited by the well-known names of Smyth, Hornsby, Garrett, and Howard, and were of the commonly known kinds, with little or no addition. Mrs. Wedlake's business supports the well-established fame, especially in chaff-cutters, which implements were well exhibited in the show of this year. Draining-tile making machines were not so numerous as formerly, and draining tools were less abundant. Weighing machines were numerous, and seemed to work well. Grinders and crushers were plentiful, and gave satisfaction. The improved harness for horses by Deane deserves much notice, being neat and strong, and moderate in price.

Travelling machines for threshing grain were of the usual kind, and the steam engines accompanying. Winnowing machines were not very numerous—the best by Smith, of Kettering, to which the Yorkshire Society gave a prize; it revolves with much care. Dr. Newington's dibble gets into estimation. The ploughs and harrows of iron showed nothing new. Mr. Edgington's stack-cloths and M'Neill's asphalted felt con-tinue advancing in use; also the milk dishes of glass. Tiles of glass may soon cover all our farmeries. Mr. Crosskill's improved prize cart is much admired. Messrs. Cogan, 48, Leicester-square, show the dairy utensils of glass, tiles, and writing pens of glass. A cylindrical glass churn is very commodious in showing the condition of the contents at any time. The milk is removed from the glass dishes and the cream left in the bottom by the common syphon, through which a leather bucket is drawn by a wire to produce a vacuum, after which the milk runs till exhausted. This forms a simple skimming process. Messrs. Phillips also showed glass dishes and tiles of the same kind and use.

The roots were exhibited in the usual kinds by Messrs. Gibbs of London, and Skirving of Liverpool. The Turnips, Beet, Cabbages, and Potatoes, were very fine, but nothing beyond common years, and not so numerous. We particularly noticed the Stubble Swede Turnips of Mr. Rivers, of Sawbridgeworth, being a hybrid of Early Stone variety, and the Green-topped Swede. It promises to be a valuable substitute for the White Stone, as it grows as rapidly, and better withstands severity of weather.

The general remarks on this show must convey an unqualified approval of every department of the business. The gold medals never have been more justly awarded in every case, and never have the prizes given more general satisfaction in public opinion. The general notice fixes upon the very unusually large size of the Devon ox, which got the first prize in Class I., even at the age of 4 years and 3 months. It is the beginning to raise that handsome breed to an equality with others, in the only point in which they do not excel every breed of cattle in Britain. The number of cattle much exceeded former years, and certainly did not fail in quality. The notion gains ground to produce evenly-covered fleshy carcases of prime meat, and not as formerly, accumulations of fat and oily secretions. The practice has a most universal approbation.

MIDLAND COUNTIES CATTLE SHOW AT BIRMINGHAM.

The exhibition, a great improvement in every respect upon last year's, except perhaps in the pigs, and that could not easily be surpassed, was held in the New Bingley Exhibition Hall, which is admirably adapted for the purpose. The cattle, though not equal to the Smithfield exhibition either as to quality or number, were a very excellent show, far exceeding that of last year, being altogether superior both in the character of individual specimens and in the evenness of the show generally. The sheep were not a very striking feature of the exhibition, though here, too, there were pens of excellent quality to be seen. The pigs were equal to last year, both in number and quality, and that is speaking high in their praise. But the poultry department of the exhibition was decidedly the finest and most attractive of the whole. A finer collection of specimens never before were seen; but we must delay for a week our report on that part of the show. The following is the prize list of cattle, sheep, and pigs:

FAT CATTLE.

Herefords: Oxen or Steers.

1st prize, 10*l*. Exhibitor, Mr. Richard Allin, Long Itchington, Warwickshire. Breeder unknown.—2d, 5*l*. Exhibitor, Prince Albert. Breeder, Mr. Thomas Sheriff, Buckton, near Ludlow.

Highly commended.—Exhibitor and breeder, Sir Francis Lawley, Bart., of Middleton-hall.

Highly commended.—Exhibitor and breeder, Lord Hatherton, Teddesley-park.

Prize of 5*l*., and the Gold Medal, for the best ox or steer of any breed. Exhibitor and breeder, Lord Hatherton, Teddesley-park.

Herefords: Cows.

1st prize, 10*l*., and Silver Medal, as breeder. Exhibitor and breeder, Mr. James Williams, Culmington, near Ludlow, Salop.—2d, 5*l*. Exhibitor, Mr. John Thomas, Cholstrey, near Leominster. Breeder, Mr John Muscott, Westonbury, Herefordshire.

Highly commended.—Exhibitor, Mr. Matthew Ingle, Wigginton, Tamworth, Staffordshire. Breeder, Mr. W. Phillips, Ledbury, near Bishop's Castle, Salop.

Commended.—Exhibitor, Mr. Charles Wilson, the Hill Farm, Claines, Worcestershire. Breeder, Mr. Richard Mason, Prior's-court, Ledbury, Herefordshire.

Herefords: Heifers.

1st prize, 10*l*. Exhibitor, the Earl of Warwick, Warwick. Breeder, Mr. John Stephens, Sheephouse, near Hay, Breconshire.—2d, 5*l*. Exhibitor, Mr. Joseph Moore, Noverton, Stanford, Worcestershire. Breeder, Mr. John Perry, Much Cowan.

Short-Horns: Oxen or Steers.

1st prize, 10*l*. Exhibitor, Prince Albert. Breeder, Mr. John Henry Lees, Bacon's End, Coleshill, Warwickshire.—2d, 5*l*. Exhibitor and breeder, Mr. Isaac Pearson Evans, Griff, near Coventry.

Prize of 5*l*. Exhibitor and breeder, Mr. John Henry Lees, Bacon's End, Coleshill.

Highly commended. — Exhibitor and breeder, Mr. John Henry Lees, Bacon's End, Coleshill.

SHORT-HORNS: COWS.

1st prize, 10*l*. Exhibitor, Thomas Dilke, Esq., R.N., Maxstoke Castle. Breeder, Sir Charles Knightley, Bart., Fawsley-park.—2d, 5*l*. Exhibitor, Mr. Edward Bird Guest, Broadwas, Worcestershire. Breeder, the late Sir Anthony Lechmere, Bart, The Rhydd, near Worcester.

Highly commended.—Exhibitor, Mr. Joseph L. Hassall, Packington, near Ashby-de-la-Zouch. Breeder, Mr. John C. Hancock, Mattersey, near Blythe.

SHORT-HORNS: HEIFERS.

1st prize, 10*l*., and the Gold Medal, for the best cow or heifer of any breed; also the Silver Medal, as breeder. Exhibitor and breeder, Mr. Henry Roberts, Paxford.—2d, 5*l*. Exhibitor and breeder, Mr. Henry Roberts, Paxford.

Highly commended. — Exhibitors, Messrs. William and Richard Timms, Grandborough, near Southam. Breeder, Mr. William Goode, Grandborough.

DEVONS: OXEN OR STEERS.

1st prize, 10*l*., and the Silver Medal, as breeder. Exhibitor and breeder, the Earl of Leicester, Holkham-hall, Norfolk.—2d, 5*l*. Exhibitor and breeder, the Earl of Aylesford, Packington, Warwickshire.

Commended.—Exhibitor, Lord Hatherton, Teddesley-park.

DEVONS: COWS.

1st prize, 10*l*., and the Silver Medal as breeder. Exhibitor and breeder, the Earl of Aylesford, Packington, Warwickshire.

DEVONS: HEIFERS.

1st prize, 10*l*. Exhibitor, Mr. George Worth, Newnham, Warwickshire. Breeder, the late Mr. Thomas Umbers, Wappenbury.—2d, 5*l*. Exhibitor and breeder, the Earl of Aylesford, Packington, Warwickshire.

EXTRA: OXEN OR STEERS.

1st prize, 10*l*. Exhibitor, Mr. Joseph D. Rob, Catton, near Thirsk, Yorkshire. Breeder unknown.—2d, 5*l*. Exhibitor, Mr. John Thomas Robinson, Leckby-palace, Topcliffe, Thirsk, Yorkshire. Breeder, Mr. Beavly, Norton, near Stockton.

Commended. — Exhibitor, Mr. William Rogers, Martley-court, Worcestershire. Breeder, Mr. John Hill, Worcester.

EXTRA CLASS: COWS.

1st prize, 10*l*. Exhibitor and breeder, Lord Bagot, Blithfield, Staffordshire. Age, about six years.—2d, 5*l*. Exhibitor and breeder, Mr. H. Chamberlain, Desford, Leicestershire.

Commended.—Exhibitors and breeders, Messrs. William and Richard Timms, Grandborough, near Southam.

EXTRA CLASS: HEIFERS.

1st prize, 10*l*. Exhibitor, Mr. John Carwardine, The Weignalls, near Leominster. Breeder, Mr. John Addis Hill, Weston-under-Pedyard. — 2d, 5*l*. Exhibitor nnd breeder, Mr. Henry Roberts, Paxford.

Highly commended. — Exhibitor, Mr. Joseph L. Hassall, Packington, near Ashby-de-la-Zouch. Breeder, Mr. Carter, Stivichall, near Coventry. The whole of this class commended.

SCOTCH OR WELSH: OXEN OR STEERS.

1st prize, 10*l*. Mr. Joseph D Rob, Catton, near Thirsk, Yorkshire. Breeder unknown.—2d, 5*l*. Exhibitor, Mr. Joseph D. Rob, Catton, near Thirsk, Yorkshire. Breeder unknown.

Highly commended.—Exhibitor, the Right Hon. the Earl of Dartmouth, Sandwell; exhibitor Prince Albert (breeder and age unknown); exhibitor, Lord Leigh, Stoneleigh Abbey.

SCOTCH OR WELSH: HEIFERS.

Prize of 5*l*. Exhibitor, John Pickthall, Esq., Mint-house, near Kendall, Westmoreland.

The judges also awarded a Silver Medal to 10 steers exhibited in the yard as extra stock, by Sir Francis Lawley, Bart.

SHEEP.

For the best three wethers under 22 months' old.

LEICESTERS.

5*l*. to Mr. John Henry Lees, Bacon's End, Coleshill.

3*l*. to the same.

LONG-WOOLLED SHEEP, NOT LEICESTER.—5*l*. to Mr. Robert Beman, Moreton-in-the-Marsh.

SOUTHDOWNS.

5*l*. to the Right Honourable the Earl of Leicester, Holkham Hall, Norfolk.

3*l*. to Darwin Galton, Esq., Edstone, near Stratford-upon-Avon.

SHORT-WOOLLED SHEEP, NOT SOUTHDOWNS.—5*l*. to the Right Honourable Earl Howe, Gopsall Farm.

3*l*. to the Right Honourable the Earl of Aylesford, Packington, Warwickshire.

CROSS-BRED SHEEP.

5*l*. to Mr. John Benjamin Twitchell, Wilby, Northamptonshire.

3*l*. to Mr. A. Nurse, Ashby Parva, for the best 3 wethers under 34 months.

LONG-WOOLLED SHEEP.

3*l*. to Mr. John Henry Lees, Bacon's End, Coleshill.

2*l*. to the same.

SHORT-WOOLLED SHEEP.

5*l*. to the Right Hon. the Earl of Aylesford, Packington, Warwickshire.

3*l*. to the Right Hon. the Earl Howe, Gopsall Farm.

PIGS.

FAT PIGS, NOT EXCEEDING 9 MONTHS OLD.

5*l*. to Mr. Thomas Padmore, Persham-street, Birmingham. Breeder, Mr. Gordon, Swan Inn, West Bromwich.

3*l*. to Mr. W. Adams, Leighton Cottage, Spring-street West, Edgbaston, near Birmingham. Breeder, Mr. Bates, Digbetts, Birmingham.

2*l*. to Mr. John Mist, Great Barr, Staffordshire.

FAT PIGS, BETWEEN 9 AND 14 MONTHS OLD.

5*l*. to Mr. A. Nurse, Ashby Parva, Lutterworth. Breeder, Mr. B. Burrows, High Cross.

3*l*. to Mr. S. Wilkins, Peddemore Hall, Sutton Coldfield.

2*l*. to Mr. H. Hewitt, Clifton Mill, Warwickshire.

FAT PIGS, BETWEEN 14 AND 20 MONTHS OLD.

5*l*. to Mr. Arthur Perks, Kingsbury House, Kingsbury.

3*l*. to Mr. Thomas Studholme Wilkins, Peddemore Hall, Sutton Coldfield.

2*l*. to Mr. John Henry Lees, Bacon's End, Coleshill.

FAT PIGS, EXCEEDING 20 MONTHS OLD.

5*l*. to Mr. James Baldwin, King's Norton. Breeder, Mr. Docker.

3*l*. to Mr. Thomas Padmore, Pershore-street, Birmingham. Breeder, Mr. Charles Thorneley, Marston Hall.

2*l*. to Mr. David Mace, Chatteris, Isle of Ely.

SOWS OF A LARGE BREED.

5*l*. to Mr. M. Cartwright, Stanton (Tamworth Breed).

3*l*. to Mr. Simon Lucas, Bottley Mill, Warwickshire.

2*l*. to Mr. Moses Cartwright, Stanton (Cumberland).

SOWS OF A SMALL BREED.

5*l*. to Mr. Jonathan Brown, the Height, near Wigton, Cumberland.

3*l*. to Mr. Wright, 60, Bromsgrove-street, Birmingham. Breeder: Mr. Nathaniel Stilgoe, Chapel Ascott, Warwickshire.

2*l*. to Mr. George Vincent, Sherlock-street, Birmingham.

PENS OF FIVE PIGS OF ONE LITTER UNDER 6 MONTHS.

5*l*. to Mr. Jonathan Brown, the Height, near Wigton, Cumberland.

3*l*. to Mr. Matthew Pemberton, Gibraltar Works, Leeds.

2*l*. to Mr. M. Cartwright, Stanton.

PEN OF FIVE PIGS UNDER 3 MONTHS.

3*l*. to Mr. A. Perks, Kingsbury.

BRAWN OF LARGE BREED UNDER 12 MONTHS.

3*l*. to Mr. Moses Cartwright, Stanton, Cumberland.

2*l*. to Mr. Joseph Tuley, Keighley. Breeder, Mr. John Rhodes, Hainworth, Keighley.

5*l*. to Mr. Jonathan Brown, The Height, near Wigton, Cumberland. Breeder, Mr. Joseph Bell, Scale-hill, Lazonby, Penrith.

BRAWN OF SMALL BREED UNDER 12 MONTHS.

5*l*. to Mr. Matthew Pemberton, Gibraltar Works, Leeds.

3*l*. to Mr. R. Ashiom, Aldington, Worcestershire. Breeder, Mr. C. Marshall, Snow-hill, Gloucestershire.

2*l*. to Mr. J. B. Twitchell, Wilby, Northamptonshire.

Farmers' Clubs.

OXFORD: *The Blight of Wheat.*—Mr. Thompson, of Culham, said, speaking from his own experience, the black blight [mildew?] developed itself soonest, and in the most virulent form, on the finest land and on that which was in the highest state of cultivation. Wherever the haulm or straw was rankly luxuriant, there did the blight most certainly appear; rankness of vegetation, then, it would seem, was one cause of this disease, and this, favoured by a moist season, or by a low and dull exposure, was generally recognised as all that was necessary to produce the disease. It appeared to him, that this blight was a consequence of the deposition of the seed of a fungus, favoured by the state of the plant. They were all aware that the atmosphere held in suspension, at all times, myriads of the seeds of this class of plants; nothing indeed, of any kind, ever appeared to become fitted for their vegetation that was not instantly supplied with the seeds in quantity and variety almost beyond conception. As a general rule, all kinds of manure which excited a rapid and luxuriant growth, assisted by a moist warm atmosphere, when the plant was in a certain stage, favoured the attacks of blight.—Mr. John Harris, of Hinton, stated that he had found, from 30 years' experience, that the blight was most severe where there were Berberry bushes in the hedge-rows, and mentioned several instances in his own neighbourhood in support of that opinion. He also stated that he knew cases where the Berberry bushes had been grubbed where the blight prevailed, and that after that it had not developed itself, and he mentioned, as a further illustration, that his friend, Mr. Edmons, made a wager that he would cut a barberry bush, and place it among the Wheat, and that blight would follow, which was the case.—Mr. Joseph Gillett, of Haseley, was of opinion that there were many causes of blight, such as the cultivation of the land, want of solidity, and draining. There was no question that the cultivation of the land was an important feature in it, because if they made the land as rich as a dung mine, they would produce blight, and attract blight. In highly cultivated land, and where the Wheat was the most luxuriant, the blight was most likely to develope itself; and this was an answer to those theorists who preached high farming, for they who practised it found they obtained less produce. Where the land was the least cultivated, there they oftentimes found the kindest Wheat; and he had observed in the neighbourhood of Wycombe, where the land was in an inferior state of cultivation, they were free from blight. He believed, too, that porous land was more subject to the blight, because it produced the fungus, and was more susceptible of blight than land which was more solid. On a porous soil he had ploughed bean stubble with horses, and afterwards found the blight, and he fancied that a corrective, with a view to obtain solidity, would be by breast-ploughing; in consequence of that he had not since then put a horse-plough on bean stubble, but had used the breast-plough, which he found corrected the blight. If people would adopt the system of breast-ploughing, and good draining, he was satisfied in his own mind that they might obviate the blight in many seasons. It was true that blight might arise from atmospheric causes, but he was satisfied, from his own experience, that the solidity of the land had a great deal to do with it. He also attributed the blight to thin sowing, and to overgrown timber and hedge-rows, which should be done away with, for he knew the advantage of so doing, having about 480 acres, which were thrown open, and without a hedge-row or timber upon the whole. If they wished to cultivate land successfully, they should first ascertain what the land was capable of bearing, and be guided by their own judgment, and that of their neighbours, instead of listening to a parcel of theorists, who knew nothing of the locality, or the peculiarities of the soil. It was necessary, also, that the farmer should consider well what he was about, and not get his land into too high a state of cultivation, if he desired to obtain good crops. He gave the President great credit for bringing this subject before the club, but, at the same time, he thought they would do little good, even if they could correct the blight in Wheat, unless at the same time they could correct the blight in prices; and he thought that the subject to which they should all turn their attention was, how they could obtain a fair remunerating price for their produce. (Loud cheers.)—Mr. Watson, of Garsington, remarked that he knew nothing of the blight until it came into this neighbourhood. He had farmed in the counties of Nottingham and Leicester for 20 years, and during the whole of that time he never knew what blight was, but before he had been in this county two years he had not only found out what it was, but also felt the consequences of it. He thought that it originated from the mode of cultivating the land, and that there were other causes, such as atmospheric causes, over-cultivating, over-ploughing, and getting the land into too light a state. In other counties, where they did not pay so much attention to farming and feeding off sheep, they knew nothing of the blight, but here the best cultivated land was the most subject to it.—Mr. Long, of Farm Moor, observed that he had noticed a great deficiency in the yield of Wheat where there was no blight visible. He had one-third deficiency of yield, and attributed it to the high winds, and made the remark at the time that he feared it would be so. He had a piece of Wheat in which there had been the blight, and he attributed it to the Wheat not suiting the soil. There was a great difference in the soils, and some Wheats were more subject to blight than others, and therefore it was the duty of every one to select such Wheats as were not subject to it, and he did not hesitate to say that he had, from experience, found the Spalding Wheat freer from it than any other.—Mr. J. Orpwood, of Waterperry, said he had suffered both from blight and a deficiency of crop; but the Wheat which suffered from blight was sown the last, and he attributed it to its being late planted.—The President moved the following resolution, which embraced the views of those who had spoken on the question:—"That a proper cultivation of the land, and obtaining solidity, draining, sufficiency of seed, removal of the hedge-rows and hedge-row timber, thus admitting a free circulation of air, would contribute materially to prevent blight." The resolution was carried unanimously. *Abridged from the Oxford Journal.*

Calendar of Operations.

NOVEMBER.

CENTRAL YORKSHIRE, *Nov.* 30.—This month commenced with dry weather, but towards the middle the atmosphere thickened, and heavy rains, which were much needed, were the result, tending to replenish the ponds and springs, which were almost dry. During the fine weather, we availed ourselves of the opportunity of clearing and storing a good breadth of Swede Turnips for winter use, and of ploughing the stubbles for next year's green and root crops. These (with occasional days of threshing Barley) have been our principal operations. Our whole stock—farm horses, young horses, 36 stall-fed cattle, and 40 store cattle in the yards, pigs, &c., require a constant supply of straw. During three days of frost, we have carted 150 loads of earth upon fallow for admixture of soils. The young Wheats are looking most luxuriant, and apparently too thick in the plant, the seed having all vegetated—rare news for the thin seeders. Sheep upon cut Turnips are doing well. The prices in the meat markets have not made like progress; but we have been obliged to submit to them, in order to get rid of our latter Grass-fed beasts. The general remark has been, that autumn Grass this season has been anything but feeding; consequently, beasts have gone to market in second-rate condition—one cause of the flatness of the market. Some of our stall-fed cattle are ripe for Christmas. Our continual experience in the yield of grain, tends to confirm the shortness in the produce of our white crops generally. Our Barley, both in quantity and quality, is proving better than the Wheat, and we are making from 27*s*. to 30*s*. per qr. to the maltsters for it. The samples shown in the market generally are lean, and the lower qualities bad to sell. *J. S.—K. D.*

LAMMERMUIR SHEEP FARM, *Nov.* 30.—November is always a busy month on sheep farms, the shepherds, during the greater part of it, being closely occupied with the dirty but indispensable operations of bathing or smearing. In a late Number of the *Gazette* we gave the mixtures in common use here, so that it is unnecessary to repeat them now. We were fortunate in getting this business over before the recent heavy rains, which, in the case of recently bathed sheep, renders the work in a great measure useless, from washing off any mixture which is not of an oily nature; besides being injurious to the animals, from opening up the "sheds" in the fleece along which the liquid is poured, and which, in the case of close-woolled sheep especially, have not had sufficient time to reunite. The hoggs were all jacketed or "bratted," as it is provincially termed, about 10 days ago. From the experience we have had we are quite satisfied of the great benefit of such winter coverings to young sheep. We find, upon examining our mortality tables for the last 12 months, that out of 600 Cheviot and black-faced ewe hogs, the number of deaths has been but 16. Be it remembered also, that with the exception of about a score none of these ever tasted a Turnip, but fared with the ewes on the hill. Since we commenced the use of jackets, we have especially noticed an extraordinary diminution in the number of cases of "sturdy," or water in the head. Hydatids in the brain are generally understood to be induced by long continued heavy rains, cold winds, and general privation. Those who are acquainted with the Lammermuirs will readily admit that our flocks must have their full share of all these evils. Hence may arise the prevalence of this disease in the district; the actual loss from this alone amounting to at least one per cent., besides those which are cured by wiring. Our loss from sturdy during the past year is about one-eighth per cent. Any one conversant with sheep must have observed that during very wet weather the wool along the back parts in such a way as fully to expose the skin. The connection between the spine and the brain is obvious, and it cannot be wondered that hydatids should form in the brains of sheep which are much exposed to severe storms without due shelter. Hence the advantage of covering their backs with some material, which will protect them in a great measure from the chilling effects of wind and rain. The material in use is woollen, the size being 23 inches by 15. We lately purchased some coarse blankets, which made excellent covers, each jacket costing 4*d*. The rams were put to the ewes on the 22d. We allow about 45 ewes to each sheep. The young cattle are receiving a feed of Turnips morning and evening, with as much Oat-straw as they can eat. The cows are receiving straw at night, in addition to what they can pick up on the pastures during the day. In case of hard weather, they will be kept in the byres and yard, those which calve early getting a few Turnips. The ploughing of Oat stubble for Turnips is completed, except a few acres, which we intend manuring previously, which will be done whenever the ground is sufficiently dry or hard to prevent the carts doing any damage. We had begun to earth up the Turnips with the common plough, when a severe frost on the night of the 26th put a stop to all such operations. At present we are spreading a compost of lime and peat upon a piece of lea, to be ploughed up for Oats. During the continuance of frost, this, and carting out manure for Turnips, will constitute the work on the arable portion of the farm. During fresh weather ploughing and storing Turnips will occupy our attention. We have a considerable quantity of Green-topped Yellow stored. *A Lammermuir Farmer.*

Notices to Correspondents.

BOOKS: *A H F C.* We do not know any periodical that fully describes new implements, as an essential part of its plan. Blackie's Cyclopedia is pretty full upon it.—*W K W.* Strachan's Ready Reckoner.

CARROTS: *E D.* They are by no means a "faint" thing for a working horse. We give our horses ½ cwt. a day apiece or more, of clean roots uncut, placed in their manger at noon and night; they have, however, been long accustomed to them. They are a diuretic to unaccustomed cattle.

CATTLE FEEDING: *A Cattle Feeder.* The date of a *truth* does not at all affect its usefulness, and Mr. Brodie's (misprinted "Moore's") speech well deserved the same attention from

our readers as it actually received from his hearers; to many of both it was to a great extent repeated matter, but for neither is it useless occasionally to represent facts which have already been brought under their attention. These discussions before the Highland Society are the most useful things of the kind that have ever taken place, and it is a pity not to give them completely in readable type. It was not carelessness on our part that has occasioned your criticism; but a difference of judgment, which we still retain.

Cream. Add a dilute solution of chloride of lime to the milk. To every gallon of the latter a table-spoonful of the solution of half an ounce of the chloride in a gallon of water.

Drop Drills: *W B R.* There are many contrivances for converting drills into drop drills. Are you disposed to explain yours?

Farm Accounts: *E F., &c.* We are happy to say that "W. F.," of Gay Bowers, Essex, is to give us a series of papers on this subject in our next year's volume.

Flax: *Worth.* You had better manure the Barley stubble well now, and get it rotted in the soil and mixed with it before April. Flax will flourish better after Swedes fed on the land than after almost anything else, provided you can get a good tilth early enough. Mr. Dickson has written a work on Flax, and a still cheaper one is written by T. Keir Short.

Gorse: *M C S.* We must refer you to a forthcoming number of Blackie's "Cyclopedia of Agriculture," or to Mr. Firchild, of 21, Frederick-place, Hampstead-road.

Grass: *P S.* Try 1 cwt. of nitrate of soda and 2 cwt. of guano per acre, sown broadcast in February or March.

Hay Seeds: *T Clod.* You mistake. The "ignorance" chargeable on the question consists, not in not knowing the botanical names of hay seeds, but in supposing anyone knows them. They are a hodge-podge of all sorts. Tell us any particular plant by its common name, and if we know it by that name, we shall be happy to tell you any other name, scientific or otherwise, that it may happen to have.

Linseed: *A Sub.* We have applied for the experience of a cold water man. Our own plan is to boil, as heretofore; but they *say* that to soak the ground Linseed in cold water for 36 hours answers well.

Mr. Mechi's Lecture: *W G D.* Your critique, *or* an explanation of the mistake, shall appear directly.

Name and Address: Will "*E. X., Braintree,*" be kind enough to forward *his*.

Pigeons: *P T O.* See page 782, col. *b*.

Potatoes: *J T.* We do now know the "mealy" Potato. The "cup" is well known all over Ireland, from whence it is to be easily had.

Rabbits: *A Constant Reader* asks if any one has had experience of rabbits, kept for the sale of their produce, as a profitable speculation.

Rats: *B W.* Procure the pamphlet entitled "Rat! Rat!! Rat!!!"

Roe Deer: *A S.* Probably too good living and want of sufficient exercise might have been the cause of death, unless the food was different from what they had been accustomed to, or contained deleterious properties. We would recommend bruised Linseed to be given in a mash as a preventive; and, by way of medicine, protochloride of mercury, 5 grains; tartarised antimony, 5 drachms, to be given in the mash daily for several days. *W. C. S,*

Errata.—Mr. Honeyman's speech, referred to at page 777, will be published next week; it was accidentally omitted in our last number, and we have no room for it in this.—Mr. Wilkins wishes us to correct a mistake in one of his letters on thin seeding. He *has* put in 2 pecks of seed Wheat per acre, but has not exceeded 2 pecks. He has put in ½ a peck, and will back that against the 2 pecks, though it was put in on the 6th of this month. He himself considers 1 peck sufficient, and 2 pecks as a maximum.

Markets.

COVENT GARDEN, Dec. 14.

Hothouse Grapes and Pine-apples are quite equal to the demand. Oranges and Lemons are plentiful. Pears are still received from the Continent. Nuts have not altered since our last account. A few examples of forced English Strawberries have made their appearance, but they do not meet with a ready sale. Among Vegetables, there has been some excellent Seakale, and a little Rhubarb has been supplied. French Beans are more plentiful. Carrots and Turnips are good in quality, and so are Potatoes. The latter are getting dearer. Lettuces and other salading are sufficient for the demand. Mushrooms are cheaper. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Fuchsias, Mignonette, Tulips, Double Primroses, Gardenias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Pommegranates, each, 3d to 6d
Grapes, hothouse, p. lb., 4s to 6s	Almonds, per peck, 6s

COAL MARKET.—Friday, Dec. 13.

Hartley, 15s.; Eden Main, 15s. 9d.; Wallsend Hetton, 17s.; Wallsend Lambton, 16s. 6d.; Wallsend Stewarts, 17s.; Wallsend Tees, 17s.—Ships at market, 32.

POTATOES.—Southwark, Dec. 9.

The Committee report that owing to the continued S.E. wind, our market has been supplied principally during the last week by rail, which has been very considerable. The very few Yorks and Scotch that have arrived have realised our extreme quotations; those by rail being of such various qualities, we are obliged to give a large range of prices. There have been a few cargoes from France, which met a ready sale. The following are this day's quotations:—York Regents, per ton, 90s. to 100s.; Scotch do., 65s. to 80s.; Wisbeach do., 70s. to 90s.; French whites, 70s. to 80s.

SMITHFIELD, Monday, Dec. 9.

We have a large supply of Beasts, but not so many as were expected. Trade is nearly as good as of late for the best qualities, but several second-rate cannot be sold, although there is a disposition to take lower prices. There are a few more Sheep, and the demand is smaller, consequently trade is very heavy at less money. Trade is dull for Calves; inferior quality is sold very low. From Holland and Germany we have 957 Beasts, 2090 Sheep, and 136 Calves; from Scotland, 500 Beasts; and 3200 from the northern and midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	8	to 3	10
Best Short-horns	3	4	— 3	8
2d quality Beasts	2	4	— 3	0
Best Downs and Half-breds ...	3	8	— 4	0
Ditto Shorn	—		—	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools .	3	6	to 3	8
Ditto Shorn	—		—	
Ewes & 2d quality	2	10	— 3	2
Ditto Shorn	—		—	
Lambs	—		—	
Calves	2	4	— 3	8
Pigs	2	8	— 3	8

Beasts, 4867; Sheep and Lambs, 25,210; Calves, 178; Pigs, 329.

Friday, Dec. 13.

The supply of Beasts is very large, even taking into consideration that it is near Christmas; some of the best qualities find purchasers at about Monday's quotations, but there is scarcely any inquiry for inferior kinds; several remain unsold. The number of Sheep is also large and the demand small. Trade is exceedingly dull, at rather lower prices than on Monday. We have not got many good Calves on offer, consequently this description are sold readily; but trade is very dull for middling kinds. From Holland and Germany there are 402 Beasts, 3000 Sheep, and 148 Calves; from Scotland, 240 Beasts; from Sussex, 80; from Norfolk and Suffolk, 200; from West Country, 200; 1000 from the northern and midland, and 82 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3	8	to 3	10
Best Short-horns	3	4	— 3	8
2d quality Beasts	2	4	— 3	0
Best Downs and Half-breds ...	3	10	— 4	0
Ditto Shorn	—		—	

Best Long-wools .	3	4	to 3	6
Ditto Shorn	—		—	
Ewes & 2d quality	2	8	— 3	0
Ditto Shorn	—		—

Beasts, 2336; Sheep and Lambs, 6470; Calves, 239; Pigs, 385

MARK LANE.

Monday, Dec. 9.—There was a fair supply of English Wheat by land carriage samples to this morning's market, the bulk of which was disposed of on the terms of this day se'nnight, but a few of the finest samples remained unsold at the close. Foreign met a limited demand; on the sales effected late prices were barely supported.—Fine English and foreign Barley commands its previous value, secondary English is very unsaleable even at a decline of 1s. per qr.—The prices of Beans and Peas are unaltered.—Oats meet a good demand at an advance of 6d. per qr.—The Flour trade is heavy.

Friday, Dec. 13.—The arrivals of all grain since Monday have been small, and that day's prices may be considered nominally the same, transactions in Wheat, Beans, and Peas being quite in retail.—Fine English and Foreign Barley is held at our quotations: secondary sorts are unsaleable, although offered at a further reduction of 1s. per qr.—The Oat trade is firm, but the enhanced prices restrict business.—We observe no reduction in the price of Flour; trade is heavy.

Liverpool, Friday, Dec. 6.—The arrivals into this port of grain, Flour, and Oatmeal, coastwise and from Ireland, since Monday last, are unusually small; from the American States, however, we have a tolerable supply of Wheat and Flour, and from France a moderate quantity of Wheat, Barley, and Beans, with 10,451 sacks of Flour. At our corn exchange to-day we experienced a very dull and stupid market for all the leading articles of trade, even upon a retail scale; it was therefore difficult to effect the sale of any description of Wheat without submitting to such terms as holders refused to concede, and the trade closed at prices rather under those of Tuesday. Barley and Malt supported late rates. Beans and Peas in limited request, but not cheaper. Good Oats were quite as dear as on Tuesday.——Tuesday, Dec. 10.—At our market this morning a tolerable quantity of Wheat was disposed of for Irish account, but having no speculative demand, and millers continuing to act with the same caution as for some time past, the best qualities of Wheat receded 1d., and middle and inferior 2d. per 70 lbs. from the rates of this day se'nnight. Malting Barley remained stationary in value, and grinding samples were 1d. per bushel dearer. In Malt, Beans, and Peas no variation was apparent. Oats being extremely scarce, a small cargo of prime Irish mealers just arrived, realised 2s. 9d., being 1d. per 45 lbs. over the currency of last week; Oatmeal at the same time moving slowly at an abatement of 3d. per load.

HARTLEY'S PATENT ROUGH PLATE GLASS.

James Phillips and Co., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of Glass. Cut to order in panes of

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15s. each.

Large sizes, 16 oz., 2d. and 2½d. per foot.

Large sheets, in 200 and 300 feet cases, 2½d. to 2¾d. per foot.

16s. per box; or 2¾d. per foot if less than one box be taken:

11	inches by 8 inches	13 inches by 9 inches	
12	,, by 8 ,,	12 ,, by 10	,,
12	,, by 9 ,,	14 ,, by 10	,,

Boxes charged 1s. each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sash-doors, &c., post-free on application.

J. Lewis, Horticultural Works, Stamford-hill, Middlesex.

Just published, considerably enlarged, price 5s. 6d., the Third Edition of

RURAL CHEMISTRY:

AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honourable East India Company's Military Seminary at Addiscombe, &c., &c.

PREFACE TO THE THIRD EDITION.

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits, Baking, Cheese-making, Cookery, &c., have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."

Published by J. Matthews, at the Office of the *Gardeners' Chronicle*, 5, Upper Wellington-street, Strand, London; and may be had by order of any Bookseller.

J. E. DOWSON, 123, OXFORD-STREET

(FIVE DOORS WEST OF REGENT-CIRCUS),

Is the Sole Manufacturer of the

PRIZE STOVE OF 1850,

Now Exhibiting in the Model Room of

THE SOCIETY OF ARTS,

John-street, Adelphi, London;

AND IS UNQUESTIONABLY THE

CHEAPEST STOVE IN THE MARKET.

IT HAS ALREADY BEEN EXTENSIVELY ADOPTED, AND IS KNOWN AS

CUNDY'S PATENT IMPROVED OPEN FIRE-PLACE, WARM AIR, VENTILATING STOVE.

IT IS ADMIRABLY ADAPTED TO

WARM AND VENTILATE CHURCHES, CHAPELS, VESTRIES, SCHOOL-ROOMS,

AND OTHER PUBLIC PLACES, HALLS, DINING-ROOMS, LIBRARIES, CLUB-ROOMS, &c.

THE ADVANTAGES OF THIS STOVE ARE—

1. That it combines the CHEERFULNESS of an open fire with the comfort of a constant supply of Fresh Atmospheric Air of a genial temperature.

2. That it consumes the IMPURE air of a room and replaces it by the admission of PURE air from without.

3. That it preserves the BALANCE between the CONSUMPTION of the impure and the ADMISSION of pure air so accurately that it effectually prevents BLASTS of cold air through crevices in doors and windows.

4. That it never raises the temperature of the air, which is warmed by passing through the stove, so high as to burn it, or impart to it any UNPLEASANT SMELL OR INJURIOUS PROPERTIES.

5. That it imparts so large a proportion of its heat to the air in its passage into the room through it, that the SMOKE FLUE can never get so heated as to endanger the building, or to add to the risk in insuring.

6. That as nearly all the heat produced by the fire passes with the air into the room, and very little up the flue, it obviously economises the fuel.

The ADVANTAGES of CUNDY'S PATENT STOVES, therefore, are CHEERFULNESS and COMFORT, PURITY and WARMTH of the Air, the Absence of any Noxious Properties, FREEDOM from DANGER, and ECONOMY of FUEL.

Letter from the Rev. MATTHEW O'BRIEN (Professor of Natural Philosophy and Astronomy), M.A., F.R.S., &c., King's College.

I beg to certify that one of Mr. Cundy's Patent Stoves was put up in my Lecture Room, at King's College, last year, in place of a Common Stove (of Arnott's construction I believe). I have no hesitation in saying, from actual experience, that Mr. Cundy's Stove is far superior both in producing warmth over the whole room, and in promoting ventilation, without disagreeable currents of air, or close smell.

MATTHEW O'BRIEN.

From GEORGE HITCHCOCK and ROGERS, St. Paul's Churchyard.

St. Paul's Churchyard, March 7, 1850.

Dear Sir,—We have never had occasion to regret the substitution of your excellent Stoves for the hot-water apparatus with which our establishment was previously heated; all our customers seem delighted with the change.

The improved ventilation produced by them—the entire freedom from that smell of iron so common to most other stoves, and the agreeable sight of the fire—render them most desirable for such establishments as ours.

We are, dear Sir, yours truly,

GEORGE HITCHCOCK AND CO.

The STOVES may be obtained of the Sole Manufacturer, J. E. DOWSON, 123, Oxford-street (five doors west of Regent-circus), where a Stove is in constant operation. They may also be seen at Messrs. HITCHCOCK and ROGERS, St. Paul's Churchyard; and in the Model Room of the Society of Arts, Adelphi; from which Society Mr. CUNDY, on the 22d July, 1850, received their large SILVER MEDAL for the invention.

Now ready, price 1s., or post free 18 stamps.

GLENNY'S GARDEN ALMANAC AND FLORIST'S DIRECTORY for 1851, containing Directions for the management of an Amateur's Garden during the year. Lists of the best Show Flowers, Fruits, Plants, and Vegetables; valuable hints to Lady Gardeners, and other useful information.

London: C. Cox, 12, King William-street, Strand.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

Incorporated by Act of Parliament, 12 and 13 Vict. c. 91.

With limited Liability to Shareholders.

Capital—£100,000, in Shares of £20 each.

Directors.

HENRY KER SEYMER, Esq., M.P., Hanford, Dorset—Chairman.
JOHN VILLIERS SHELLEY, Esq., Maresfield Park, Sussex—Deputy-Chairman.

Samuel Morton Peto, Esq., M.P., Great George-street
Francis Pym, Esq., The Hassells, Biggleswade, Beds.
Colonel George Alexander Reid, M.P., Bulstrode Park, Bucks.
William Tite, Esq., F.R.S., Lowndes-square, London
William Wilshere, Esq., The Frythe, Welwyn, Herts

Bankers.

Messrs. Currie & Co., 29, Cornhill, London.

Solicitors.

Messrs. Bircham, Dalrymple, and Drake, Parliament-street.
Messrs. Hoddings, Townsend, and Lee, Salisbury.

Central Engineers and Surveyors.

Messrs. J. Bailey Denton and Henry Drake.
(Assisted by eminent Local Surveyors).

Secretary.

WILLIAM CLIFFORD, Esq.

Temporary Offices—No. 46, Parliament-street, Westminster.

The Powers of the Company enable the owner of a Limited Interest in Land, by a cheap and simple process, to carry out every kind of permanent Improvement thereon, either by the application of his own or the Company's funds, secured by a terminable yearly charge on the Inheritance; but the absolute owner of the freehold may enter into any agreement with the Company for the exercise of any of its powers, machinery, or resources.

The powers of the Company may be thus enumerated:—

1. To execute all works of Drainage (including Outfalls through adjoining Estates), Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

The terms on which the remaining Shares will be allotted are a deposit of 1*l.* per Share, with a liability to be called on for the remaining amount by Instalments not exceeding 2*l.* 10*s.* per share, at no closer intervals than 3 months. Not more than 1*l.* per Share is likely to be called for during the next two years. The liability of every Shareholder is clearly limited to the amount of his Subscription.

Application for further information, or for allotment of Shares, may be made to the Directors, Solicitors, or Secretary.

WILLIAM CLIFFORD, Secretary.

Second Edition, much enlarged. Woodcuts. 3*s.* 6*d.*,

London: WHITTAKER and Co., Ave Maria-lane.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The Council of the Royal Agricultural College, at Cirencester, propose, after the ensuing Christmas Vacation, to receive within the walls of the College Students who, at the date of their admission, do not exceed 16 years of age, though they will not necessarily be removed on reaching that age.

Students between the ages of 16 and 20 may be received in a commodious Boarding House, in Cirencester, under the superintendence of a resident Professor or Master. Out-Students above the age of 20 will be admitted on the same footing as heretofore.

TERMS, PER ANNUM,

TO BE PAID HALF-YEARLY, IN ADVANCE.

Pupils under fourteen years of age	45	Guineas.
Ditto above fourteen	55	,,
For a separate sleeping apartment, if it be required, an additional	10	,,
For a share in a private study, of which there are but a limited number	5	,,
Pupils in the Boarding House	80	,,
Out-Students	£40	

Excepting in the case of Out-Students, these terms will include everything but medical attendance, books, and writing materials.

The Religious instruction and moral discipline of the whole of the Students will be most carefully attended to, as the groundwork of all education.

The Lectures in Chemistry—the Veterinary Art—Geology—Botany and Zoology, hitherto so ably presided over and conducted, will be continued, for the especial benefit of the elder Students.

Instruction—by competent Masters—in Arithmetic, Algebra, Mathematics, and Natural Philosophy, Surveying and Mensuration, in History and Geography—will be offered to every Student; while those, whose Parents desire it, will be instructed in Modern Languages and Classics.

Agriculture will be taught on the Farm—where the Students will be led to compare what they have learnt in the Lecture Room with the practical system of cultivation which they will see carried out.

They will also have the opportunity of becoming thoroughly acquainted with the breeding, rearing, feeding, and general management of all kinds of Stock—with the preparation of Corn for the market—and with the application of Steam Machinery to Farming purposes—and also with the best system of Farm Accounts.

It will be seen from the above that the Royal Agricultural College offers decided advantages to those who wish to qualify their Sons, either for the pursuit of Agriculture as a profession, or for becoming Land Agents or Stewards; also to persons of any age, who, intending to emigrate, desire to obtain some knowledge of Agriculture before leaving England; moreover, no slight inducements are held out to all parents, who are desirous of procuring for their Sons such an Education as will qualify them for any calling or profession, at as moderate a cost as is compatible with the advantages offered, and with the liberal scale on which the comfort of Students will be attended to and promoted in every particular.

For further information, &c., application may be made to the Principal,

The Rev. JOHN SAYER HAYGARTH,
Rodmarton, Cirencester.

Dec. 14.

SOUTHAMPON.—EXTENSIVE SALE OF NURSERY STOCK AND SEEDS.

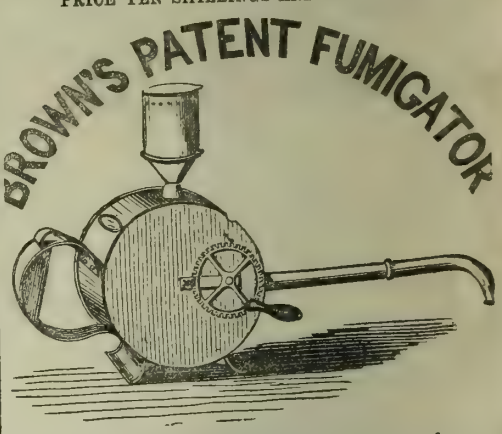
TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS have received instructions to submit for unreserved Sale by Auction, on the premises, at Hill and Sidford and Southampton Nurseries, on MONDAY, Dec. 16, 1850, and following days, at 11 o'clock, precisely, each day, in consequence of the number of lots, the very valuable and extensive Stock of Fruit and Forest Trees, Evergreens, Coniferæ, American Plants; Agricultural, Garden, and Flower Seeds; Bulbs, Roots, &c., and every other article in the Trade, for which "Page's Nurseries" have been so highly celebrated; also a four-wheeled Chaise, Carts and Horses, Utensils, and Implements of Trade. May be viewed, and Catalogues had prior to the Sale, 1*s.* each; returnable to purchasers; on the premises, 57, above Bar, Southampton; of the principal Seedsmen in London; at the Inns in the neighbourhood; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B.—The valuable Freehold Premises, comprising a capital Dwelling-house in the above Bar-street, Southampton, with an extensive range of Green-houses, Stores, Out-buildings, and Nursery-grounds, in the rear extending to Portland-terrace, are for Sale by private contract. Particulars may be had on application to Mr. William Brooks, Accountant and Estate Agent, 24, Portland-street, Southampton.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

PRICE TEN SHILLINGS AND UPWARDS.

BROWN'S PATENT FUMIGATOR

A PORTABLE INSTRUMENT for Fumigating Greenhouses Stoves, and Frames, or Shrubs and Flowers, in the open air without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

WHERE TO BUY A DRESSING-CASE.—In no article perhaps is caution more necessary than in the purchase of a Dressing-Case, for in none are the meretricious arts of the unprincipled manufacturer more frequently displayed. MECHI, 4, LEADENHALL-STREET, near Grace-church-street, has long enjoyed the reputation of producing a Dressing-Case in the most finished and faultless manner. Those who purchase one of him will be sure of having thoroughly-seasoned and well-prepared wood or leather, with the fittings of first-rate quality. The prices range from 1*l.* to 100*l.* Thus the man of fortune and he of moderate means may alike be suited, while the traveller will find the Mechian Dressing-Case especially adapted to his necessities.—4, LEADENHALL-STREET.

A CERTAIN CURE ARE HOLLOWAY'S PILLS for Headaches, Lowness of Spirits, and Pains in the Chest.—A Soldier, who had seen much service abroad, suffered for years from Headaches, Lowness of Spirits, and Pains in the right side, which had so debilitated him that it was found necessary to discharge him from the service. Every attention had been paid to his complaints both by the army surgeons and in the hospitals; at last it was decided that he was incurable, but since his discharge he commenced taking HOLLOWAY'S PILLS, which have been the means of restoring him to that buoyancy of spirits and excellent health that he had not enjoyed for years.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, DECEMBER 14.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododeudron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Dec. 21.

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

CUTHILL'S "BLACK SPINE" and SNOW'S PRIZE CUCUMBERS at 1*s.* each packet: also his early Scarlet-flesh Melon, 1*s.* Lisianthus Seed, 1*s.* per packet. CUTHILL'S Pamphlet of 56 pages, containing the Belgian Prize Essay on the best way of producing Potatoes; with 12 more articles on fruits and vegetables, among which are Asparagus, Rhubarb, and Seakale. The pamphlet has been very favourably reviewed by Dr. Lindley and others. Price 2*s.*, or by post, 2*s.* 4*d.* The trade supplied with the Cucumbers.—JAMES CUTHILL, Denmark-hill, Camberwell, London.

WINTER AND EARLY SPRING CUCUMBER.

J. WEEKS AND CO. are now sending out Seeds of their new free-bearing Cucumber "The Great Gun," in packets, 2s. 6d. each. For Winter and Early Spring use it is unequalled. Also, the *true* high-flavoured "Cassabar" Melon, in packets, 2*s.* 6*d.* each.

SUTTON'S PRICED CATALOGUE OF HOME-GROWN GARDEN SEEDS, containing the description and *price of every article* required for the Kitchen-Garden, Flower-Garden, and Farm, may be had on application, addressed JOHN SUTTON and SONS, Seed Growers, Reading, Berks, enclosing two postage stamps.

N.B.—Goods delivered Carriage Free.

THEODORE LOCKHART, FLORIST and SEEDSMAN, No. 84, Fleet-street (next door to the *Punch* Office), London, has opened the above premises in connection with the Nursery at Fulham. The greatest attention has been paid in selecting the Seeds, a List of which may be had gratis, on application.

	s.	d.

Rhubarb, Seakale, and Asparagus Roots; Fruit Trees, Pruning Knives, Mushroom Spawn, Mats.

TO MARKET GARDENERS, NURSERYMEN, & OTHERS.

TO BE DISPOSED OF, a LEASE of about Six Acres of MARKET GARDEN GROUND, with Growing Crops; a good, new, and substantial Brick House on the ground, at a very low rent, within eight miles of London, in consequence of a death in the family.—For particulars, inquire of T. BARNARD, 9, Great Russell-street, Covent-garden, London.

"CEDRUS DEODARA" AND "CUPRESSUS TORULOSA ELEGANTISSIMA."

WM. MAULE AND SONS are now prepared to offer, from their large supplies of CEDRUS DEODARA of various sizes, many thousands of fine specimen plants (grown from seed constantly in the open ground and in pots) measuring 3 feet and upwards, unusually fine and bushy, with good leaders, at 60*s.* per dozen; also many thousands of fine plants of CUPRESSUS TORULOSA; the hardy variety Elegantissima in pots, upwards of 2 and 3 feet, at 50*s.* and 75*s.* per hundred; they also abound with good supplies of the Himalaya Conifera generally, together with a large Stock of Scarlet Crimson Himalaya and other hardy Rhododendrons, prices for which will be forwarded on application.

N.B. W. M. and SONS' Lists of prices for Fruit, Forest, Evergreen, and other Trees and Shrubs required at the present planting season, are now ready for distribution, and will be forwarded on application.

References expected from unknown correspondents.

Stapleton-road Nurseries, Bristol.

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.

For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes, Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.

Exotic Nursery, King's-road, Chelsea, London.

FINE PURPLE TOP SWEDISH TURNIP SEEDS FOR SALE.—200 Bushels, pure, and of excellent Stock, raised by one of the first Agriculturists of Berwickshire, who has for many years paid great attention to the raising of Turnip Seeds.—Apply to W. KINGHORN, Dunse, N.B.

GRAVESEND.—50,000 TREES AND SHRUBS ON SALE.—Arbor-vitæ, Berberis aquifolium, Cytisus, Cypress, Holly, Jasminums, Lilacs, Laurels, China Roses, &c., 2 to 4 feet, from 15*s.* to 40*s.* per hundred. Standard Roses, 4*l.* to 5*l.*

Aucuba japonica, Arbutus, Cotoneaster, 2 to 3 ft., 12*s.* per dozen; Irish Yews, 3 to 4 feet, 25*s.*; Standard Roses, in sorts, 18*s.* to 30*s.*

Large ornamental Trees, for immediate effect, Greenhouse and Herbaceous Plants, in great variety, at low prices.

Apply at the Cemetery, Gravesend, Kent.

NEW EARLY PEAS, &c.

BASS AND BROWN have a very fine Stock of the undermentioned early Seeds, which they are enabled to offer at the following low prices:—

	Per quart.—*s.*	*d.*
PEAS, Taylor's new Prolific, very early, hardy, and productive, sent out by Barnes	1	6
Essex Champion, hardy and very productive	0	8
Danecroft Rival, very early	1	3
Bishop's new Long-pod, great bearer	1	0
Early Warwick, Early Frame	0	6
Early Emperor, very early and hardy	0	10
Fairbeard's Champion of England	1	0
BEANS, Long-pod and Windsor	0	6
RADISH, early Short top Salmon	1	6
Wood's new early Scarlet	2	0

Their Wholesale List of Prices of the above and all other description of Seeds will be forwarded on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

COCHIN CHINA FOWLS.

A FEW THOROUGH-BRED COCKS FOR SALE. Apply to "W. O." at Mr. MacLachlan's, 6, Birchin-lane, Lombard-street, London.

CARTER'S CATALOGUE OF SEEDS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, announces the speedy appearance of his new CATALOGUE FOR 1851, which will be forwarded, gratis and prepaid, on application by post or otherwise. He begs leave to state that the Floricultural section comprises, as usual, the Scientific and English Name of each plant, the Linnean Class and Order, and Natural Order to which it belongs; its hardiness, duration, time of flowering, and colour of the flowers, and other necessary information. The collection of Flower Seeds will comprise several splendid novelties.

THE BEST AND MOST PROLIFIC EARLY KIDNEY POTATO GROWN.

"Eglinton Castle Gardens, Ayrshire, Oct. 23, 1850.

"DEAR SIRS,—Having grown a quantity of your improved Kidney Potato here, and at Pitfour Castle, Perthshire, I have in both cases found it to be earlier and a superior flavoured Potato to any other I know. Its dwarf habit makes it a most excellent variety for Frame Forcing, which I proved here last spring.—I am, dear Sir, yours truly, WILLIAM SHARPE."

"To Messrs. Jackson and Son,

"The Nurseries, Kingston, Surrey."

THOMAS JACKSON and SON have much pleasure in quoting the above testimonial, from a well-known authority, of the merits of their Improved Kidney Potato, and they are happy to say they have now to offer fine healthy sets at 7*s.* 6*d.* per bushel. T. J. and Son have also to offer, at 5*s.* 6*d.* per bushel, good healthy sets of the Early Prolific round Potato Golden Dwarf. To be obtained of T. J. and Son, and from most of the Wholesale Seed Firms in London.

T. J. and SON have a large Stock of Fruiting and Succession Providence, Queen, and other Pine Plants, strong, healthy, and warranted clean. Price, according to quantity required, may be obtained upon application.

Nursery, Kingston, Surrey, and Royal Gardens, Hampton-court.

TO NURSERYMEN, FLORISTS, & MARKET GARDENERS.

TO BE LET, AT NORTH-END, FULHAM, Five Acres of Walled Garden, with immediate possession. Ground well Stocked with Fruit Trees and Bushes, and Moss and China Roses. The Land in excellent condition, and has thereon a good Forcing House, between 68 and 70 feet long.

For particulars, apply to Mr. ATWOOD, Auctioneer and Land Agent, Mortlake, Surrey; or at the "Rainbow," King-street, Covent-garden.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

December 21.

RHODODENDRONS AND AMERICAN PLANTS.—An unlimited supply always on sale, at the low scale of prices quoted, delivered in London, if ordered in quantity, free of carriage.

RHODODENDRON PONTICUM, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, very fine, fit for planting out for cover, 20*s.* to 40*s.* per 100; 4 to 6 feet, single stems, adapted for working the beautiful new scarlet and other rare species, 50*s.* per 100.

SCARLET RHODODENDRONS, of the finest varieties, 18*s.* to 30*s.* per doz., on their own roots.

WHITE RHODODENDRONS, 18*s.* per doz.

KALMIA LATIFOLIA, 6 to 9 inches, 25*s.* per 100; 1½ to 2 feet, blooming, 12*s.* per doz.

Dwarf ROSE Stocks, fit for working, 8*s.* per 100.

Single CAMELLIA Stocks, fit for working, 42*s.* to 50*s.* p. 100.

ABIES (Pinus) Douglasii (from seed), 1½ to 2 feet, fine plants, 60*s.* per doz., 7*s.* 6*d.* to 42*s.* each; 1½ foot Scotch Fir, 2 years seedling (very fine), 2*s.* per 1000.

SCOTCH LARCH and PINEASTER FIR (very stout), 10*s.*, 15*s.*, 25*s.* per 1000, 1 to 3 feet.

ARBUTUS, 12 to 15 inches, fine, 25*s.* per 100; 6 inches, 8*s.* per 100.

LAURESTINE, two sorts, 8*s.* per 100, bedded, 1 foot.

TREE ROSES of the most esteemed kinds, 12*s.* to 18*s.* p. doz.

A large and fine Stock of the true "Durmast" English OAK, transplanted, 3 to 5 feet, 40*s.* to 60*s.* per 1000. With every description of Fruit and Ornamental Trees.—For Catalogues and prices apply to W. ROGERS, Nurseryman and Contracting Planter, Red Lodge, near Southampton.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. COGAN and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN, LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10*s.* 6*d.* per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalized, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

Just published, considerably enlarged, price 5s. 6d., the Third Edition of

RURAL CHEMISTRY:

AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honourable East India Company's Military Seminary at Addiscombe, &c., &c.

PREFACE TO THE THIRD EDITION.

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits, Baking, Cheese-making, Cookery, &c., have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."

Published by J. Matthews, at the Office of the *Gardeners' Chronicle*, 5, Upper [illegible]ington-street, Strand, London; and may be had by order of any Bookseller.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rosé Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street Without.

Dixon v. *Bessell.*—*Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant* 60*l.*, *and* 10*l. costs, for an infringement of the Registered design.*—*Oct.* 1, 1850.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ¼ an inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

CHRISTMAS HOLIDAYS.

THE GARDENS OF THE ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY except Sunday, from Christmas Eve to January 6th inclusive.

The HIPPOPOTAMUS is exhibited from 11 to 4 o'clock.

IRISH PEAT CHARCOAL MANURE.

G. H. FOLEY, Essex Coal Wharf, Lea Bridge, Agent by appointment to the Irish Amelioration Society for the sale of the above. All Orders punctually attended to, a constant supply being kept on the premises. Further information given upon application at the above address.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 21, 1850.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Dec. 24—Zoological ..... 9 P.M.
SATURDAY, 28—Medical ..... 8 P.M.

A LEGAL friend of ours inquires whether gardening implements and contrivances are as good as they might be. And if not, why not? These questions are of some moment; they interest the public at large, and to that part of the community which is specially occupied in the cultivation of plants, the answers which must be given to them are of considerable importance. That the first question must be answered in the negative is too clear to admit of doubt. The scythe is much what it was centuries ago, and no really good means have been yet discovered by which Grass can be kept in order, without breaking the backs of those employed for that purpose. A good label, which shall be cheap, durable, and always legible, is continually asked for, but does not appear. Something has long been wanted to replace the old and shabby Thrift and Box-edgings; and yet, in these days of taste and invention, nothing has been found which is at once elegant, inexpensive, easy of application, and lasting in quality. Why is this? Is it that those who are most interested in these matters, have less ingenuity and brain than men of the same station in life, but of different occupation? We think not; we don't for a moment believe that gardeners are so much inferior in these respects to other people; nor do we believe that they are so well satisfied with what they have got, that they wish for nothing better. The causes of this apparent listlessness are to be found elsewhere; and from what quarter they proceed, we shall now endeavour to show.

Let us ask what inducement there is for any man, with limited means, to expend his time in endeavouring to supply such wants as these? Suppose some ingenious gardener were to invent an instrument to replace the scythe, a good label, or a durable and cheap edging, what would he get by it? We shall be answered, he can take out a PATENT for it, and so be remunerated. That is no doubt exactly what he ought to be able to do, but he cannot. A patent for the most simple thing cannot be obtained in this country under 99*l.* 7*s.* 2*d.*! and if the inventor wishes to have his right secured to him throughout England, Scotland, and Ireland, he must pay no less a sum than 300*l.*! If any of our readers doubt the accuracy of these statements, we refer them to the inimitable "Poor Man's Tale of a Patent," given in a late number of Mr. DICKENS' "Household Words," and to the "First Report from the Committee on Legislative Recognition of the Rights of Inventors." Here is the true secret of the want of improvement; it is because a poor man cannot afford to pay the tax on his invention that he does not endeavour to invent. "No man in this country," to borrow the words of the above-mentioned *Report*, "is in any position to claim any right whatever for his invention until he has passed through 35 official stages of cost and delay. By passing through a series of formulas, so antiquated that the origin of them is lost in the obscurity of past centuries—so empty and frivolous that common sense revolts at them — so numerous that they can hardly be reckoned accurately — so intricate, that every one seems a pitfall to discourage scientific invention to the utmost — so inexplicable, that the greatest diversity of opinion obtains in interpreting them—so costly, as to place scientific intelligence wholly within the powers of capital; an inventor may at last obtain a mere recognition of his right, which he *is then at liberty to protect as he may be best able.*" Let our readers mark these last words. After all the expense, useless forms, endless trouble, vexatious delay, and almost insuperable difficulties have been borne and overcome by an inventor, he is rewarded with—what? A Parliamentary title to his invention which is declared good against all the world? A right to his invention similar to that which a lucky finder has in any valuable article he may have found? Not at all; he is rewarded with a license to enforce, *if he can*, a right not before recognised by the laws of his country, but which is nevertheless founded upon every principle of natural and moral justice. That is all he gets, and for this precious license he has to pay the enormous sum of 300*l.*

The iniquities of the Palace Court brought upon it a righteous judgment not long since, and it has disappeared from the tribunals of this country. The iniquities of the system of English patents have been exposed in all their deformity by the author of the article in the "Household Words," and we sincerely hope, and most assuredly expect, soon to see the doom of the present patent absurdities. Will it be believed that no inventor can obtain even the license before referred to without the permission of the Attorney or Solicitor-General, who can grant or withhold such permission at their pleasure, and from whose whim there is no appeal? These high legal functionaries have far too much to do to inquire into the merits of any invention submitted to them for approval; and even if they had the time, their previous studies are not such as to enable them to come to any satisfactory conclusion upon the subject. As it is, the whole proceedings are a farce, which amuse those who take the fees, at the expense, and often ruin, of the inventor. Is this right? In the firm conviction that the evil has only to be more extensively known to cease altogether, and that its abolition would materially benefit the condition of those whose interests this Journal is ever ready to protect, we have thought it our duty to take some notice of the present state of patent law.

The reform of these abuses has been taken up by the Society of Arts. A report, already referred to, has been published by a committee appointed by them, embodying the principles upon which the reform is to be conducted, and the alterations proposed to be made. These principles are: "1. That inventors, &c., ought not to be subjected to any other expenses than such as may be absolutely necessary to secure to them the protection of their invention. 2. That the difficulties and anomalies experienced in connection with patents should be removed. 3. That there should be penalties for using the title of 'patent,' or 'registration,' where none has ever existed."

So far so good. No doubt the true principle is, that no inventor should be compelled to pay anything more than is absolutely essential to secure his right. No doubt the difficulties and anomalies of the present system should be swept away. No doubt there should be a penalty for using the title of "patent" or the catch word "registered." This we look upon as a most important point. How many people not alive to the tricks and audacity of less honest persons than themselves are taken in by the high sounding words "by Her Majesty's Royal Letters Patent;" "registered according to Act of Parliament," &c., &c., which are as often assumed by those who are not, as by those who are entitled to use them.

The 4th and 5th principles laid down by the committee are as follows. "4. That registration of inventions shall be obtainable for a period of one year, on payment of 5*l.*, and shall be renewable for four periods of five years each, on payment of 10*l.* at first renewal, of 20*l.* at second renewal, of 50*l.* at third renewal, and of 100*l.* at fourth renewal. 5. That the surplus profits, after paying office expenses and compensation, shall be directly applied to some public purpose connected with invention, but not carried to the Consolidated Fund." With the first three principles we have, as we have said, no fault to find; but we confess that we are at a loss to know on what principle of justice the fourth is founded. On what ground is a person whose invention turns out to be really worth renewal to be fined 10, 20, 50, 100 pounds for the benefit which, thanks to his labours, the public enjoy? According to this plan, the better the invention, the more beneficial it is to the public, the more heavily is its author fined. Why is a man to be taxed 185*l.* for the enjoyment, for 21 years, of a right called into existence by his own labour and ingenuity? Were it not for the high character of the gentlemen who drew up this report, we should be inclined to think that they were interested in the maintenance of the fee payable to the "deputy chaff wax." It is ridiculous to suppose that 185*l.* is necessary to secure to a man the protection of his invention. It is rather too bad to recommend such a confiscation of property. A person who writes a book has not to pay 185*l.* for a copyright, and on what ground is an inventor to be compelled to pay this enormous sum for a patent? The committee does not propose to give the patentee any greater right than he has at present; for his 185*l.*, he is to have the very same license of which we have already said sufficient. He is to enjoy his right, *if he can maintain it against all the chicanery of adverse claimants.* A man who takes out a patent should be called upon to pay nothing whatever, or at all events no more than some small fee, which should be applied for the purpose of defraying the expenses of an annual authentic list of patents and the salaries of the clerks who arrange and take care of the specifications. An inventor should be able to take his invention to a patent office, deposit an accurate description of what he wishes to have patented, be compelled to swear that he believes himself to be the true inventor, pay some small fee, say a guinea, on the deposit of his specification, and depart with as much as he gets now for 300*l.*, or as he would get under the proposed alteration for 185*l.*, namely, a right to make the best use he can of what he has invented.

What need is there of more? Such a fee, added to some small payment to be made by every one who wishes to examine any document, &c., in the Patent Office, would be amply sufficient to defray the expenses of the establishment; and nothing more should be aimed at. An inventor would then in reality pay for no more than is absolutely essential to his own protection. And until some such plan be adopted, until a stimulus be really given to invention, until an inventor can by the very act of invention acquire a right to what he has invented, the patent laws of this country, however they may be patched up, will always be so great a clog on ingenuity and such a bar to improvement that, for ourselves, we would as lief see them continue to remain what they now are.

CIRCUMSTANCES have rendered it necessary to modify the intentions expressed at p. 676 respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these 5 guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of NORTHUMBERLAND, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway,

where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. William Brailsford, who, upon their receipt, will return an order upon Mr. Rivers for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use; yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

N THE ASSIMILATION OF NITROGEN FROM THE AIR BY PLANTS, AND ON THE INFLUENCE OF AMMONIA IN VEGETATION.

By M. Ville.

Many years ago, M. Th. de Saussure remarked that a solution of sulphate of alumina became, if exposed to the air for a sufficient length of time, converted into ammoniacal alum. This observation, made in the year 1804, demonstrated the existence of ammonia in the atmosphere. Since the time of M. Th. de Saussure many chemists have endeavoured to ascertain the quantity of ammonia that exists in the air by more expeditious and more exact methods. The importance attributed by physiologists to ammoniacal compounds in the development of plants was the cause of these endeavours made by the chemists. It is the general opinion that the source from which plants derive their nitrogen is ammonia existing either in the soil itself, or in the manure laid upon it, or in the atmosphere.

After having satisfied myself, by a long series of experiments made on much larger quantities of air than have been analysed by my predecessors, that the quantity of ammonia in the atmosphere is scarcely appreciable, if pains be taken to avoid sources of error which may be caused by accidental emanations of the gas, I was led to doubt the reality of the influence attributed to ammonia in vegetation.

To clear up these doubts I sowed a certain number of seeds in a mixture of equal quantities of white sand and brick-dust, which had been previously calcined, for many days, in a porcelain furnace, in order that all organic matter in them might be utterly destroyed. This mixture was placed in a certain number of pots, and to it was added 5 per cent. of ashes obtained by the combustion of the plants with the seeds of which I was experimenting. The pots were placed under a bell-glass, hermetically sealed. The air inside the glass was renewed every day by means of a very large aspirator (containing 631 litres at zero, under a pressure of 760). But as this quantity of air, though large, did not contain sufficient carbonic acid for the purposes of vegetation, 5 and afterwards 7 per cent. of this gas was added by means of an apparatus from which the gas escaped bubble by bubble, during the whole of the time occupied by the renewing of the air. The air which came out from the bell-glass was conducted into an apparatus in which all the ammonia present in the air was separated from it.

Thus two experiments went on at the same time; in the first I dosed the ammonia with a certain quantity of pure air; and in the second the ammonia with a nearly equal quantity of air, which had nourished the plants under the bell-glass. By comparing the results of these two analyses, I was enabled to see whether the ammonia of the air had taken any part in the development of the plants. On the other hand, by previously analysing a certain number of seeds similar to those with which I was experimenting, I ascertained how much nitrogen was introduced under the bell-glass in the seeds. When the experiment is finished, I shall be able to ascertain, by similar analyses, the quantity of nitrogen contained in the full-grown plants, and consequently the quantity of nitrogen assimilated during the experiment; and from that again, whether this nitrogen was derived from the ammonia or the nitrogen of the air. [This is an exact translation of the original; but its meaning is very obscure.]

Although the plants have not yet been taken out of the apparatus, the question may be considered as determined. It is quite clear that a certain quantity of nitrogen has been assimilated by the plants, and this nitrogen was derived from that of the air; for the plants, under the glass, have become developed in a remarkable degree, and the air on coming out of the bell-glass contains just as much ammonia as it did on its entry. Moreover, had the ammonia of the air been wholly assimilated by the plants, this conclusion would not be invalidated, since the quantity of ammonia introduced by the air, during the four months the experiment has been going on, does not exceed ·75 or 1·15 grains, a quantity too small to have had any considerable influence.

So that the consequence to be deduced from the mere inspection of the bell-glass is that the nitrogen of the air has been directly assimilated by the plants, and that the ammonia in the air has had no sensible influence. This being ascertained, I next proceeded to determine the influence that a given quantity of ammonia, added to the air, would in its turn have on vegetation.

For this purpose I got more of the seeds on which the first experiment was made, and put them in pots under a bell-glass as before. The air inside the glass was renewed, and 5 and afterwards 7 per cent. of carbonic acid was added as before. In short, the only difference was that in this new experiment a certain quantity of ammonia was daily introduced under the bell-glass.

From the very first day, the influence of the addition was manifested. The leaves of the plants became tinged with a fresher and brighter green; the stems rose higher, the branches more numerous, had more leaves; all the plants however were not affected to the same degree, the greatest change being observed in the cereals.

In pure air the cereals were sickly, blanched, their stems laid down instead of growing upright; in air containing ammonia, they were strong, straight, and from their upright stems sprung numerous leaves. So that a second conclusion may be drawn from the mere inspection of the apparatus, viz., that ammonia is favourable to the development of plants, and more especially to that of cereals. *Comptes Rendus.*

AN IDEA FOR A WINTER GARDEN.

Everybody complains of the barren and uninteresting appearance of the flower garden in winter and early spring. The gay parterre, which in summer boasts of every hue, is tended with the greatest care, the "observed of all observers," becomes, after a few short weeks, a barren waste; and, as far as its real object is concerned, a sinecure. Its epitaph might with propriety be written, "flat, stale, and unprofitable."

At various times, and in various periodicals treating on gardening matters, suggestions for obviating this have been thrown out; but the thing never appears to have been taken up with spirit. Surely it offers a wide field for inquiry, and one on which the results cannot but be profitable to all concerned. A winter garden is a desideratum. We cannot hope to make

"Winter wear a wreath of summer flowers,"

but we have at least the means of binding about his barren temples a garland of evergreens, gemmed with a few stray florets, pale though they may be. Appropriateness in garden scenery is one of the first matters claiming attention. Gay flowers and dripping fountains would be out of place in winter, even if we could command them in the open air; but a collection of such attractive plants as put on their gayest dresses at that season, must be to all lovers of gardens a thing to hope for, and to admire when obtained.

There can be no reason why a garden establishment should not have its reserve garden for such plants, equally complete and equally cared for with the frames and pits of Verbenas, Pelargoniums, and the thousand and one kinds of tender exotics destined to exhibit their beauties beneath a July sun. And why should we not prepare for bedding out in November with equal alacrity as in June? In a list which I shall append is an array of names, the representatives of such plants as appear to me suitable for a winter garden. Others will suggest themselves to the readers of the *Chronicle* more *au fait* in such matters than myself, and if the thing was once warmly taken up by some of our best flower-gardeners, we should not long have to complain of barren flower gardens in winter. In removing the plant from the reserve garden to the flower garden, and *vice versa*, season need not be considered as offering an objection. Plants constantly being removed never, under the most ordinary circumstances, suffer from the treatment. And a bed vacated to-night by frost-bitten Heliotropes may, ere the inmates of the mansion look upon the spot to-morrow, be occupied with Gaultheria procumbens, or some other evergreen appropriate to the situation. It would be impossible to offer any practical hints as to the proper situation for any given evergreen in arranging a winter garden. Situation, circumstance, and individual taste, will determine that. My principal object on this occasion is to draw attention to the subject. That once obtained the thing is done. One or two general observations may, however, be given in introducing such flowering herbaceous plants and bulbs as may be considered necessary, or taste suggest. I imagine that by interspersing them amongst the dwarf young evergreens, or on the margin of the beds of the tall ones, a more pleasing effect will be produced than by massing them, unless perhaps exception be allowed in Anemones, Hellebore, and a few other such plants. Gayness, however, should not be the object aimed at. An interesting assemblage of plants is all that can be hoped for: to attempt beyond this would probably lead to effects which must, from the very nature of things, prove abortive. Under any circumstance a change in the winter aspect of our flower-gardens, as they are usually found, must be for the better, with perhaps one exception, that of sticking the beds full of branches of shrubs, in lieu of the living plant. In the subjoined list some slight arrangement is preserved. But any of the taller growing plants could easily be kept dwarf, without formality, by a judicious application of the pruning-knife. In an article, by Messrs. Standish and Noble, of Bagshot, which appeared in a recent Part of the "Journal of the Horticultural Society," allusion is made to a remarkably dwarf section of Rhododendrons, some of which have variegated foliage, and all a very compact habit. I have seen some of them in the nurseries alluded to, and think they would form excellent auxiliaries in forming a winter garden. They are of various colours, and the greater part of them are in bloom in April. They can be removed as soon as the flowers are faded, or where circumstances may require. As they would not remain, to complete their growth, beds of peat need not be provided for them. In the parterre they would only develop, in the form of flowers, matters stored up during the previous season's growth. In the reserve garden, of course every facility would be afforded them for growth, and to meet the requirement of the ensuing flowering season.

Subjoined is the list previously alluded to:

Dwarf Evergreens.	
Variegated Ivies	Gaultheria Shallon
Polygala Chamæbuxus	Epigæa repens
Erica carnea	Juniperus tamariscifolia
Pernettya mucronata	„ squamata
Daphne hybrida	Arbutus pilosa
„ japonica	„ sibirica.
Taller Plants, which may be grown to suit various heights.	
Andromeda floribunda	Arbutus unedo
Berberis fasciculata	Ilex (variegated)
„ Aquifolium	„ latifolia, &c.
Aucuba japonica	Quercus Ilex
Laurus nobilis	Ruscus aculeatus
Juniperus virginiana	„ ramosissimus
Thuja Warreana	Rosmarinus officinalis fol. argenteis
„ aurea	Do. do. aureus
Vaccinium ovatum	Rhododendron dauricum atro-virens
Taxus baccata variegata	Euonymus japonica
Buxus vulgaris	„ „ variegata.
Gaultheria Shallon	Daphne collina
Cotoneaster microphylla	Cydonia japonica.
Jasminum nudiflorum, for its early flowers	
Herbaceous Plants, &c.	
Alyssum saxatile variegatum	Aconitum hyemale
Helleborus viridus	Anemone hortensis
„ nigricans	„ nemorosa
Galanthus nivalis	„ in varieties.
Scilla verna	Crocus sativus

BRITISH SONG BIRDS.

No. X.—The "flight" birds, when first purchased, should be classified—linnets together, in one very large cage; goldfinches, in another of the same size; and so on with any others. The reason for placing them in large cages is—to prevent their soiling each others' plumage, while dashing about in their new prison. Every prisoner when first confined is so truly "unhappy in his mind," that it is in vain to attempt to soothe him. Grief, however, having exhausted itself, and Nature having at length induced an appetite for food, he becomes by degrees more reasonable, and finds discretion to be by far "the better part of valour."

The "flight" birds, when fresh caught, must have a mixture thrown into the bottom of their cages of Canary, Flax, Rape, and bruised Hemp-seed, the floor being covered with dry, gravelly sand. Their cages, for a few days, should be kept partially darkened; and during this time the birds should be as little disturbed as possible.

It is always desirable to keep newly-caught birds very scantily supplied with food, giving it them only at stated intervals. They then get accustomed to look for it. They must however have plenty of clean water at all times. By this mode of treatment they will become reconciled to their fate. They should then be introduced into the commonwealth, one or two at a time, early in the morning, and when the others are feeding. In Number VIII. of the present series of Papers, I recommended the introduction of only one pair of birds—wagtails. I now bethink me of an almost unpardonable oversight in this matter—I mean, with respect to not having recommended the addition of a pair of Java sparrows. They are so quiet, so innocent in their nature, so totally different and retired in their habits from all other birds, and so hardy withal, that I again repeat,—by all means try a pair of them. They are granivorous, but will eat freely of the universal mixture. I had a pair of Java sparrows in my aviary four years. Their symmetrical proportions were exquisitely beautiful. At the end of the fourth year the hen died; the widower from that moment became inconsolable. His grief was lasting, and excessive. Such constancy won my best sympathies. I procured another hen, equally beautiful, and gave her the *entrée*. Singular to relate, her ladyship intuitively seconded my views. My lord "proposed," at an early day, and was "accepted;" and the twain lived with me, in uninterrupted felicity, until they were devoured by the rats. The "habits" of this bird will receive ample notice.

As the larger proportion of number will always be in favour of linnets and goldfinches, I need not say anything about the introduction of other kinds of birds. In this matter, everybody will of course consult their own particular fancy. It will be desirable, however, to confine new comers of every sort, for a day or two, in a separate cage; they may then be turned in with the rest. It sometimes happens that a bird gets one of his legs injured, and he is thereby prevented rising on the wing, and seating himself on a perch. To accommodate him in his sickness, let a perch be fixed across the skirting board at every corner of the aviary. On these he can hop, and on one of them he will roost at night. It is highly desirable for every bird to perch when at roost. They do so when in a state of Nature. It prevents their little feet becoming clogged with any foul matter, and they awaken refreshed by their night's rest.

Sometimes, in the moulting season, when a bird does not moult "kindly," there will be several "cripples" trotting about the floor, quite unable to soar aloft,

Under such circumstances you must place clean water within their reach, and plenty of food—the latter in as great a variety as possible. What this variety consists of, we will discuss anon. I must here caution my readers against the sudden introduction of a lighted candle, into or near an aviary, at night. It has so alarming an effect upon the inmates, that they will precipitate themselves headlong from their perches, and fall about the room in an agony of fear. I have known many legs and wings to be broken in this manner, and have been obliged to sacrifice the lives of many of the sufferers by putting them to a premature death. The birds usually roost up aloft; so that, with only moderate care, the evil complained of can be remedied.

Another terrible annoyance and cause of alarm to your birds, on moonlight nights particularly, will be the CATS, which will, and do, always prowl about an aviary; assembling in numbers to try and procure a savory meal. *Apropos* to this subject. On one particular occasion, coming down early in the morning, I found a pane of glass in the aviary, broken. There was a circular hole through it, made as if it had been "drilled." Round it was a quantity of grey hair, *not* human; through it, something alive, also not human, had evidently passed. How many of my feathered family had escaped through this aperture, I had no means of ascertaining; but I heard many ill-suppressed whispers of some splendid mules and canaries having suddenly made their appearance in cages in the neighbourhood, and of the welkin ringing with their song. It being an invariable rule with me to live "out of debt," I proceeded at once to discharge this last outstanding obligation. I was plainly indebted to one of the feline tribe for the unsolicited honour of a visit. Too well bred not to acknowledge the civility at an early moment, I that same night prepared a *petit souper* for the visitor, dressed *à la Soyer*, the paragon of all human excellence.* The cloth was laid for a dozen at least; for I thought it probable that a friend or two might drop in. I was not "out" in this my calculation. My polite neighbours, the cats, *did* arrive, and with good appetites; nor were they dainty. Partaking *avec gout* of all that I had provided for them, they cleared the course. No "remove" was needed! Contrary to all good manners, I must remark, the party, before breaking up, had actually licked their plates.

Next morning, there was a rumour that "14 cats had been mysteriously seized with sudden and alarming illness."—"*Is* it possible?" replied I to my informant, with the interesting gravity of a Janus.

Two days subsequently—a most "remarkable" circumstance—I was apprised of the very same number of equally mysterious "deaths."—*William Kidd, New Road, Hammersmith.*

VILLA AND SUBURBAN GARDENING.

WINTER Rhubarb, when produced in perfection, is a delicacy which most people enjoy; much, however, of that which is forced for Covent-garden Market, under the influence of strong fermenting beds of stable litter, is anything but finely flavoured. A strong taste of the fermenting material is obviously perceptible to the palate. The obtaining the fine taste which distinguishes clean forced Rhubarb from that just alluded to, is a thing that eminently deserves the attention of all who cultivate what is required for their own private use.

To produce Rhubarb in perfection a deep rich loamy soil is to be preferred. The ground should be well and deeply trenched, and the plants put out in March. The system of planting should be in rows, at least 4 feet apart, and the plants should be placed 3 feet from each other in the rows. An early variety should be preferred for forcing. I have proved Wilmot's Early or Mitchell's Royal Albert to be excellent kinds for winter use, and, if the soil is in high tilth, one season will produce them sufficiently strong for the purpose. The roots should be carefully taken up; the less injury inflicted upon them in this operation the better; therefore a deep trench should be first taken out all round each crown, and the root carefully undermined. I have for some years had an ample and regular supply, the produce of a few roots placed under the front stage of an intermediate house. They are placed close to each other, and are merely covered with a little light dry soil, no other care being requisite. The first planting takes place in November, and this is succeeded by a second in February. These two plantings usually afford sufficient for a small family, and in the highest perfection, with the least possible trouble.

Seakale is also grown in a similar manner; but this requires a deeper covering, in order that the stalks may be blanched. The importance of such places is not sufficiently appreciated; if fully taken advantage of, a regular supply of Salads, Mushrooms, &c., might be kept up throughout the winter and spring months at little trouble or expense. The space under a plant stage can be of little other use, and if thus taken advantage of, it is quite astonishing what positive luxuries may be raised there. I always look upon the under part of my stages as being, during winter, quite as important as the top. Now, such places are usually either left unoccupied or kept as a kind of rubbish hole, whereas at the present time all behind my hot-water pipes are rising quantities of Seakale and Rhubarb, which generally maintain a supply until it comes in naturally. I never force either of the above in the open air under dung coverings, having an impression that the flavour is thereby very much deteriorated. Seakale, if covered with dry sand about a foot, and allowed to grow with the natural season, will always be infinitely superior to that produced under the steaming influence of stable dung. *Pharo.*

* The *carte*, or bill of fare, was too choice not to be preserved. I have a "copy" of it, and it will appear in a future chapter, under the head "Vermin." It should be, and no doubt will be, highly prized; for many a receipt, of not one-quarter its value, is usually charged a guinea.

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND;

OR, TWO BIRDS KILLED WITH ONE STONE.

[FOR COTTAGERS.]

CULTURE OF THE MIND.

No. VIII.—CONCLUSION.—Some one, perhaps, will say, "This is all very well, but it is a great deal more trouble than it is worth; besides, I have not time. A very pretty amusement for those who have nothing better to do; so there's an end to the matter." Not so fast, my friend; first be pleased to recollect that what is here put down, though it may seem a good deal in a lump, is to be spread over a good many years of 365 days each; a good deal of time to do a good deal in.

The lazy man exerteth himself to find excuses. Who are they? The compiler answereth in eight propositions.

2*dly*. When it is well done, the greater part is done for life; more, it will be a living memorial of industry and worth, more useful and lasting than a tombstone.

To everything there is a season, and a time to every purpose under the sun. Well begun, half done. A type of a well-spent life, the older, the more and better fruit does it bear.

3*dly*. Nothing good is given to man without labour.

An old saw that is not too rusty, but that it will still cut.

4*thly*. Labour makes a man; idleness fattens a pig.

"O Lord my God, how many and how rare
Are Thy great works! in wisdom hast thou made
Them all; and this the earth and every blade
Of Grass we tread declares."—*H. V.*

5*thly*. It will give a higher standard of general cultivation, a greater interest in all the works of Nature; increase observation; teach the wonderful laws by which God is working at all times, and in all things, and in all places; and induce a habit of thankfulness for His Gifts.

Idleness is hard work for those who are not used to it; dull work for those that are.

"But let us ever praise Him, and extol
His bounty, following our delightful task,
To prune these growing plants and tend these flowers,
Which, were it toilsome, yet with thee were sweet."
Paradise Lost.

6*thly*. The labour is at home, it may be, with the assistance of wife and children.

7*thly*. It makes home look cheerful and comfortable.

The argument toucheth the lazy man more nearly; he yieldeth; he taketh a spade; he planteth a Vine.

Lastly. Grapes are very pleasant things to eat; are very wholesome; can be made into wine, or turned into money; all or either of which are worth some labour.

But every man to his own taste: the sow to the mire, the dog to his vomit.

If you now think it too much labour, then go and eat (but not Grapes), drink (but not wine), sleep (if you can, without labour), and be miserable.

"Let us then be up, and doing,
With a heart for any fate;
Still achieving, still pursuing,
Learn to labour, and to wait."—*Longfellow.*

The compiler maketh a clean breast.

A few parting words. The compiler (for he does not aspire to the dignity of authorship, seeing that the main treatise is taken mostly from one, the marginal remarks from any man) is desirous of showing his honesty, both for the pleasure such an honourable feeling naturally produces, and also by following an old proverb, to be beforehand with any would-be sharp-sighted and benevolent person; and therefore readily confesses that the instructions herein contained are not the offspring of, though proved by his own experience; but that they are the gleanings of two excellent books on the Grape Vine.

He recogniseth the proverb that, Honesty is the best policy. And, moreover, acteth accordingly.

He believeth that though stolen fruit be sweet, yet that it doth oftener engender an indigestion in the stomach and a vomit.

The compiler's work is now finished, and he will feel perfectly satisfied with the result, should it be found generally useful. His readers have his good wishes, that they also may receive the fruit of their labours in the long enjoyment of more plentiful, finer, and sweeter Grapes.

To his honesty is added generosity.

"To meales when thou dost come, give Him the praise
Whose arm supply'd thee; take what may suffice,
And then be thankful; O, admire his ways
Who fills the world's unempty'd granaries!
A thankless feeder is a thief—his feast
A very robbery, and himself no guest."—*H. V.*

Thus in mutual satisfaction he wishes to part good friends, with a hope that, should occasion arise, their chat may some day be renewed; in the meantime he bids them all God speed. *C. A.*

He thinketh that good words cost nothing, but may gain him friends.

Home Correspondence.

Dendrobium nobile.—A handsome plant in bloom of this fine Orchid is at all times a desirable object to those who are fond of flowers, but much more so when it is made to produce its hundreds of blossoms at this time of the year, when it has but few rivals. Many imagine that this Dendrobe will soon become very common; but when they are told that it requires three years to bring a small plant into anything like a flowering state, perhaps they may be induced to alter their opinion. My method of cultivating it is as follows:—Let us suppose that we begin with a plant obtained from a nursery or elsewhere in January. I place it at once in the warmest end of the Orchid-house or stove, and give it every encouragement by means of liberal waterings and shiftings. When the young roots grow over the rim of the pot, I crock another pot well, and use nothing but peat for the roots to grow in, beating out the greater part of the earthy matter before using it. I keep the plant growing in this way for about 20 months, when it ought to have from 12 to 20 shoots or pseudo bulbs, about 2 feet long. When it has attained this size, my practice is to remove it in September from the Orchid-house to a cool dry Vinery. If wanted in bloom at Christmas, it is kept there for two months quite dry, by which time flower buds make their appearance. It is then (November) taken back to the house from which it was brought, care being taken not to give water until the flower-buds are distinctly apparent. Afterwards it receives a plentiful supply of moisture, and in about a month from this time, the care and attention bestowed on it are rewarded by the expanding of nearly 200 beautiful blossoms, after which the same treatment is again pursued. The temperature I grow it in is from 55° to 70° in winter, and 70° to 90° in summer. *Rusticus.*

Victoria Park.—Allow me to offer a few remarks upon the system which appears to have been carried out in producing the meanly planted ground called Victoria Park, which from the name it bears should have equalled, if not excelled all other parks; but instead of this it is quite in keeping with the miserable ground which approaches and surrounds it. The consideration of the large sum expended in forming this so-called park reminds me of what I saw when visiting a nursery near London, about the latter end of October, or the beginning of November last; this was, four men carrying one ordinary sized evergreen, slung to two poles, the ends being placed upon each of their shoulders. I considered this an expensive mode of removing a *number* of evergreens, and it naturally excited my curiosity to know where the said tree was intended to be planted. I was informed in the Victoria Park. Upon my next visit to the same ground, the same process of removing evergreens was being carried out, and I found it had been continued nearly a fortnight. The cost for removal must have doubled the purchase-money. At that time I bought 12 trees of the description of that in question; I had them removed by a cart, a distance rather more than that to the park, and the cost was only 2*s*. 6*d*., including toll; the time therefore occupied by four men in conveying one tree must have caused it to cost quite as much as my twelve. Such is the system in which public affairs are generally managed, and what is everybody's business is no one's business; if it were otherwise things would be better done, and at less expense. I should not have troubled you with the above had I not considered your complaint made against the appearance of the park quite justifiable. *Wm. Statham, De Beauvoir Town, Dec.* 18.

Garden Gossip.—Does any correspondent, or reader of the *Chronicle*, bloom Bignonia Tweediana freely? If so, will the successful cultivator give his mode of treatment? For several years, a plant has been rambling over the arches of my conservatory, and among the branches of its neighbours, without producing more than one solitary flower when, last spring, early in the season, my gardener vigorously root pruned it, which, during the past summer, caused it to bloom a little more freely, but not so as to render it a desirable conservatory climber. Did it flower abundantly, it would be a truly valuable plant, as its blossoms are of the richest golden yellow, a hue uncommon in creepers of its class. Two of my flowers have produced seed-pods, in shape like a slender French Bean, one of them about 15 inches long, which is not yet ripe. Among conservatory climbers, I should think Tacsonia manicata, which is so well figured in "Paxton's Flower Garden," will take a prominent position, if it does not prove too tender for the majority of such structures. I am led to make this remark, from the plant I received from the Horticultural Society, exhibiting a very unsatisfactory appearance, in the same house, and against the same pillars, where Tacsonia mollissima and pinnatistipula grew in wild luxuriance, both of which I discarded, from the determination of one species not to bloom at all, and the other to produce flowers too sparingly for my satisfaction. In this conservatory, T. manicata has dropped its leaves, and gives evident tokens of not being in a genial climate. Has this been noticed elsewhere? In speaking of climate, I am led to make a passing remark on that of South Devon; at the present time we are experiencing tremendously stormy weather; the squalls of wind, accompanied by rain, thunder, and lightning, are carrying off slates and thatch, blowing down trees, living and dead, and making nervous invalids tremble; yet we have scarcely had any frost, such as to injure tender plants in sheltered situations. Against my own house, Ipomœa Learii is as fresh and green as when first planted, though it has disappointed my hopes in not flowering; and my gardener brought me a bouquet a few days since, to send to a relation at a distance, such as would have been com-

mended three months ago; it consisted of Carnations, Tea and China Roses, rose-scented Geranium, scarlet Geraniums, Heliotropes, Cupheas, Verbenas, and Calceolarias, all from the open ground, while from a wall, protected by a straw frame, he added huge bunches of Habrothamnus elegans. To these the gay Jasminum nudiflorum was a good addition, and the whole was rendered gorgeous by many flowers of Rhododendron Nobelianum, of which several plants are blooming luxuriantly. *Devonian, Dec.* 16.

Conifers.—I am very glad to find that the Horticultural Society has issued, in its Journal, a catalogue of Coniferous plants, with their synonymes. Such a catalogue has been sadly wanted for a long time; and although this may not, in the present state of our ignorance of Coniferæ, prove wholly free from error, it does come before us with a satisfactory degree of authority, and cannot fail of doing great service, and proving a generally safe standard of reference to both buyers and sellers, and, in fact, useful to all who take delight in this most interesting tribe of plants. To show the want of some such authoritative catalogue, I have now before me a catalogue of Coniferæ, sent out by a very respectable nurseryman; in that catalogue I find Pinus Pallasiana, grafted, price from 15*s.* to 21*s.*; a little lower down, Pinus taurica, 3*s.* 6*d.* Now, if the Horticultural Society's catalogue be correct (as I for one believe it is), these two are identical; and surely, no lover of Pines would care to give from 15*s.* to 21*s.* for a worthless grafted plant (and grafted Pines are always absolutely worthless in comparison with seedlings), when for 3*s.* 6*d.* he could procure a healthy seedling of the very same species, without any really permanent difference; and even if there be any trifling difference, so slight as to be of no real account or value, for use or ornament. Loudon makes P. taurica a mere variety of Pinus Laricio, but so he does P. pyrenaica; but more is known about species now than when he compiled his very useful Arboretum. I see Messrs. Lawson, in their list for 1850, sell their P. Pallasiana grafted at 21*s.*, and taurica at 2*s.* 6*d.*, so that I imagine the real identity of the two is not sufficiently known; but I trust the Society's catalogue will now set this matter at rest. *D.*

Public Parks.—Every one having a feeling for his country must be thankful to those who will keep in view the abominable bad taste everywhere bearing evidence of the hand of our irresponsible boards, but most especially shown in the works of the Woods and Forests. When at the Tuileries gardens, every one laughs at the unhappy swans in their wash-hand basin and "green" room; but few Englishmen can laugh at an Austen and Seely tazza fountain in the midst of a pond, as at St. James's, or at the curious collection of things on the Serpentine. First of all a gothic bridge, then an Italian, then a Swisso-gothic boat-house, a cold brick Italian receiving-house, and lastly an iron railing over an Alpine cascade!! The lodges to Kensington Gardens are also exquisite specimens of good taste—rough-bark pillars to smooth white walls, rough variegated tiles with lead hips!! something very like the Ashantee's top-boots and cocked hat—*et prætera nihil.* Now St. James' and Kensington Gardens are much frequented by foreigners, who naturally form their ideas of our taste by our public walks and buildings, nor can any one persuade them that the idleness of irresponsible magnifico allows the toadies and vulgar people always about such persons to show their bad taste, and expose us to such unjust criticism. Do pray preserve the new park from such desecration. You have evidently moved the northern to shame, try the same on the south. *A Disciple of Gilpin, Winscombe, Dec.* 16.

Bulbs in Water.—In a leading article in the autumn of 1844, you give instructions for the cultivation of the above; one essential being, that the water should not be within an inch of the bulbs. I tried three Hyacinths according to the plan laid down. I looked at them in three weeks' time; one had made roots half an inch long, one about a quarter of an inch, the other had not started at all; all were mouldy. I wiped them carefully, and put them in their cupboard again; in three weeks more I looked again. The roots that had shown themselves previously were rotting off, and the bulbs themselves were beginning to go also. Where is the mistake? for I followed the instructions closely. Should I not have filled up water to meet the descending roots, though not so far as to touch the bulb? *S. R. F.*—[It was not meant that water should always be kept at a distance from the bulb, but that it should not touch the bulb until roots had formed. At that time the points of the roots should be allowed to dip into the water. A little warmth much facilitates the rooting process. Our correspondent is doubtless aware that under all circumstances some bulbs will become mouldy, whatever be the treatment they receive. The best way to deal with them is to put them in damp charcoal powder, as soon as the mouldy tendency is ascertained.]

Royal Botanic Garden, Edinburgh.—Your Celtic correspondent, Dougall Mac Ivor, appears to be very much offended at "Dodman's" remarks respecting this Botanic Garden. Although a North Briton, and probably having as much national pride as Dougall, I feel rather pleased with the notice in question, and I hope that it may induce a more liberal spirit in those who have the management of its affairs. I have called there on several occasions during the late Mr. MacNab's time, and I never was refused admittance when I named the place in which I was employed. Being in Edinburgh in September, 1849, I called at the Botanic one Saturday morning, between 10 and 11 o'clock. Not being aware that the public was admitted, I asked permission of Mr. MacNab to look over the Garden; he told me he could not grant it, but that any one would be admitted at 1 o'clock, when I might come in. He said if he made any exception in my favour, the public might expect the same. I have been informed that if a gardener applies at Kew, under similar circumstances, he is not refused admittance; but not having had occasion to try, I cannot speak with certainty as to the truth of the information. I would advise Dougall, however, to put his house to rights, in case "Dodman" might call again, when, instead of getting holes made in his skin, he might tell the public of some he found in Dougall's. Perhaps it might be acceptable to some of your readers, if the latter would send you a description of the winter garden, of which he thinks so much, and let us know what good things he may have in flower there at this season. As the majority of people, however, do not understand his dialect, he had better use plain English, and I have no doubt he is as well versed in the one as the other. *G., Hammersmith.*

Cultivation of the Gooseberry in Lancashire.—I am told that it is the practice of the market gardeners in Lancashire, to plant their Gooseberry-trees as follows: they tread the ground and plant on the surface; put one inch or two of soil over the roots, stake the plants, and give a little more covering in summer. After they have taken root, in November or so, they uncover the roots, or nearly so, exposing them to the frost, and covering them again in spring; by this treatment they consider they obtain larger fruit, and less unnecessary wood. Have the goodness to inform me of the philosophy of this treatment. *A Reader.* [We must refer this to the Lancashire gentlemen themselves.]

Comparative Temperatures of Holkham, Norfolk, and Chiswick.—The following is a comparative table, showing the minimum thermometer readings at Chiswick and this place, taking the former from the last four weeks' register in the *Chronicle.* The discrepancy in the two series of observations is so considerable, that I am quite at a loss to account for it by any difference of position or locality; and my object in laying the statement before you is, to learn if you can assist me in solving the difficulty. Our instruments are first-rate, having passed the ordeal of an examination at the Royal Observatory, and I pledge myself that the observations of them are strictly correct. The temperatures in our return upon each day, are those observed at 9 A.M. on that day, as the lowest in the preceding 24 hours (the lowest temperature of a day being found to occur just previous to sunrise), whereas I imagine that the figures inserted in your return are those observed on the following morning, as the lowest in the 24 hours; as, for instance, the temperature inserted on 8th November, was not observed until the morning of the 9th. This will bring the two returns to a near approximation, but there will still remain the remarkable differences of the 8th, 12th, 13th, 14th, 16th Nov. and 3d Dec., while in the other case there would also be those of 9th, 18th, 21st, 22d, 25th, 28th, 29th Nov., and 5th Dec., to explain away. Subjoined is the table alluded to.

	Chiswick.	Holkham.	
	In the Air.	In the Air, protected from Radiation.	On Grass, exposed.
November 8th	29	42.7	37.5
„ 9th	50	40.8	35.8
„ 10th	46	44.3	42.0
„ 11th	48	47.8	42.8
„ 12th	26	46.6	40.4
„ 13th	24	37.2	30.2
„ 14th	19	38.0	29.6
„ 15th	31	31.8	25.5
„ 16th	29	35.7	30.2
„ 17th	35	40.2	34.0
„ 18th	45	37.7	30 0
„ 19th	42	39.9	38.2
„ 20th	43	44.8	40.3
„ 21st	30	43.8	39.3
„ 22d	44	32.2	26.4
„ 23d	39	39.2	35.4

„ 25th	31	44 0	39.2
„ 26th	34	36.2	31.2
„ 27th	26	32.6	25.8
„ 28th	21	33.2	26.7
„ 29th	19	23.8	19.0
„ 30th	31	23.7	17.3
December 1st	34	33.0	30.0
„ 2d	37	35.3	33.4
„ 3d	26	37.6	34.6
„ 4th	38	35.6	31.6
„ 5th	31	40.6	34.0
„ 6th	32	39.6	29.3

—*S. S.* [On examining the above table, we find that the temperature placed against the respective days of the month cannot be directly compared; for at Chiswick, on the 1st of December, for example, the *highest* temperature that occurred during that first day, and the *lowest* during the first night, are placed in the respective columns as the maximum and minimum temperature of December 1st, and so for all other days, in accordance with the practice of Howard, Daniell, and other meteorologists. But our correspondent, presuming that the coldest time of the *natural night of Dec. 1st* occurs towards morning, registers the indication of that cold against Dec. 2d; therefore the minimum of any particular day in the Chiswick tables must be compared with that of the following day in those of Holkham, as has been done in the annexed table. The minimum thermometer at Chiswick is placed about a foot above the surface of the lawn, and exposed to the open sky, and may be compared with that exposed at Holkham on Grass, but of course not with the other.

Difference between exposed thermometers at Chiswick and Holkham. The sign (+) prefixed denotes a higher temperature at Holkham than at Chiswick; and (—) a lower.

Nov. 8	+6.8	Nov. 22	—8.6
9	—8.0	23	—3.8
10	—3.2	24	—3.8
11	—7.6	25	+0.2
12	+4.2	26	—8.2
13	+5.6	27	+0.7
14	+6.5	28	—2.0
15	—0 8	29	—1.7
16	+5.0	30	—1.0
17	—5 0	Dec. 1	—0.6
18	—6.8	2	—2.4
19	—1.7	3	+5 6
20	—2.7	4	—4.0
21	—3.6	5	—1.2

On balancing these + and — differences, it appears from them that Chiswick averages for the period 1½° warmer than Holkham, which is very likely to be truly the case; and we conclude that both thermometers are correct. The most suspicious registration in the Chiswick column is that of the 9th Nov., where 50 appears as the lowest at night, whilst the highest during the day was only 53; but the observation proves quite correct, having been verified from a register kept by a gentleman in the vicinity, in which the entry, from the indications of first-rate thermometers, of the minimum temperature for that night, is exactly 50°. We have no doubt our correspondent will find many such discrepancies, which may be fairly ascribed to the variableness of climate.]

Greenwich Mean Temperature.—The difference of temperature between different places is a most interesting subject of inquiry; and not only I, but probably most of your readers, would feel pleased at seeing, in juxtaposition, tables indicating the mean monthly temperatures of Greenwich and Chiswick. The latter you have ready at hand; but, as you may not have the former, I subjoin them as extracted from "Belville on the Thermometer:" *G. S.*

Chiswick Mean Temperature from 1826 to 1849; and Greenwich Mean Temperature from 1815 to 1849.

Chiswick.	Degrees.	Greenwich.	Degrees.
January	36.60	January	36.46
February	39.56	February	38.80
March	42.81	March	42.04
April	47.53	April	46.78
May	54.22	May	53.74

The Year	49.83	The Year	49.39

[It appears from the above that the

Annual Mean Temperature of Chiswick is ... 49.83 degrees
Ditto ditto of Greenwich ... 49.39 „

Difference ... 0.44 „

or less than half a degree, probably owing to the difference of elevation.]

Vine Culture.—I find that Mr. Kidd has misquoted what I said about crimson-coloured Grapes; a little explanation, therefore, may be useful. Several years ago, some young Vines were procured from a nursery, under the name of Black Hamburgh; they were planted, and when they commenced bearing, the result was fine bunches and berries, which were well flavoured, but of a dull red colour. Black Hamburghs being what were wanted, on some of the red variety I grafted Hamburghs, which did invariably get black, and the result was that as long as the two sorts were allowed to grow on the same Vine, each kept their respective characteristics. I never, therefore, entertained the notion "that we may always expect at times ill-flavoured and badly-coloured fruit, with the best made borders, and under the very best management." Your correspondent remarks, that if he told his employer his Vine-house contained black Grapes, he should not like to send crimson ones to his table instead. I can believe that statement to be correct; it appears, however, from what he next unwittingly advances, that he does at times, under his present management or mismanagement, produce ill-flavoured and badly coloured fruit; for he says, "if any Grape will not come up to its flavour and colour by one means it must by another." He then informs your readers, "that of the whole Vines that he is acquainted with, hardly two kinds require the same treatment." He must therefore have a tolerably fair share of methods of managing Vines, and perhaps he will favour us with the peculiar treatment which each sort requires. I may add, however, that I find one sort of management to suit all my Vines, the only difference being that some sorts ripen earlier than others. Although Hamburghs will do with less heat than Muscats, it does not follow that Hamburghs cannot be properly ripened in a temperature that suits Muscats; but there is no doubt that the early and late sorts are best separate. *G. M., Wetherby, Yorkshire.*—The following thoughts, arranged in the shape of questions, have for some time baffled my mind and experience to answer satisfactorily. If your numerous and intelligent correspondents will give their experience in the matter, I anticipate that hints will be furnished that will prove interesting and useful to many. 1. Do Grapes improve in colour with the age of the Vine? 2. If so, why, or to what cause is this improvement attributable? 3. To what extent do you stop your Vines throughout the season? 4. Have you experienced any difference between stopping them closely

and allowing them to ramble? 5. Do you supply them abundantly with liquid manure at this, the ripening season, or keep them dry? 6. What difference do you make in the temperature as they approach ripeness? 7. Why should a bunch on a Vine which flowered only since the crop was ripe, become perfectly black in colour, with a good bloom, whereas the main crop was not so? *W. C. E.*

Societies.

Royal South London Floricultural.—At the last annual meeting, held (Dec. 11) at the Horns Tavern, Kennington, the chairman (M. Sangster, Esq.) read the following report from the committee.

"In presenting this our 15th report, we congratulate the subscribers on the steady progress and prosperity of the Society. In spite of a most unfavourable season, their shows, especially the Dahlia show in September, at which upwards of 10,000 persons were present, have fully equalled, if not exceeded, those of former years. The number of members who have paid their subscriptions during the past year amount to 209, of whom 42 have joined during the year. The Society has had five shows during the year, and the prizes given on these occasions amount to 292*l.* 15*s.*, in addition to 50*l.* 10*s.* given by members and others, making the total amount of prizes so awarded 342*l.* The auditors have made their report, of which the following is a copy.

Robert Seldon, Esq., as Treasurer, in Account with the Royal South London Floricultural Society

We, the undersigned, have duly examined the accounts, books, vouchers, &c., of the Society, from which we find that the balance due by the Society amounts to 23*l.* 15*s.* 4*d.*

(Signed) J. Davidson, Joseph Venables, W. Hodgson } Auditors.

Horns Tavern, Kennington, Dec. 10, 1850.

"We (the Committee) regret that we are unable to come before the subscribers with a clear balance sheet. In our endeavour to apply all available resources to the prizes of the Society (having in the past year given 24*l.* 5*s.* more than in the preceding), we have relied upon the subscriptions of certain members which have not been realised; but whilst we have thus striven to uphold the credit of the Society, we feel, and we say so in a kindly spirit, that we are not sufficiently supported by some of the classes, viz., the nurserymen and florists, who derive from it the greatest advantage. It is evident that while to the private amateur the Society is a source of amusement and pleasure, to the nurseryman especially it is of almost vital importance; and yet we observe, with regret, that sums of money, far exceeding their subscriptions to the Society, are annually given by nurserymen and others to support smaller societies, to be there frittered away in preliminary and other expenses, when the same amount brought into this Society, and applied as prizes would contribute much to the efficiency of the Society and more effectually promote the object of the subscribers. We desire now especially to impress this upon the nurserymen. The ensuing year will bring thousands of foreigners to England, and it is not to be doubted but among them will be many of the best florists from all parts of the continent. We hope, for the credit, not only of this Society, but of our country at large, that the shows of the year 1851 will be such as to excite the admiration of our foreign rivals; and to this end we intreat the nurserymen and others, instead of inviting competitors to isolated shows of an inferior character, to strengthen our hands, not only by the increased excellence of their specimens, but by concentrating their subscriptions for prizes, to create a degree of emulation among their brethren, which must redound to the credit and profit of the English nurserymen and gardeners."

The above report having been adopted, the Society then proceeded to elect officers for the ensuing year, when R. Seldon, Esq., was appointed Treasurer; T. C. Wildman, Esq., J. Davidson, Esq., and J. Venables, Esq., Auditors; and Mr. J. T. Neville, Secretary.

Reviews.

Episodes of Insect Life. By Acheta Domestica. Third Series. 8vo. pp. 434. London: Reeve and Benham.

At last this quaint and amusing piece of entomological gossip has been brought to a close, in a volume superior to its predecessors in illustration, style, and matter. As a book conducive to healthy inquiry, or as an inducement to more serious study, it deserves all that a friendly critic could be expected to say; but it will hardly meet with the approval of formalists, or of the rigid systematist, who value things only as they can be made to dovetail into some favourite classification. Not being written for the learned, it is scarcely within their province to examine it; but it must fall into the ranks of the best kind of "popular" natural history, that is to say, of elementary books, written in the hope of making science popular. The writer has no love for the incorporation of Greek and Latin with every day matters; but his book is in plain English, as it should be, for English folk. The fault of it is the fantastic way in which insects are grotesqued, till one can hardly recognise them; this, however, will, we doubt not, be a recommendation to many readers of all ages. The concluding words of the author may be well taken as a fresh specimen of his peculiar style and manner of thinking.

"If none, like the Spitalfield weaver, knows the delight of insect-collecting, none, like the city clerk, can tell the delight of insect observation caught by snatches upon summer holidays. Such, for many a year, was ours; and now, that our working-day of life is over, right pleasant have we found it to take our evening flight away for ever from its weary scenes, and to indulge without restraint in the manifold pleasures of our loved pursuit. Joyous to the bee and butterfly the exercise of their wings and senses amidst the sweets which fill the atmosphere they always live in; but yet more joyous to our prototype, the cricket, must be a flight like his, when he exchanges for summer air and sunshine the contracted pleasures of house and hearth; and of this description is our enjoyment now. And then—the correspondent boon—boon above a cricket's need or cricket's ken—our escape also from a moral atmosphere (hot, glaring, and heart-oppressive; sickly with the incense offered to Mammon by his servile worshippers) to an air, not alas! of heavenly purity, but in which the lungs of the spirit may breathe comparatively free. Oh! this is a privilege which calls loudly for our evening hymn of praise, and to bear our part in concert with that graduated band descending from angel even into insect choirs. And ill should we read that 'second Bible'—the Book of Nature, with all its actual displays and typical revealments, if we read not this—that He who, in every episode of insect life, is seen to conduct to good the humbler creatures of His care, cannot by us be doing less in all the dispensations, be they sorrowful or joyous, which form the episodes of our human, and, while here, most insect-like existence."

Another extract is still more illustrative.

"This proceeding of Mother Wasp reminds us of the trick of Maître Hibou, in La Fontaine's fable of 'Les Souris et le Chat-huant,' which, according to an appended note, is no fable at all, only a fabulized fact.* The story, familiar probably to many of our readers, runs briefly thus:—'An owl had made his palace in the hollow of an old Fir tree. The tree was felled, and in its cavity what should be discovered but a brood of mice as fat as butter, but without a single foot left amongst them. The bird of wisdom had discovered, it would seem, that little quadrupeds could manage to give the slip occasionally to winged bipeds, and had therefore employed his beak to annihilate the trotters of the furry brood. With a foresight reaching further still, even to the length of what we exclusively call human, he had there fattened them on pilfered grain, to keep them in good condition for future consumption at leisure and at pleasure.' Hereon, exclaims our poet, as well he may, admitting his fable to be fable but in name:

"'"Puis, qu'un Cartésien s'obstine
A traiter ce hibou de montre et de machine!
Quelle lui pouvoit donner
Le conseil de tromper un peuple mis en mue?
Si ce n'est pas là raisonner
La raison m'est chose inconnue.'"

"It is not so much to draw a parallel as to point out a difference between the owl, as mutilator of his mice, and the wasp, as disabler of her caterpillars, that we have quoted the above relation, assuming it, as affirmed, to be *plus vrai que vraisemblable*. The owl's measure of precaution was one which owls do not usually adopt; and if, as this would imply, resorted to on experience, it proved him most undoubtedly a *reasoning* owl. The wasp, in a proceeding somewhat similar, only does that which all wasps of the same species have done before and will do after her, and that on the very first occasion which calls for their maternal care in the furnishing of their nursery larders. In this, therefore, we can only look upon her as a wasp *instinct*-guided."

Let us add, in conclusion, that the present volume contains a good index to the whole work.

* "Ceci n'est point une fable; et la chose, quoique merveilleuse et presque incroyable, est véritablement arrivée."—*Author's Note.*

Miscellaneous.

Pruning Roses.—The following remarks on pruning will, I trust, prove instructive to the young Rose-grower. As regards the time for pruning, some recommend autumn or winter, while others advise its being done in the beginning of March. I, as well as most Rose-growers, like the latter season best. By winter-pruning the buds break in the latter part of the winter, and are almost sure to be cut off by late frosts in March. Pruning effects two objects: it makes compact handsome trees, free from weak shoots and dead wood, and it increases the amount of floral beauty throughout the summer and autumn. It is susceptible of three divisions: first long, second moderate, and third close pruning. Long pruning is employed for all strong, vigorous, free-growing kinds. The consequence of a vigorous-growing Rose being close pruned is, that it will make a quantity of strong shoots, generally springing from the crown close to the stock, and very likely no flower during the whole year; at all events, not until late in autumn. The proper plan is, to leave from five to eight strong shoots, placed as regularly as possible, to cut them back, so as to leave four or five buds of last year's wood, and then carefully to prune away all weak and dead branches. Roses do not flower well in the centre of the bush, and therefore that part should be well thinned out, leaving the branches as free of each other as possible. As a general rule, it is not right to cut into the bush below the preceding year's wood; but when the trees become old, it is necessary now and then to cut away a portion of the old wood, which becomes clubbed; and this applies more or less to all Rose-trees. It should be removed with a nice small saw, and the wound afterwards smoothed over with the pruning-knife. These remarks apply to most of the Hybrid Chinas and Hybrid Bourbons, also to some of the Hybrid Provence, Hybrid Perpetuals, and Bourbons. Moderate pruning consists in using the knife more freely than in the former case, in leaving but two eyes of last year's wood, and in carefully training the branches, so as to make the head round and compact. As Roses that require moderate pruning have a greater natural tendency to flower than those in the last-mentioned class, a little inattention is not so injurious to them. Under this head may be enumerated the greater part of our newest and best Roses, including the Moss, Gallica, Damask, Hybrid Damask Perpetual, and a great portion of the best Hybrid Perpetuals and Bourbons. The third method, or close-pruning system, is used for those Roses which are termed dwarf growers, or that make but little wood. This class is not numerous in comparison with the others, but it contains many of the brightest gems of the rosery. They succeed better on dwarf stocks than on those of four or five feet in height. In some cases they are shy growers, and apt to overflower their strength. This is obviated by close pruning, as the strongest shoots come from the crown; and as it is the interest of the grower to get wood in this class, the last year's shoots should be cut away pretty freely. Under this head may be classed a few of the best Moss Roses, and many Hybrid Perpetuals, Damask Perpetuals, and some of the Bourbon tribe. A few words on Yellow-brier Roses, and I have done. Roses of this class are peculiar in their flowering, and therefore require peculiar pruning. They are very early bloomers, and make no wood previous to flowering. They generally put forth the leaf and bud about the same time; it is therefore necessary that as much as possible of last year's wood be retained, particularly the ends of the branches, from whence most of the flowers proceed. The method that must be pursued in order to get as much flowering wood as possible, is not to prune them when other Roses are pruned, but shortly after they have done flowering, leaving three or four branches a little shortened. The rest must be cut well back, when they will make good flowering wood the remainder of the season, and ripen it well. *J. M'Ardell, in Beck's Florist and Garden Miscellany.*

Edgings for Walks may be exceedingly various; but there are a very few indeed that will give lasting satisfaction. Grass is almost the only one that can be altogether commended for pleasure-gardens; and it is one which, if carefully laid, and diligently kept, will be sure to please, for it has a good colour, smoothness, regularity, durableness when not under trees, and harmony with both the architectural and the vegetable constituents of a garden. It furnishes, likewise, the best ground-tint for setting off the colours of flowers, as in a flower-garden. As an edging, it should invariably be flat, and at an equal height (not more than half an inch) above the surface of the walk at its margin, with about an inch or even two in depth along the inner line, next the bed or border, to allow for the washing

down of the soil towards it. It must not be too narrow, or it will be difficult to keep cut, and the sides will be likely to crumble away. Box edgings are troublesome, liable to great irregularities, apt to harbour insects, and suitable merely for quaint figures and old-fashioned geometrical designs. They are the proper accompaniments of parterres and small flower-gardens that are laid out with numerous narrow gravel-walks; though near the house, in a truly architectural garden, neatly dressed stone edgings will be still better. Rougher stone, bricks, and tiles may make strong and durable edgings for kitchen-gardens. Thrift edgings, in connexion with cottages, are very pretty when perfect. They want replanting, however, every three years, and parts of them frequently perish, leaving the ugliest gaps, where they have been long grown in the same spot, though the plants should be ever so punctually divided and re-set. The dwarf Gentian (Gentiana acaulis), if planted in double rows, sometimes, in soil that suits it, makes a neat edging. Heaths, also, particularly the common Lyng (Calluna vulgaris) may, when promptly trimmed, produce an excellent edging for a Heath garden, or bed of American plants. The smaller Periwinkle, kept in due limits, is useful as an edging under trees; as is the common Ivy. Arctostaphylos uva-ursi will be appropriate in the same position as Heaths, and many varieties of rock and sun Rose, though a little too straggling, will supply a novel and consistent edging to a border in which masses of stone and rock plants are freely mingled. The most valuable requisites in an edging are evenness, diminutiveness or capability of being regularly trimmed, quietness of appearance or harmony with whatever is behind it, and permanence. In each of these respects, Grass will, in nearly all circumstances, have the advantage. Where it is least in character is immediately alongside of any rocky surface. There, the common Heath, undressed, would be most expressive and characteristic. *Kemp, on Small Gardens.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Of all things, watering requires most careful attention at this season. Adhere strictly to the simple directions we have so frequently given, never to water till the soil immediately below the surface is sufficiently dry to warrant a full supply. Have a sharp eye to detect on the first appearance anything like sourness in the surface of the soil, and let it be immediately examined and rectified; worms frequently render this necessary, and if the pots were not carefully drained in the first instance, the frequent waterings will have washed down particles of soil, which will have sealed up cavities so necessary to secure a free passage for the water. Stagnation is certain death to tender rooted plants at this season, and if water be altogether withheld, or if the dribbling system be tried, the result in most cases will be the same. Keep the houses as dry as the external atmosphere will admit of; not by the excessive use of fire-heat, but by avoiding as much as possible the creation of unnecessary moisture by spilling water, &c., and by admitting such a quantity of fresh air as shall, in connection with moderate firing, remove any superabundant moisture unavoidably created by watering, &c.

FORCING DEPARTMENT.

Peaches in pots that are in a condition for forcing, being well established in pots of a suitable size, which they were shifted into last season, with plenty of fresh turfy loam, and the wood being well ripened and well supplied with fruit buds, may be introduced into a mild temperature, and plunged into a bed of tan, leaves, or some other material which will supply them with a gentle bottom heat. Great care must be taken not to hasten too rapidly the swelling of the buds, as they will either drop off, or be so weakly when they expand, that not 1 in 10 will set. At the first commencement 45° will be high enough for the night temperature, and during the day a rise of 10° or 12°, if the weather be fine and clear; 60° of bottom heat will be sufficient to commence with, and after the buds show signs of growth, a very slight increase of top and bottom heat may take place. Vines in pots may, on their introduction, be treated in the same manner, giving gentle syringings twice or thrice a day, according to the state of the weather. The same treatment will apply to the starting of Figs, Cherries, and Apricots, for the first few weeks, but after that the Cherries will require to be kept much cooler than the other kinds of fruits. The advantage of growing these fruits in pots is, that an early supply can be obtained, and even a succession kept up in the early season, without starting an entire house of established trees at a period of the year which is unfavourable for their growth, and thus reserving the energies of these more valuable plants till a season more favourable for their development.

FLOWER GARDEN.

Advantage should be taken of frosty weather to do any rough work in the principal part of the pleasure-ground, such as pruning trees and shrubs, the doing of which involves a considerable mess, which can be more easily removed in such weather. A similar opportunity should be taken to wheel old exhausted soil from the flower-beds, and to replace it with fresh material, as this kind of work can be done in a frost in half the time that it would take if done when the ground and walks were soft, and with a tithe of the injury to both which would be inevitable in the latter case. When large evergreens move with good balls we have frequently taken advantage of such weather for the operation, and we never had a single failure in a shrub thus shifted. When the soil has been loose we have even prepared the trees in the afternoon previous, that by morning the balls might be frozen hard enough to hold together. We do not however recommend exposing the roots of smaller plants to frost, nor is there any necessity for it.

FLORISTS' FLOWERS.

At this time of the year, it often happens that severe frost follows heavy wet. When plants are overdone with moisture, they are more susceptible of frost than when moderately dry. It is therefore good policy for the amateur to guard against extremes of either one or the other. A double mat will be advisable over the Auricula frame at night, but should it be possible, even in severe weather, to give air, by all means let it be done; nevertheless, severe frost is not so ruinous at this season as many imagine; for we well recollect an extensive grower, in consequence of absence from home, leaving his frame open to a very heavy fall of rain, which was succeeded by as severe a frost; plants, soil, and everything else were completely frozen; but by covering up, excluding from the rays of the sun, and thawing them gradually, not the slightest injury was apparent. Tulip Beds will be more safe covered than exposed; and Ranunculus and Anemone beds had better be thrown up, in order to sweeten and insure the destruction of insects, &c. Should any one have Carnation layers unrooted at this season, they must be examined after a frost, and again pegged down. The directions given last week for the other departments will hold good during the few next coming weeks.

KITCHEN GARDEN.

Before the general manuring and trenching of vacant ground, it is necessary to decide on the rotation of crops which are to be cultivated upon it during the ensuing summer, that these operations may be ordered with special reference thereto. This arrangement should be made, not for one year only, but for a series or cycle of years. One of the first principles to be attended to is, that no annual crop be grown for two successive years in the same plot of ground. Another variation should be made by taking care that those crops which immediately succeed each other are not such as are liable to be preyed upon by the same kind of insects; as their increase is encouraged to a fearful extent by thus putting into their way the species of food which they are most fond of. It is important that both the manuring and the depth of the trenching be regulated by the requirements of the crops; and their rotation should be so arranged that the ground be not trenched to the same depth for two successive seasons, but so that different portions of the soil be brought to the surface in turns. The perennial or permanent crops will, of course, form a class by themselves, as they do not require a change of situation for many years; but when this is necessary with any portion of them, the ground from which they are removed will fall into the ordinary rotation in the way of a regular exchange. But we will take a future opportunity of recurring to this part of the subject, and confine ourselves for the present to the annual crops. By cultivating the Celery and Cardoon on the Scotch or wide bed system, a large ridge of soil is thrown up between the trenches, the surface of which is excellently adapted for the cultivation of dwarf Peas, Beans, Spinach, Turnips, and similar vegetables; observing, however, that only the earlier sowings of these several crops should be made on these ridges, that they may be removed in due course, before the ground is required for earthing up the principal crop. As a matter of course this arrangement must not interfere with the very earliest crops of Peas, &c., which are generally allowed a place on the side borders near the walls. For the latest crops of Peas, &c., a portion of ground must be allotted, which, with that occupied by the Celery and Cardoon ridges, will generally amount to about one-third of the ground occupied by annual vegetables. The extenive turning over which the Celery and Cardoon soil undergoes, acts admirably in preparing the ground for deep rooting plants, such as Turnips, Carrots, Onions, &c., and in the following year may be devoted to the cultivation of the Cabbage family, whose roots are confined more nearly to the surface. If the vegetable garden is so large as to allow of the cultivation of a portion of the general Potato crop within the walls, it will form a fourth course in the rotation, and will come in after the Brassica tribe. Working upon this system, Cabbages have been planted during the autumn on ground which had been occupied by late summer Turnips; and the ground which now requires trenching is that from which the later Turnips, Onions, Carrots, Beet, &c., have been removed, and which will next spring be planted with Cauliflower, Broccoli, &c. Preparation for these should be made by trenching in a very heavy dressing of manure, which shall serve for that and the succeeding crop; as the last few years have fully convinced us of the impropriety of planting Potatoes on ground recently manured.

State of the Weather near London, for the week ending Dec. 19, 1850, as observed at the Horticultural Garden, Chiswick.

Dec. 13—Very dense fog; cloudy and fine.
— 14—Clear; densely clouded; clear; boisterous with rain in the evening; squally at night.
— 15—Overcast; rain; warmer at night than at noon.
— 16—Clear; very fine in forenoon; overcast; boisterous with showers.
— 17—Clear; rain; slightly clouded; slight frost.
— 18—Frosty; fine with sun; rain.
— 19—Foggy; fine with sun at noon; overcast, rain; clear and frosty at night.
Mean temperature of the week 1 deg. below the average.

State of the Weather at Chiswick during the last 24 years, for the ensuing week, ending Dec. 28, 1850.

Dec.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 22	45.3	34.3	39.8	12	0.38 in.	2	4	2	1	2	6	5	2
Mon. 23	44.3	32.6	38.4	12	0.25	4	6	1	1	1	7	1	3
Tues 24	42.9	31.8	37.3	9	0.36	3	3	2	1	1	8	1	4
Wed. 25	42.6	29.0	35.8	5	0.22	2	4	3	—	2	5	4	3
Thurs. 26	42.3	32.0	37.1	9	0.39	1	4	2	3	4	7	—	3
Friday 27	42.2	30.3	36.3	8	0.40	3	4	1	—	5	3	6	2
Satur. 28	41.0	29.8	35.4	8	0.16	3	3	2	3	2	1	6	4

The highest temperature during the above period occurred on the 25th, 1827—therm. 58 deg: and the lowest on the 24th, 1830—therm. 10 deg.
On the average of 24 years, the night of the 25th of December is colder than any other night throughout the year.

Notices to Correspondents.

Anemones: *J Walton.* Such flowers are common. They are merely such as from some unknown cause expand prematurely, before their colouring matter has had time to form.—*A S W.* Plant in spring, in nice light soil, moderately enriched with leaf-mould or other well decomposed manure. For directions on general management, you cannot do better than consult Tyso's little "Treatise on the Anemone.‡"

Camellias: *H H.* Dropping of the buds occurs through many causes; but in your case it may be occasioned by over heating. 58° during the day, and 50° at night, are too much for Camellias; 40° are ample.‡

Clubbing: *Cavanensis.* It is caused by an insect, and may be prevented by putting wood-ashes in the holes along with the plants at transplanting time.‡

Grafting: *Devonian.* Rhododendrons may be grafted early in spring, keeping the plants in the bark bed of a warm greenhouse. Tacsonia manicata will possibly succeed on Passiflora Buonapartea.‡

Heating: *A C B.* If you wish to have trees in front you must have pipes in the middle of the house; but the front is their proper place. Take care that in sinking them you do not let your heat be absorbed by the surrounding soil. Use 4-inch pipes.

Insects: *S W B.* Put some soft bits of wood and sawdust into the flower-pot with the mould, as wood is the ordinary food of the caterpi lar of the goat moth, and it forms its cocoon with the sawdust. *W.—Reader.* The most effectual way of clearing your Pear-trees of scale, is to wash them with water at the temperature of from 150° to 160°.‡—*A. B. C.* Next week.

Moss on Lawns: *S R F.* If your lawn is devoured by Moss and Daisies, you will be right in giving it a dressing of ammoniacal lime from the gas works, and in spring a dressing of soil. It will be worth your while to fetch ammoniacal liquor some three miles, as you can have it for nothing, to mix with leaves, burnt earth, &c.? The Moss will disappear; and perhaps Daisies also, if the Grass becomes strong enough to smother them.

Names of Fruits: *J R.* 1, King of the Pippins; 2, Paradise Pippin; 3, Sweeney Nonpareil; 4, Easter Pippin, or French Crab; 5, Downton; 6, Norfolk Beaufin; 7, Dumelow's Seedling.‖

Names of Plants: *A H.* Your plant appears to be the "Daphne Mezereum foliis atropurpureis" of continental gardens. Its history is unknown. It is not a Mezereum. Mr. Van Houtte, who figured it, suggests that it may be Wallich's D. papyracea, a plant with which we are unacquainted. To us it looks like a mule between D. Laureola and D. Mezereum.—*Reader.* Adiantum æthiopicum. *S.—Erzeroum.* 638, Delphinium Oliverianum.—*P P Celle.* It is not possible to determine the Oncidium, the flower having been smashed by the letter-stampers; it is near O. suave and Suttoni. The Epidendrum is a very curious species from Xalapa, called antenniferum. The Cœlygyne is C. trisaccata of Griffith, a species we did not before know to be alive in Europe.

Netting: *S R F.* Dip bird netting in a tan pit. Stockholm tar, quite hot, will also do. Caoutchouc, dissolved in naphtha, is much too expensive.

Peach trees: *Gardener.* There can be no doubt that they will be injured by Laurels which grow within 6 feet of them, and which are higher than the Peach trees, keeping the border in which the latter grow in perpetual shade.‡

Planting: *Arborisauctor.* Will Cryptomeria thrive in N.W.? For upright growing plants take Cupressus torulosa or Goveniana; the latter being the smaller may go nearest the house. Add *there* Abies Pinsapo, a charming tree; and Douglasii for the larger spaces. If variety is an object, Juniperus flaccida might mix or contrast with Cupressus torulosa. Abies Webbiana might very well contrast with Douglasii.

Portable Greenhouses: *Reader.* We do not know.‡

Rafflesia: *Ajax.* The flowers are cinnamon-coloured, speckled with yellow, when expanded. It is a parasite, and not cultivable. There are many tastes to consult, and editors must attend to them. We are always much obliged to the correspondents who favour us with communications of horticultural *interest.*

Rockwork: *A Reader.* Nothing thrives under the shade of trees so much as elsewhere. You may try Periwinkle, Wood-sorrel, Ivy-leaved Toad-flax, Arabis grandiflora, spring bulbs, and Ferns.

Rhododendrons: *E A C.* If ladies will take the same care of these as of their lap-dogs, they may be grown even in London. What Rhododendrons want is to be kept clean by frequent washing, and to be *well* supplied with water. Periploca græca does not emit any poisonous odour; very few plants do; but some do, such as the species of Rhus or Sumac.

Russian Superb Violets: *R Shackell.* We have received these safely; and very sweet and very fine they are; certainly an improvement upon the Russian.

Taxidermy: *W J.* We will inquire.

Verbena Seed: *A M.* Sow it in spring in nice light soil. Verbena plants may be bedded out as soon as all danger of frost is over; say about the middle of May. The roots *may* be kept alive over winter; but the best plan is to take cuttings and strike them in autumn.‡

Victoria Park: *P F W.* We do not know; but it is so said.

Vines: *A Constant Reader.* Oldaker's St. Peter's is the best black Grape, and the White Muscat of Alexandria the highest flavoured white one for a late supply; these, with the Black Morocco and Calabrian Raisin, will answer your purpose.‖—*R A C B, Chesterfield.* As you intend to plant Nectarines and Peaches inside your Vinery, it will be advisable to plant your Vines outside, and protect their roots as you propose. Instead of stones lay drain-pipes across your border at every 4 feet, sloping of course to a main drain. If you make a good border 12 or 15 feet wide, that will be sufficient for the roots; you may let them extend beyond this if they will.‖—*Harold.* For your proposed selection for a greenhouse, substitute the Royal Muscadine, Black Frontignan, and Black Prince, for the White Muscat of Alexandria, Purple Constantia, and West's St. Peter's.‖

Water Filters: *Clerious.* Possibly the plan described at page 549 of the present year's volume may answer your purpose.‡

Just ready, price 10s., with Maps and Woodcuts,

THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, Volume XI., Part 2 (No. XXVI.)

CONTENTS:

MR. PUSEY, M.P.—On the progress of Agricultural Knowledge during the last Eight Years.

The Journal will be forwarded as usual, postage-free, to all Members of the Society not in arrear of subscription.

London, Dec. 18, 1850. JAMES HUDSON, Sec.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The Council of the Royal Agricultural College, at Cirencester, propose, after the ensuing Christmas Vacation, to receive within the walls of the College Students who, at the date of their admission, do not exceed 16 years of age, though they will not necessarily be removed on reaching that age.

Students between the ages of 16 and 20 may be received in a commodious Boarding House, in Cirencester, under the superintendence of a resident Professor or Master. Out-Students above the age of 20 will be admitted on the same footing as heretofore.

TERMS, PER ANNUM,
TO BE PAID HALF-YEARLY, IN ADVANCE.

Pupils under fourteen years of age	45	Guineas.
Ditto above fourteen	55	,,
For a separate sleeping apartment, if it be required, an additional	10	,,
For a share in a private study, of which there are but a limited number	5	,,
Pupils in the Boarding House	80	,,
Out-Students	£40	

Excepting in the case of Out-Students, these terms will include everything but medical attendance, books, and writing materials.

The Religious instruction and moral discipline of the whole of the Students will be most carefully attended to, as the groundwork of all education.

The Lectures in Chemistry—the Veterinary Art—Geology—Botany and Zoology, hitherto so ably presided over and conducted, will be continued, for the especial benefit of the elder Students.

Instruction—by competent Masters—in Arithmetic, Algebra, Mathematics, and Natural Philosophy, Surveying and Mensuration, in History and Geography—will be offered to every Student; while those, whose Parents desire it, will be instructed in Modern Languages and Classics.

Agriculture will be taught on the Farm—where the Students will be led to compare what they have learnt in the Lecture Room with the practical system of cultivation which they will see carried out.

They will also have the opportunity of becoming thoroughly acquainted with the breeding, rearing, feeding, and general management of all kinds of Stock—with the preparation of Corn for the market—and with the application of Steam Machinery to Farming purposes—and also with the best system of Farm Accounts.

It will be seen from the above that the Royal Agricultural College offers decided advantages to those who wish to qualify their Sons, either for the pursuit of Agriculture as a profession, or for becoming Land Agents or Stewards; also to persons of any age, who, intending to emigrate, desire to obtain some knowledge of Agriculture before leaving England; moreover, no slight inducements are held out to all parents, who are desirous of procuring for their Sons such an Education as will qualify them for any calling or profession, at as moderate a cost as is compatible with the advantages offered, and with the liberal scale on which the comfort of Students will be attended to and promoted in every particular.

For further information, &c., application may be made to the Principal, The Rev. JOHN SAYER HAIGARTH,
Dec. 21. Rodmarton, Cirencester.

The Agricultural Gazette.

SATURDAY, DECEMBER 21, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Dec. 26—Agricultural Imp. Society of Ireland.
THURSDAY, Jan. 2—Agricultural Imp. Society of Ireland.

THE insufficient education provided by the great proportion of the farmers in this kingdom for their sons intended for their own occupation, has been a subject of common observation. It is a remarkable feature in our agricultural policy. We may add, that under the great changes now in progress, this is a real misfortune, and will place the youth destined to follow this occupation under grievous disadvantages. In time to come, agriculture will rank amongst the sciences, and must seek the aid of many of them, if it is to be cultivated successfully; and a more or less intimate acquaintance with sciences essentially connected with it, chemistry, geology, mechanics, and vegetable physiology, will be indispensable. We are nevertheless informed, on authority on which we can rely, that there are farmers at this moment availing themselves of the village schools, provided for the gratuitous education of the children of the poor, for the teaching of their children.

It was under the conviction that suitable instruction for farmers' sons was *the* great want of the age, that we rejoiced at the efforts made some few years ago to found an agricultural College, and the promise of success afforded by the fine institution erected near Cirencester. We hoped and believed there never would have been an empty bed in it, but we have regretted to hear from time to time that the number of pupils was insufficient to clear the expenses. From inquiries we have made, we believe the main cause of difficulty has arisen from the founders having overlooked the point with which we commenced our remarks; and that, with some exceptions, the lads sent there had been by no means previously educated up to the mark, and were therefore not in a position to avail themselves of the advantages provided for them. We are fortified in this opinion by knowing that some of the better qualified, who therefore were capable of appreciating these advantages, have since filled responsible situations with credit to themselves, and some of them have contributed usefully to our agricultural literature.

The Council of the College, after much consideration, have, we understand, come to the resolution to remodel the College, to meet the practical difficulty to which we have adverted; and we think they have judiciously determined to provide, on the foundation, a school for younger boys under 16 years of age, in which a good general education will be given, in connexion with agricultural training, which will gradually enable the pupils to understand and appreciate the lectures and demonstrations of the scientific professors. While the education given will be mainly directed to the pursuit of agriculture, we are informed it will be such as will qualify lads for any useful pursuit in which circumstances may place them, whether as bailiffs, land-agents, or emigrants, or in any commercial occupation.

The College system of education will be preserved for older students resident out of the College in an establishment under the superintendence of one of the Professors.

Another alteration in the administration of this Institution has been determined on, which we also consider judicious; which is, that the attention of the Principal will be devoted exclusively to the teaching and superintendence of the school and College, and that the farm will be placed under the management of a practical farmer fully sensible of the advantages yet to be derived from the alliance of science with practice, who will avail himself of all well established improvements in the conduct of the farm. Up to the present time the Principal has not only had the entire superintendence of the students, an ample occupation in itself, but also of the farm, containing about 700 acres, which in these times would well engage another mind.

We learn that upwards of 30,000*l.* have been expended in providing every requisite for the successful advance of this highly useful and important Institution, in which we see by the prospectus a boy under 14 years of age may be boarded and educated, in the most efficient manner, at the moderate cost of 45 guineas per annum. We earnestly hope that fathers will avail themselves of these advantages, and we would anxiously impress upon the sons the many difficulties which at present beset their path, and the absolute necessity of their assiduously and zealously availing themselves of the various sources of knowledge provided by this Institution.

THE MIDLAND COUNTIES EXHIBITION OF POULTRY, which hitherto had been an occupant of temporary resting places, has at length, on its third anniversary, been fixed in a permanent building worthy of the grand object for which it has, with astonishing rapidity, been erected. In one portion of this noble room, such a collection of fowls has just been exhibited as never were congregated before; and if the rate of advancement of the Show, during the short interval from its first establishment, may be considered as any guide to estimate its future progress, we are rather startled in attempting to anticipate what these assemblages of men, beasts, and birds may come to hereafter.

The new Bingley Exhibition Hall has two handsome façades, duplicates of each other, at either end, of a good solid utilitarian character, yet far from inelegant. The building covers a superficial area of about *an acre and a quarter*, all inclosed and roofed in with solid materials. With the exception of a small portion set aside as offices and other conveniences, the whole of this can be used as one vast room. It is capable, however, of being divided into five compartments, the largest being in the centre. All of these may be used for a separate purpose at one time, if required; and on the late occasion, the compartment to the extreme left on entering was devoted to the poultry, the others being allotted to the cattle, sheep, and pigs. The roofs which cover these five contiguous compartments are supported by cast-iron columns, which also serve another useful purpose, by conveying the rain-water from the gutters down to the drains beneath. The building is all but entirely lighted from above by parallelograms in the roof of sheet-glass reaching from end to end. Outside, one expects to find the interior dark; but it is by no means so; and the privacy of the place is much increased by this arrangement, to the disappointment of all impertinent PAUL PRYS, and unauthorised PEEPING TOMS. Little boys cannot here lift up the canvas, and get a sight of the show gratis. We may suggest that it would have been a great improvement in an edifice of so permanent and public a character, had the portico for exit and entrance been brought only a few feet further over the roadway, so as to allow a carriage to drive *under* it, and set down company under shelter, instead of being obliged to draw up outside in all weathers. Some special accommodation might be made for visitors coming on foot.

The number of birds here displayed *for competition* last week, was 2000, half-a-dozen head more or less, in 556 pens; besides which there were a good number of dealer's pens, making altogether nearly 600. The amount given away in prizes was about 70*l.*, and the nearest possible calculation that can as yet be made of *bonâ fide* sales of poultry, amounts to nearly 400*l.*; besides which, a great number of sales were made by private contract, and not registered in the office; doubtless, to save the 5 per cent. charged by the Society on all registered sales. The total number of visitors during the four days that the Exhibition was open, amounts to 30,000! And it is not too much to say, that the poultry department was, throughout, the most attractive, and most densely crowded portion of the show.

As to the quality of the specimens, it is difficult to speak too highly. In every class there were creditable samples; in some supremely beautiful and good. Not that there were not here and there a few lots that might as well have been kept back at home. In such a multitude, all cannot be first-rate; the wonder was that there were so few low-caste bipeds. But even these had their lesson assigned them to teach. In early youth we remember to have copied and re-copied the maxim, "By others' faults, wise men correct their own," and the few shabby specimens of poultry in the Bingley Hall, hinted to the fancier where to weed and how to breed his stock. One lot of chickens (214) appeared to us instructive in this way. We are informed that the Judges, on first catching sight of these little creatures, burst into a simultaneous fit of laughter: on recovering the gravity proper to their position, they discovered that these birds were "Hatched by exhibitor out of CANTELO's Patent Incubator, August 12, 1850." Our resolve is confirmed to stick to the hens in future, unless we either take up our residence in Egypt, or can import the Egyptian sun and climate into Great Britain.

Exactly as last year, so now, the same practical utilitarian spirit pervaded the exhibition. Cocks and hens, turkeys, ducks, and geese were the prime favourites, although several real zoological curiosities were present. There were three veritable hybrids between the pheasant and the common fowl; a couple shown by Lord GUERNSEY, and a single bird, a remarkably fine specimen, between the pheasant and the Spanish fowl, by Mr. BUCKNILL, of Exminster. There was also a jungle fowl of somewhat more than half wild blood; but they attracted no great notice. Very healthy and well-plumaged gold and silver pheasants were regarded with much the same indifference; in spite of which, we hope never to see such things entirely absent from the show. The rumkins were sadly, and we think undeservedly despised. There were, besides, a pair of very beautiful white Persian doves, which would be liable to be called albinos from the common collared turtle, did not the absence of all trace of the ring round the neck lead one to suspect that they might be specifically distinct. A pair of ring-doves or wood-pigeons, reared from the nest, were so handsome, healthy, and well-behaved, as to do great credit to their exhibitor, Mr. EDWARD HEWITT, of Sparkbrook; we only quarrel with that gentleman because in the catalogue he calls them the "usual wild breed *domesticated*." As well might Mr. WOMBWELL have called any of the lions and tigers reared in his menagerie the "usual wild breed domesticated." If either bird or beast were suffered to go at large on reaching the third or fourth anniversary of its birthday, the one would prove as domestic as the other would innocent. We should not thus cavil at terms, did they not convey very erroneous ideas.

The prices actually realised confirm, in the surest way, the higher estimation in which useful birds are held above those which are merely ornamental, and which have no better claim on our favour than that of being luxurious appendages to the pleasure-ground. We do not state this from what appears in the catalogue; many of the prices there set down are intended by the exhibitors to be *prohibitory*, and to prevent the possibility of the specimens passing out of their possession. This we may suppose to be the case with No. 407, pair of English carriers, 20*l.*; 409, Antwerp carriers, 15*l.* 15*s.*; 43, Cochin-China cock and three hens, 50*l.*; 55, cock and three hens of the Worcestershire pile game, 20*l.*; and 534, three white guinea-fowl (anything but rare), 5*l.* But, in several instances, the prohibitory price put

on was insufficient to secure the return of the birds to their owner; and the committee have very properly laid down the rule, that, *if* the price marked against each lot *is* offered, the transfer must imperatively take place. We may mention the couple of birds that occupied the pen 184, instead of the half dozen chickens that ought to have appeared there; they were large white birds of the Cochin China family, and marked 5*l.* 5*s.* They were sold at an early period of the show, and the buyer was soon offered 7*l.* 7*s.* for them, which he refused. The exhibitor had not intended to sell them at all, and so had to submit to the inevitable misfortune of parting with a cock and hen for the small sum of five guineas. The remembrance that he had more at home, aided, we believe, in affording a little consolation. Lord Hill's Dorking cock and three hens (No. 13), gaining the first prize, and an extra medal, were marked at 2*l.* 2*s.*, and were very soon bought up; had the price been treble that sum, they would have been sold. No. 132, Mrs. Hasier Williams's black Polish cock and three hens, also gaining a first prize, and an extra medal; and, in our opinion, decidedly the cream of the exhibition, although marked at 4*l.*, were quickly snapped up; had their price been half as much again, or twice as much, they would still have been secured by some admiring amateur. The poultry sold on this occasion amounts to several hundred pounds. An extract from the catalogue will best show the reader in what a serious business-like way the value of each specimen is estimated.

"197. Exhibitor: Thomas Henry Travis, Esq., York. (Six Cochin China chickens.) Yellow cockerel, hatched April 11th, price 10*l.* 10*s.*; dark cockerel, hatched April 11th, price 10*l.* 10*s.*; brown pullet, with clean legs, hatched April 9th, price 1*l.* 5*s.*; speckled pullet, with clean legs, hatched April 16th, price 1*l.* 5*s.*; brown and red feather-legged pullet, hatched April 27th, price 1*l.* 10*s.*; yellow feather-legged pullet, hatched May 11th, price 1*l.* 5*s.* Total 26*l.* 5*s.*"!!

In contrast to this, some beautiful gold and silver pheasants (542 and 543) were offered at the reasonable price of 2*l.* each the pair. A gentleman, on being invited to secure a choice fowl or two, was overheard to exclaim, "No! No! it's the price of a pig!" In short, symptoms are apparent that a national cock-and-hen mania is coming on. It will not prove so dangerous a disease as the railway fever.

Guinea-fowl never seem at home in a Poultry Show; they turn out either sulky or shy. Lady Charlotte Gough's prize pair (531) were handsome, normally-coloured specimens. The pied birds are, to our eye, the ugliest of the ugly, and the white ones not much better—at least, in an exhibition. The geese were glorious. Lord Howe's white gander and two geese (454) taking the *second* prize, would be pre-eminent almost anywhere; but yet they were surpassed by the portly presence of the grey birds, in No. 465. The Catalogue tells us that they were sent by "Mr. Thomas T. Parker, Sutton Grange, near St. Helen's, Lancashire, and were bred this year, 1850. (Breed unknown). Price 5*l.* 5*s.*" They were Toulouse geese, of due colossal amplitude and magnitude. Of the livers of these birds are made the famous Perigord pies, so pleasant to those who can digest, after eating them. The ducks, too, were admirable; the Aylesbury all very good, from various exhibitors, who might well be jealous of each other. Some specially beautiful half-bred wild ducks were sent by Lord Howe. Some pretty top-knotted ducks (509) attracted great notice, and they seem to be appreciated by their owner, who has secured them to himself by the golden fetters of 52*l.* 10*s.* We do not call them *tufted* ducks, as does the catalogue, because that title is appropriated by a wild species. Good Muscovy and Buenos Ayres birds were also present. A better collection of turkeys in their varieties can hardly be brought together. Lord Hill's Americans (519), were super-eminent, and were young birds; but all the others were extremely good. The stags are the most showy birds on these occasions, but they are apt to be ferocious. Lord Hatherton's copper-coloured cock killed one of the hens penned with him before the public were admitted to view.

The bantams were superior to what they were last year, but still *they* by no means reached the *beau ideal* which our own imagination pictures. There were no black bantams for competition, though they are about the purest of their family. One white bantam cock (395) by his air and carriage gave dignity to the whole group. The Nankin bantams just indicated, to those who can see, the native beauty possessed by this tribe of fowls. The silver-laced Sebrights were all much too yellow; and, among the gold-laced, several hens were suspected to be chickens—an error which, however pleasant on a supper table, is not fair in a poultry show. We should much like to see a few good lots of the true old-fashioned, speckled, feather-legged bantams another year. They are really of very ancient pedigree and high caste, which the Sebrights, we are assured, are not. But the middle classes are not in great possession of them just now. They are to be found either in a few aristocratic, perhaps royal, families, or amongst a few artizans who are as nice about the creatures they keep as the Arab is touching the pedigree of his mare. Are not such fanciers as these last, better and more happily employed than they would be in devising new threadbare schemes for the regeneration of society?

The class of six chickens of various breeds was both as numerously and as respectably attended as it was last year. But under this head, we must protest against the introduction of six cockerels into one pen another season. What should any amateur, farmer, hen-wife, or dealer, do with six cockerels of any breed, however choice, except condemn them to the fatting-coop. It would be of no use stocking colonies with consignments such as those. Capons would do as well, or better. Perhaps the committee will think fit to limit the proportion of the sexes in this class, and prevent the cocks from swamping the hens altogether. No. 231, chitteprats, from Keighley, was in much better taste in its association of five hens to one cock.

Messrs. Baker, of Chelsea, sent some specimens for sale; amongst others a very nice pair of young shieldrakes, which were enviable by whoever has a pond in his pleasure-ground.—Mr. Baily, of Mount-street, Grosvenor-square, *openly* displayed model Spanish, Dorking, Cochin China, and other fowls for sale, besides the above-mentioned jungle-fowl, and the neatest little white call-ducks we ever saw. We say *openly*, because what secret resources Mr. Baily may have, nobody but himself can tell. We suspect, that like Robert Houdin, or Mr. Jacobs, the conjuror, he can produce *any* known fowl from one of his magic hampers. He has been of great assistance to the Exhibition in its infant state; and we are assured that the Association, in its maturity, gratefully appreciates his services.

Besides the poultry medal figured above, a large extra medal has been liberally provided by the Committee, as an additional prize this season. It represents a group of a cock and three hens of the silver Hamburgh fowls. The design is by Mr. James Bissell, the die by Mr. Thomas Ottley, a happy combination of talent which ensures both accurate portraiture and finished workmanship. The medal, we foresee, will be as much admired as it deserves. It is in contemplation by the Committee every year to give a fresh extra medal, representing a group of some *one* breed of poultry. The idea is a happy one; for at the end of the series, whoever is possessed of it entire, will have a complete set of imperishable illustrations of this very interesting branch of natural history, which will be of inestimable value long after *our* frames have crumbled into dust. Such a series, struck during the Augustan age, could it be discovered amongst the hidden treasures of ancient Rome, would now be priceless, were it only as faithful in its delineations as are the metallic portraits of which the first now makes its appearance.

Our limited space is filled, and we must conclude; but not without offering our congratulations and thanks to Mr. J. B. Wright and his able coadjutors. Any compliments we might wish to pay them may be summed up in one short sentence. *They have opened an amusing and instructive spectacle to* thirty thousand spectators.

ECONOMY OF FOOD.

Two papers of considerable importance, on this subject, appear to have much escaped the attention of agricultural periodicals; although the subject itself is of vital interest to the depressed and oppressed agriculture of the country.

Whilst the corn grower is unable to compete with the foreigner, we need some articles of culture for food, less liable to competition, and not less nutritive and palatable. The green crops, which well suit our climate, produce more nourishment per acre, and are protected by the greater proportionate cost of freight, and perishableness on shipboard, suffer under other difficulties. The precious Potato (however despised) is still subject to the putrid disease; the Turnip is too juicy and soft for human food, alone; and in that objection all the other largely grown edible roots and greens more or less participate. And the conversion of these into beef and mutton, taking an average of 150 lbs. to make 1 lb. of flesh, is a waste, regarding both as human food, which must limit its practice in a densely peopled country.

The papers in question do not directly meet this dilemma, but they appear to establish two principles, which expand the restriction of our choice of agricultural plants, and of the modes of their preparation for food, by considerations at present overlooked or disallowed.

1. The first relates to the incorrectness of nitrogen as a measure of nutritive power in different articles of food.

2. The second to the increase of nourishing power of the same food, by presenting it to the digestive organs in different conditions.

The first of these papers was read at the British Association, entitled "On the per-centage of nitrogen as an index to the nutritive value of food," by Dr. A. Voelker. This goes to show the inaccuracy of the rule, inferred from Liebig's analogy between the vegetable and animal protein compounds, that "the nutritive (or rather the fleshening and strengthening) property of food is proportionate to the nitrogen it contains." So generally has this rule been received, that in several of the recent tables of the comparative value of food, the proportion of nitrogen has been taken as the basis, or even as a correction of actual experiments, in feeding; and the cultivation of different plants has been recommended according to their relative contents of this ingredient. But Dr. Voelker shows, that in many cases much of this nitrogen is not in the composition of protein (the fleshening principle); and contributes little or nothing to the formation of flesh. The discussion which followed also went to infer that there was yet much to be learned respecting the assimilation of nitrogen, and the relation of food to the formation of the blood (and consequently to nutrition). Under these circumstances, agricultural improvers will, for the present, not be restricted by the proportion of nitrogen, as a guide to practical feeding; but will put more trust in their established tables, esteeming Leibig's above quoted analogy, for occasional reference and reasoning, whilst the further progress of chemical (as well as practical) investigations are rendering it a surer guide to their broad acres: and productive plants, at present rejected for deficiency in nitrogen, may be found valuable in mixture, or even alone.

The most comprehensive table of reference, for this purpose, that I have met with, is given by the Rev. M. J. Berkeley, in the *Agricultural Gazette (Gardeners' Chronicle)*, 1845, p. 649; where the theoretical nutritive power, computed by Boussaingault from the nitrogen of no less than 76 plants, and parts of plants, cultivated for food, &c., is given; in contrast with 16 other tables, drawn from practice and experiment: the republication of that table, with an additional column for that compiled by the Rev. W. Rham, would be very appropriate to the suggestions from this paper of Dr. Voelker.

The other paper goes a step farther; it is entitled "Alimentary Regimen," by M. Gasparin, read before the French Academy of Science, and unnoticed in any other English publication that I have met with, than "Chambers's Edinburgh Journal." It relates chiefly to the diet of working-people: and establishes a remarkable difference in the strengthening power of the same material (bread) according to the mode in which it is presented to the digestive organs.

He finds that the mining population about Charleroi (on the border of Belgium) nourish themselves fully, preserve health and great vigour of muscular strength, upon a diet with less than half the nutritive principles found requisite for hard-working men in the rest of Europe. The distinction appears to be the habitual use of coffee at every meal. Their coffee is a very weak infusion of equal parts, coffee and chicory, with about one-tenth milk. Of this the miner takes about four pints daily; and little or no other drink. His food is white bread and butter, with a supper of Potatoes and greens. He eats 2 lbs. of bread, 2oz. of butter, and 1½lb. mixed Potatoes and greens daily; and uses 1 oz. each of the coffee and chicory. No meat except Sundays and feast days; when he also drinks four pints of beer. This is less in nutritive quality than the diet of the monks of La Trappe, or of the prisoners in the French jails: and yet these Belgian miners are energetic workmen; so that the French miners, with a more nutritious diet, are unable to compete with them. This efficacy of the coffee is not attributable to the nourishment contained in itself, which is very small; but indirectly to its co-operation with the other food; or to its action on the vital organs of digestion and secretion.

M. Gasparin also instances the efficacy of coffee in enabling soldiers and others to endure fatigue; and adds that the miner, with his wife and six children, lives on 1*s.* 7*d.* a day, without getting in debt.

Coffee, then, though very little nourishing in itself, seems to deserve more attention than it receives, as an article of diet and economy, for its influence on other articles of nourishment. Coffee we cannot grow in this climate, though we get it abundantly from our colonies; but the other ingredient, chicory (or succory), grows wild in this country, is of easy cultivation, a heavy bearer, stands the frost; the leaves are an excellent and early fodder, and no contemptible dish for the table; and the root not only mixes well with coffee, but when roasted forms a very respectable substitute for it. After long keeping, roasted and ground, it gets flat; but the root may be kept dry, and baked weekly in a pretty quick farm or cottage oven, brown all through like coffee, not black. For this it is best cut up, not larger than hazel nuts; and it is full as likely to increase the nourishing and strengthening power of other vegetable food, as of bread and Potatoes. Even our succulent roots, as Turnips, Carrots, &c., mashed or grated, and boiled or baked with meal of any kind, may be made as solid as desired; to substitute for, and improve on, the precious Potato, or may be mixed when dressed and hot, with chopped or crumbled bread, to pretty near the same purpose;

and with this drink of chicory (for coffee), might make a hearty working diet, very cheap, and chiefly home grown, even whilst Potatoes are dear.

But this paper of M. Gasparin's, we may hope, is only the enunciation of a *principle*, capable of much wider application than merely to coffee and succory for drink, and bread and greens, or our present grown roots for food. Extending to the feeding of other animals as well as man, in suggesting improvements in the cooked and uncooked mixtures for that purpose. The converse is curiously illustrated in the case of carnivorous animals, which M. Majendie found to require as much weight of dried meat as of meat in its raw state; though the latter is at least seven-eighths water; *i.e.* 1lb. will contain only 2 oz. of dry; so great is the effect of its state of preparation for the stomach.

These two papers, then, taken together, seem to prove that the nutritive power does not depend upon the elementary ingredients of the food only, but is much affected by their state of natural composition in the plant, and may be still further influenced by artificial adaption to the digestive organs; thus opening suggestions for more effective and, consequently, more general employment for our home products, cheaper and heartier feeding for our own labourers, and more economical production of animal food. *J. Prideaux.*

Home Correspondence.

Iron and Green Sands.—Sandstones form a very important series of strata among the geological deposits. The old red sandstone succeeds and encompasses the primary ranges of mountains, exhibiting almost the first vestiges of life, wholly in the marine form. It forms a very large step towards a habitable state of the globe, from the high temperature during the deposition of the primary strata, and is mixed with and supports the limestone, the grand support of life, before which means being provided, it would appear that no animal had lived; but, as it increases, life of every kind becomes numerous and prolific. The next sandstone is the "new red," or variegated kind, which rests upon the magnesian limestone, and is covered by the oolites. It contains the rich depository of salt, and to it England owes much of her commercial prosperity. The uppermost sandstone rests upon the upper oolite, and is covered by the chalk. It has been laid bare in South Britain, where it chiefly abounds by the denudation of the cretaceous deposit, which had extended over the whole range of the Wealden formation. The rock is divided into the lower and upper beds, or the "iron and green" sands by the gault clay, or the argillaceous member of the green sand group. The upper stratification of it is laminar rather than seamed throughout the formation, as frequent interruptions occur in irony plates and shells in various directions, which render it nearly impossible to find any seams passing throughout the mass parallel to the bounding surfaces. A stratum being formed by seams that are parallel throughout the entire mass, according to Professor Playfair, in many cases, requires several hundred feet of irregularly laminated sand to constitute a definite formation of that kind. The gault or golt beds are generally laminated, as other argillaceous deposits. The third sandstone formation of Jamieson, which contains the iron and green sands, with the intervening gault, must be reckoned a very considerable step from the very regular stratification of the flat rocks rising to the earthy formation of the surface of the globe, and losing the parallelism of the seams of deposits by the frequent interruptions of other substances. The sandstone having been acted upon by marine water, which tore from its surface the cretaceous deposit, may have derived from the aqueous sediment the ferruginous nature, which almost universally adheres to the sands of the now mentioned formation. Being placed immediately below the chalk, which is generally an earthy and a feebly aggregated mass, it becomes in many instances so cretaceous as to be hardly distinguished from the chalk itself. The upper or green sand is often wholly lost in the chalk-marl above, and the gault on which it lies, as in Oxfordshire, producing siliceous chalky stones, with evident marks of the upper green sand series. It abounds in the green silicate of iron, and reaches to the depth of 600 feet, through the gault and the iron sand, or under stratum. The deposit is abundant in Wilts, Dorset, Sussex, Devon, Surrey, Oxford, and in the Isle of Wight, and it encircles the whole of the Wealden formation of Kent and Sussex. It is most generally a highly ferruginous sand, with spheroidal or nearly irregular concretions of oxide of iron, frequently enclosing a coarse brown ochre. Fuller's earth and yellow ochre correspond in it, and also fossil wood. The depth in Bedfordshire is stated at 100 feet, and in Wiltshire at 30. The sands at Woburn, in Bedfordshire, exhibit the best specimen in Britain of the upper or green sand, and the whole formation, with the intervening gault, is beautiful shown near Reigate, in Surrey, at the Redhill cut of the mail road from London to Brighton. This spot is much visited by amateurs in geology, as in no other place in Britain can the whole stratum be so clearly examined. The upper stratum lies high on the Redhill; on the lower grounds the gault is seen near Godstone, and is called "black land," while eastwards into Kent, running by Limpsfield and Westerham, the iron sand in the form of Chertsey rocks forms a bold encampment to the South, overlooking the formation of Wealden clay. The stones are much used in building, and are shaped into troughs and chimney-pieces. The soils that strictly belong to this formation of sandstone are very worthless, and frequently pass into utter barrenness. It requires a very large mixture with loamy earth to form a land of tolerable productiveness. In wet weather it forms into hardened cakes, which impede vegetation, and during hot weather it passes into a crumbly meal of dried incoherent particles. The crops of Barley are often a total failure, by reason of the land being exposed to drought with the seed furrow. Sometimes the ears are never formed from the extended shot blade. The action of artificial manures is generally indulged on these lands, and sheep feeding of Turnips is much to be approved. Rye is the most useful cereal crop, as being sown in autumn; the land is not moved in the spring, and the winter moisture is retained by the shade of the vegetable foliage. Seed-bearing crops should be few in number, about one to three or four of the feeding crops, thus: 1. Turnips; 2. Barley; 3. Winter Tares, consumed on the land; 4. Rape, also eaten on the land; 5. Spring Vetches, also consumed on the ground; 6. Rye for seed crop, being four feeding crops to two of grain; or, 1. Turnips; 2. Spring Vetches; 3. Rye for seed crop; 4. Winter Tares; 5. Rape; 6. Barley; each grain crop having thus the benefit derived from two crops consumed on the ground. One crop of seed Rye may be joined with four feeding plants: 1. Turnips; 2. Barley or Oats; 3. Clover; 4. Tares; 5. Coles. Thus Rye, winter Vetches, Turnips, spring Vetches, and Rye for seed, can be followed by Turnip, Barley, and Clovers, and the land may be successively cropped by these plants, and kept in good condition. The present value of the land may be doubled by using the above directions. *J.D.*

Drainage Acts.—Your correspondent, "J. T., Swansea," has certainly very great reason to complain. That anything like so preposterous a sum, for expenses, as 34*l.* out of 400*l.*, should be deducted by the Board is "too bad." What upon earth is it for? The two visits of the Assistant-Commissioner could not take more than about 8*l.* of the 34*l.*; and what, I should like to know, is the other 26*l.* absorbed in. At this rate the office expenses upon the 2,000,000*l.* will turn a very pretty penny for somebody or other; and if the landed interest do not think it worth their while to inquire a little into these matters, perhaps the tax-paying portion of the community may wish to learn something about them. But there are other matters touching the administration of affairs at the Drainage-office which, if not amended, will require to be looked into. What, for example, can be said in justification of the proviso of appointing the stewards of applicants for advances as assistant-commissioners, and of which we know of at least one instance. What confidence would the public have in the faithful conducting of such a public grant for a special purpose, and for the right application of which money the assistant-commissioner is practically the responsible party, if that responsibility is to be entrusted either to the stewards of the applicants or to any one that the applicants may think proper to nominate? Would such a mode of conducting public business be tolerated in any other department? If the charge of 34*l.*, for the instance in question, could be incurred at all by fair means, it would have been in the inspection of the work during progress (a most necessary part of the business) by the surveyor, who is required to certify to the perfect execution of the drainage. One instance has been mentioned to the writer, where, on the surveyor coming to inspect works after completion, he was induced to have some of the drains opened, to see their true depth, when, to his amazement, he found there were no pipes laid in them. We say, then, the administration of this drainage grant requires to have the public eye upon it. *An Assistant Commissioner, under the Acts.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday, the 11th of December; present, His Grace the Duke of RICHMOND, K.G., President, in the chair; Lord Portman, Lord Ashburton, Hon. Dudley Pelham, M.P., Mr. Dyke Acland, Mr. Barugh Almack, Colonel Austen, Mr. Raymond Barker, Mr. Biddulph, Mr. Bosanquet, Mr. Bramston, M.P., Mr. Brandreth, Mr. T. Brown, Mr. W. Brown, Capt. Wentworth Buller, R.N., Mr. French Burke, Mr. Catherall, Colonel Challoner, Mr. Cox, Mr. Evelyn Denison, M.P., Mr. Dyer, Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Hamond, Mr. Fisher Hobbs, Mr. C. Wren Hoskyns, Mr. Hudson (Castleacre), Rev. A. Huxtable, Mr. Cuthbert W. Johnson, Mr. Jonas, Mr. Kinder, Mr. Lawes, Col. M'Douall, Captain Moorsom, R.N., Mr. Mainwaring Paine, Mr. Pusey, M.P., Mr. Shaw (London), Mr. Shelley, Mr. R. Smith, Rev. J. R. Smythies, Mr. Thompson (Moat Hall), Mr. G. D. Trotter, Mr. C. Hampden Turner, Mr. Turner (Barton), Prof. Way, and Jonas Webb.

The following new members were elected:

Ward, G. B., Great Bentley, Colchester, Essex
Gamble, David, Gerard's-bridge, St. Helen's, Lancashire
Simpson, George, Marton, Bridlington, Yorkshire
Clunes, Major John, Woodfield, Pembroke
Simpson, John, Field House, Hunmanby, York
Green, John, Knipton, Grantham, Lincolnshire
Tredwell, John, Leigham-court, Streatham, Surrey
Leach, John, Pembroke
Tredwell, Thomas, St. John's Lodge, Upper Norwood, Surrey
Barber, William Mills, Langley Broom, Colnbrook, Bucks

GUANO.—CAPTAIN WENTWORTH BULLER, R. N. adverted to the communication lately made by Lord Palmerston to the Council relative to the supply of guano from Peru at a reasonable rate. In proof of the vast importance of guano he instanced the example of a farm in his own hands, consisting of 80 acres of poor land, for the most part lately reclaimed from heath, and rented at 6*s.* per acre. For six years past the whole of the corn and hay together, with about 30 tons a-year of Mangold Wurzel, Carrots, or Potatoes had been removed from this ground, and not a particle of any kind of manure restored or used, except guano and a little marl applied to the lightest ground, and 10 loads of dung per acre, applied in one of the six years to three acres of Potatoes. The White Turnips have been always been fed upon the ground, but everything else has been taken to a farm two miles distant. During the whole of these six years the crops upon this land have been steadily increasing. Land, which six years ago was not in itself capable of producing 10 bushels of Barley per acre will now produce from 30 to 40.

In answer to various questions, Captain Buller stated that he applied guano to all the root crops, at the rate of about 5 cwt. per acre for Mangold Wurzel or Carrots, which were to be taken off, and at the rate of 3 cwt. for white Turnips. That he took five crops in four years, and that he considered he had grown this year 140 tons of Mangold Wurzel and Carrots from seven acres of land. In reference to the supply of guano he stated various particulars as to the discovery of the Island of Ichaboe, and urged upon the Council the expediency of entering into communication with the Admiralty and the Royal Geographical Society, and endeavouring with their assistance to ascertain whether supplies of guano could not be obtained from other quarters besides Peru. It appears that the supply of good guano is limited to those regions of the globe in which little or no rain falls. These rainless regions are only found for two or three degrees on either side of the tropics, and are generally distinguished by deserts or that sterility which follows the absence of rain. Thus the Great Sahara under the northern tropic in Africa, and the Little Desert under the southern tropic, where the Island of Ichaboe was discovered. It was from the prevalence of deserts that these parts of the world were so little known. Ships rarely visited such coasts, and much of the coast of Africa under the northern tropic was, for this reason, still very imperfectly known. It was stated in several of the voyages of the Portuguese and other of the early discoverers who had visited this coast, that sea-fowl abounded in various parts, and it was especially mentioned that in the Bay of Arquin, near Cape Bor, they were so abundant that the crews had filled two boats with the eggs, and as this was a rainless region, there were strong grounds for supposing that guano in considerable quantities existed in the Bay of Arquin. If this were so, it would be so much more valuable, in consequence of being within so short a distance of this country.

A few years ago a merchant in London had been induced by a statement of these facts and the evidence taken from various old voyages, to send three ships for the purpose of exploring, and if possible loading with guano from Arquin; but on the arrival of the first ship, a boat having been incautiously sent on shore; the crew had been attacked by the Arabs, and the whole either killed or taken prisoners. Upon this disaster, the ships had all sailed away, and loaded elsewhere, while the existence of guano in this spot still remains doubtful. Shortly after this occurrence, he believed that the Admiralty had dispatched a vessel of war to Arquin to endeavour, if possible, to rescue some of the boat's crew; and it was possible they might have made some inquiries, and have some information to give respecting guano. There were many other places, as parts of the Red Sea, and the Gulf of Persia, which were known to be rainless, and which were scarcely ever visited on that account; and he thought it would be very easy and very desirable for the Admiralty to give general instructions to the captains of all ships employed in or near those stations to make inquiries, and report to the Admiralty as to supplies of guano. The existence of a large number of sea birds (especially the penguin) in a rainless region were indications which could scarcely be mistaken.

The thanks of the Council were voted to Captain Buller for his kindness in making this communication.

Captain Moorsom and Mr. Robert Smith then favoured the Council with important information connected with the supply of guano to this country.

Mr. Hudson, of Castleacre, stated a case in which an analysis by Professor Way, of manure offered to him for sale, had proved of the highest value in determining the value of the manure, and the price at which it ought to be supplied.

The Chairman, Mr. Shaw, Mr. Turner, Colonel Macdouall, Mr. Jona, Mr. Acland, and Mr. Paine, detailed to the Council their experience in the purchase of guano.

NIPAL BARLEY.—Capt. C. R. DRINKWATER BETHUNE, R.N., C.B., of the Harbour Department in the Admiralty, transmitted to the Council a small supply of skinless Barley, weighing about 200 grains, and marked "Nipál, 1850," received from his brother, a member of the Society, at present residing in India. The Council ordered their best thanks to be conveyed to Capt. Bethune, for this attention to the objects of the Society; and at their request, Mr. Shelley and Mr. George Turner undertook to try the cultivation of this Barley on their respective farms in Sussex and Devonshire.

CREOSOTED-FISH MANURE.—MR. BETHELL, of 8, Parliament-street, transmitted to the Council the following statement of the trial of empyreumatic fish-oil manure on the growth and preservation of Potatoes,

addressed to him on the 29th of November last by the manager of the Orphanage establishment, near Hounslow.

"Nov. 29, 1850.

"Dear Sir,—I am glad to be able to inform you that the boys of the Orphanage have dug up all the Potatoes, and that they are all entirely free from any symptom of the disease, which I believe is due entirely to the creosoted fish, as almost all the crops in this neighbourhood were more or less struck with the blight or disease, whilst our plants remained green and perfectly untouched. The 20 acres of ground which we planted were of a very poor and gravelly soil, so poor, that the previous occupier declared that nothing would make that land produce Potatoes. We planted in it Regents and Forty-folds, with about 8 cwt. of your creosoted fish per acre, and without any other manure whatever. In planting, the boys dropped a piece of the fish in the furrow near the Potato set, and the plough following earthed them over. The crop is, as near as we can estimate it, about 100 tons, and the Potatoes are all of excellent quality, and without a speck of a disease: I hope to plant with Potatoes a much larger extent of land next year, to all of which I will apply the fish; but as the land is very poor, I intend putting 10 or 12 cwt. of fish per acre, as we found that where by accident the boys had put more fish, there the crop was much heavier, and the Potatoes larger. I had the curiosity to weigh some of the largest Potatoes, amongst those that had by accident had an increased quantity of the fish manure, and I found some of them to weigh 1½ lb. each, and one, 1¾ lb. I have kept them as extraordinarily large. I anticipate an extraordinary crop next year, and I shall astonish my neighbours even more than they have already been."

Mr. Bethell also favoured the Council with specimens of the Potatoes themselves, which were of healthy appearance, and of large size, being found on boiling to be of excellent quality, without the slightest taint of fishy flavour.

Animal Carcase Manure.—Mr. R. M. Gillies, of Mark-lane, one of the Governors of the Society, favoured the Council with specimens, in stopped glass bottles, and in various states of preparation, of the new South-American manure, obtained from the flesh and bones of the large herds of wild cattle in that continent, slaughtered for the sake of their hides, after the tallow has been extracted from their carcases by steaming. This residue was formerly thrown aside as useless; but being well known to possess powerful manuring properties, it has attracted the attention of the South-American merchants, and being well dried previously to shipping, it is about to be imported largely into this country, on account of the great demand and exorbitant price of Peruvian guano. This manure has been analysed by Professors Anderson and Way, and by Mr. Teschemacher, and found, as might be expected, to contain a large amount of fertilising matter. It has been applied with great success to the Turnip crops and Grass lands on Colonel Long's farm at Bromley Hill, in Kent.

Ventilation.—Mr. Septimus Braithwaite, of Wareham, Dorsetshire, exhibited to the Council an apparatus used with great success for the last 18 months in France, for the purpose of ventilating stables and farm-buildings generally, by spiral vanes, allowing by their rotation the fresh air to gain an entrance in one direction, and to pass out in another.

Farm-Accounts.—Mr. Hudson, of Castleacre, presented to the Council a printed form of accounts he had employed for many years with the most satisfactory results; and which admitted of being separated, and forwarded leaf by leaf to the various parties employed by him on his several farms, returned to him filled up at stated times as he might direct.—Mr. French Burke also forwarded to the Council a copy of his new work, entitled, "An Improved System of Farm Book-keeping."

The Council ordered their best thanks for the favour of these communications.

Lord Stanley, of Alderley, transmitted, by direction of Viscount Palmerston, for the information of the Council, a work, received from her Majesty's Consul at Boulogne, on the prevention of Potato disease, by autumn-planting, founded on the six years' observation of M. Le Roy-Mabille, of that port.—Mr. Strafford, of 3, Camden-villas, Camden-town, presented a copy of the 9th volume of his continuation of "Coates's Herd Book;" containing pedigrees of improved short-horned cattle, illustrated by 11 original lithographic portraits of celebrated animals of that breed.—Dr. Plomley transmitted a copy of his work on the natural history of the Hop-fly and its enemies.—Mr. vom Hof sent for inspection various specimens of Wheat grown on very poor land in Kent from seed prepared by Bickes's steeping liquor.—Messrs. Dean and Son presented a copy of their work on Prize Model Cottages; and Mr. Tidd, copies of plans of the Islington cattle market, with the proposed additions.—Mr. Dyke Acland presented a copy of his printed letter to Mr. Miles, M.P., containing a proposal for the establishment of annual agricultural meetings, consequent on the meeting of the Royal Agricultural Society at Exeter, to be held successively in different towns of the West of England.—Mr. H. Mayhew transmitted a copy of his report connected with "Labour and the Poor." For these presents, and others made to the Society, including numerous periodical agricultural works, published in this country and abroad, the Council ordered their best thanks to be returned.

A Special Council was held on Thursday, the 12th of December, for deciding, agreeably with the terms of the bye-laws, on the prizes to be offered for live stock next year: present, his Grace the Duke of Richmond, K.G., President, Lord Portman, Hon. Dudley Pelham, M.P., Mr. Raymond Barker, Mr. S. Bennet, Mr. H. Blanshard, Mr. Brandreth, Mr. W. G. Cavendish, M.P., Mr. Walbanke Childers, M.P., Mr. Fisher Hobbs, Mr. Hudson of Castleacre, Mr. Shaw of London, Mr. Shelley, Mr. Robert Smith, Mr. Turner of Barton, and Mr. Jonas Webb.

The Council decided on the details and classification of the prize-sheet to be adopted for next year, of which the following schedule represents summarily the divisions and their respective amount of prizes assigned to each:—

Short horns	£215	Brought forward	£1165
Herefords	215	Leicester sheep	170
Devons	215	Southdowns, and other short-woolled sheep	170
Long-horns	40	Long-woolled sheep (excluding Leicesters)	85
Channel Islands breed	40	Sheep best adapted to a mountain district (excluding Southdowns)	50
Sussex breed	40	Pigs	130
Scotch horned cattle	45		£1770
Scotch polled cattle	45		
Welsh, Irish, and other pure breeds	40		
Horses	270		
	£1165		

The Council decided that no "extra stock" should be allowed to be shown next year. They also agreed that the rules and regulations of the Show should be taken into consideration at the monthly Council in February next.

A Special Council was held on Friday, the 13th of December; present, His Grace the Duke of Richmond, K.G., President, in the chair; Lord Camoys, Mr. Raymond Barker, Mr. Brandreth, Colonel Challoner, and Professor Sewell. The report to be made by the Council to the ensuing General Meeting of the Society, was arranged and agreed to.

General Meeting.—The half-yearly General Meeting of the Society was held at the Society's House, in Hanover-square, on Saturday last, the 14th of December. His Grace the Duke of Richmond, K.G., President, in the chair.

Mr. Hudson, the Secretary, read the following report from the Council:—

REPORT.

The Council have again the satisfaction of reporting favourably of the progress made by the Society in the attainment of its practical and useful objects. The number of its members at the present time differs by only 18 from its amount at the date of the last general meeting, 174 names having been removed by death or otherwise from the list, while 156 new members have, during the same period, been elected into the Society, which now consists of 90 Life Governors, 167 Annual Governors, 648 Life Members, 4315 Annual Members, and 19 Hon. Members, making a total of 5239.

Among the Governors lost to the Society by death, the Council have to record a name illustrious from its connection with the Royal Family of England, and endeared to the nation as borne by a Prince distinguished by so many virtues as his Royal Highness the Duke of Cambridge—a name, too, familiar and friendly in an especial manner to the Royal Agricultural Society of England, on account of the deep interest taken by his Royal Highness in the formation and welfare of the Society, and his participation in the promotion of its country meetings.

The Council have to report favourably on the state of the Finances of the Society; and to submit to the Members the Half-yearly Balance-sheet of the General Account, and the Special Balance-sheet of the Country Meeting at Exeter, along with the quarterly statements of income and expenditure, assets and liabilities, funded property, and current cash account, laid before the Council by the Finance Committee and Auditors.

The Journal of the Society, transmitted postage-free to the Members in August last, will have borne to them in its own pages the best evidence of its intrinsic value. The succeeding part, now on the eve of publication, will no less, the Council believe, sustain the high character of its predecessor, and still further evince to the Society the high privilege its Members enjoy in being favoured with so large an amount of the devoted attention of Mr. Pusey, who, in his capacity of Chairman of the Journal Committee, effects that selection, arrangement, and elaboration of matter for its pages, which results in so valuable a collection of data for immediate application in given cases, and for the further advancement of agricultural knowledge. "Books," it is true, as Mr. Pusey himself remarks, "will not teach farming; but," he adds, "if they describe the practices of the best farmers, they will make men think, and show where to learn it. If our farmers will inquire what is done by the foremost of them, they will themselves write such a book of agricultural improvement as never was written elsewhere, in legible characters, with good straight furrows, on the broad page of England." The Council trust that the best practice, whether obtained from the pages of the Journal or from personal inspection of the best farming, will be thus transferred to the hitherto-neglected lands of the kingdom, and lead to results alike satisfactory to all parties connected with them. The Council are gratified to find, that of all the Journals sent to the Members by post, amounting in number to nearly 30,000 copies, only one case has been made known to them in which a Journal has not eventually reached its destination: they regard this fact as both important to the Society and as reflecting the highest credit on the postal establishment of the country.

The Council have only to refer to the Country Meeting of the Society, held at the City of Exeter in July last, with the liveliest satisfaction, and to pronounce it as complete in all its details as the Council could desire; the excellence of that meeting having been witnessed by all who had the pleasure of being present at it, and made known by public report to all others interested in its success, who were from various causes unavoidably absent. Those only, however, that were present on that occasion could be impressed with an adequate idea of the demonstrations of hearty welcome given to the Society by the inhabitants of that "ancient and loyal city;" an expression of respect only equalled by their disinterestedness and genuine hospitality. The mayor and corporation, and the local committee, anticipated by their prompt and judicious measures every wish of the Society during the preparations for the meeting, and the period of holding it. Sir Thomas Acland at Killerton, and Mr. Turner at Barton, each gave a kind and friendly reception to the Members, and submitted to their inspection their respective Water and Catch Meadows, which created a lively interest in all who witnessed them. The principal Railway Companies, with their usual liberality, conveyed the live stock free along their respective lines to and from the Show, and the implements at half the ordinary rates. The Members were indebted to Prof. Simonds for a valuable Lecture on the Diseases of the Liver in Domesticated Animals. Messrs. Tuxford, of Boston, and Messrs. Barrett and Co., of Reading, kindly placed at the disposal of the Stewards and Judges their respective steam-engines, for driving the machinery under trial in the Show-yard. The Society conveyed to all these respective parties at the time their grateful acknowledgments for the valuable services they had rendered to the Society by their cordial co-operation. The Exeter Meeting was also distinguished by a still further improvement introduced into the dynamometrical testing of the agricultural machinery, by which new results, of great importance in guiding the Judges in their decisions, were obtained; and the rival exhibitors of implements enabled themselves to judge of the actual power and working of their machines, by simple inspection of the mechanical registration of results. Colonel Challoner, the Senior Steward of Implements on that occasion, has made to the Society his report of the exhibition and trial of implements at the Exeter Meeting, including a description of the testing apparatus employed, and diagrams illustrating the momentary variation of the actual power either possessed by the steam-engines as prime movers, or required to work the various agricultural machines submitted to the test of trial. If anything further were required to prove the excellence of the Exeter Meeting, it would be the occurrence, for the first time in the records of the Society, of the receipts being equal to, or exceeding the payments on account of, a Country Meeting, independently of the Prizes awarded on the occasion; the Exeter Balance Sheet now laid before the Members showing a balance of 96*l.* 2*s.* 9*d.* in favour of the Society.

The Council, agreeably with the Bye-laws of the Society, prepared, on Thursday last, a List of the Prizes for Breeding Stock, to be offered for competition next year. This list having been printed, copies of it are now laid on the table for the information of the members.

The Council have appointed a Special Committee to take into consideration the whole question of nominating, selecting, and appointing the Judges for the Country Meetings, with a request that they will favour the Council with their report on the subject in February next. They have also appointed a certain number of their members to meet the Governors of the Royal Veterinary College, for the purpose of conferring with them on the best mode of carrying out the common object of the two bodies, namely, the application of veterinary science to the diseases of cattle, sheep, and pigs; with a request that they will report the result of their conference at the same date. Professor Simonds, the Veterinary Inspector of the Society, has reported to the Council the result of his inquiry into the occurrence of several important cases of disease amongst the stock of members in different parts of the country. These reports, when fully completed by further results of direct experiments in the feeding and treatment of the animals, will be placed in the hands of the Journal Committee.

Professor Way, the Consulting-Chemist to the Society, has continued to prosecute his interesting researches on the chemical constitution of plants and substances of agricultural use, the results of which are in the course of publication in the Journal of the Society. Professor Way has also favoured the Society since the last General Meeting with a Lecture on the Chemical Character of Water as connected with its agricultural uses.

The Council have decided, since the last General Meeting, to give Prizes for Essays on the following subjects, to be sent in by the 1st of March next:—

Farming of Shropshire	£50
Farming of Northampton	50
Diseases from mismanagement of Horses	20
Diseases of Cattle after parturition	20
Agricultural Geology of England and Wales	50
Production of Butter	10
Any Subject in Agricultural Chemistry	20

The Council have been favoured by Viscount Palmerston with important communications on the subject of the supply of Guano; and the Duke of Richmond, feeling the great importance to the farmers of this country, that so valuable a manure should if possible be supplied, not only in its genuine state, but in abundance, and at a cheaper rate, has kindly undertaken, at the request of the Council, to confer with Lord Palmerston on the subject. By order of the Council, James Hudson, Secretary.—London, Dec. 14th, 1850.

On the motion of the Rev. James Linton, seconded by Mr. Love, this report was received unanimously by the meeting.—Mr. Wingate expressed the satisfaction it gave him to find that the country meeting of the Society, so successfully held this year at Exeter, had paid its own expenses.

Colonel Challoner, chairman of the Finance Committee, having laid before the meeting the various balance-sheets connected with the accounts, it was moved by Mr. Warsop, seconded by Mr. Mark Sandford, and carried unanimously, that the best thanks of the Society should be given to the Auditors, for their care and attention in examining its accounts.

Mr. Knight, Mr. Beman, and Mr. George J. Raymond Barker, were elected Auditors for the year ensuing.

Thanks were passed to Professor Way for his Lecture on Water delivered before the members in June last.

On the motion of Sir Robert Price, Bart., M.P., seconded by Mr. Mark Phillips, the cordial thanks of the meeting were carried by acclamation to the noble Duke for his conduct in the chair on that occasion, and for the devoted interest he had so constantly evinced towards the Society, and the promotion of its most useful and patriotic objects.

The meeting then adjourned.

TRAFALGAR.—The annual meeting of the Trafalgar Agricultural Society took place on Monday, the 21st October. About 40 tenant-farmers sat down to dinner in the inn; GEORGE DUN, Esq., tenant, Grange, in the chair. The Secretary read the awards of the judges, and distributed the sum of 70*l.* of sweepstakes to the successful competitors.—Mr. HONEYMAN read an essay on "the Present Position of the British Farmer considered in relation to his Landlord:" The wealth and glory of the nation have at all times kept pace with agricultural improvement and prosperity. And it cannot be otherwise; for it is from the exertions and industry of the husbandman that all riches are derived—food, clothing, and many other of the necessaries and conveniences of life, being the productions of his labour and ingenuity. His intelligence is brought to bear upon the bleak and barren soil, and fertile fields and golden harvests are the rewards of his prowess. The tenantry entered on their present engagements on the faith of the laws of the country remaining nearly the same. They dreamed not of being under the necessity of contending with the difficulties which now surround them. Under this conviction the capital at their command was mostly invested in the soil; a great proportion in permanent improvements, being thus issued among the tradesmen and peasantry in the shape of wages. These were not expected to be immediately remunerative; still it was considered they would ultimately pay. At the end of the lease the proprietor would have come in for a share of these improvements, they being, as it were, fixtures, adding materially to the intrinsic value of the subjects. The capital required in stock for carrying on improved husbandry is triple, and in some cases quadruple, to what it was in former times. The very interest of the capital in many cases would enable the farmers to live comfortably (in retirement), even with their money invested at bank interest, apart from all the anxieties and risks incident to farm management. Farming being reduced to the present low ebb, stock will again be converted into cash (so far as practicable), and the farmer will be under the necessity of turning his attention to more remunerative investment. Land will thus necessarily fall in value. The landlord's rent-roll will exhibit a much lower figure, or farther enterprise on the part of the farmer must cease. Into whatever district we turn our eyes, improvements of every possible kind have been successfully carried on, and in no age has agriculture advanced so far as that in which we live. The fertility of the soil has been amazingly promoted, and the wages of tradesmen have been raised at least to double their former amount, and the proprietor has had a corresponding increase in the value of his land. But legislative enactments have recently been carried, which are producing material changes in the condition and prospects of the British agriculturist. Mr. Honeyman then proceeded to argue the mischief of free trade in its influence on the relations of landlord and tenant. Through the instrumentality of the aristocracy, as being at the head of affairs, the tenant farmer has been deprived of one-third of his property; and yet they stand coolly by, demanding the last farthing of rent. It is therefore in vain for them to hold out delusive hopes, or to concoct fantastic schemes in order to endeavour to raise the depressed spirits of their suffering tenantry, who are now awake to the sad realities of their condition. High farming is confidently recommended by certain landlords as the infallible panacea for all the evils consequent on free trade. It is the *ignis fatuus* of the proprietor, by the meretricious glare of which he tries to deceive the husbandman and mislead the public. The old prejudiced farmer, who has had the *dis*-advantage of becoming acquainted with the capabilities and peculiarities of the soil in nearly a lifetime's experience, is gravely advised (by my Lord Kinnaird) to rescind his old vulgar notions of cultivation, and to bring his farm to some mighty modern professor of chemistry, who will put his subject—rocks, bogs, and altogether—into his capacious alembic, and by the sublime process of alchemy increase its fertility to a double or even triple extent. I have visited the localities of some of these "high farming humbugs," where the process was being carried on in the best style of the art, and, as stated in public documents, with most astonishingly remunerative results. On minutely examining into the merits of the case, and carefully collecting and comparing every available fact, although I rank amongst the humblest, I was among the first who publicly exposed and denounced the interested, the mischievous, the monstrous calculations which certain parties were palming on the public. My talented neighbour, Mr. Ross, came forward, armed with an unconquerable array of facts, and clear common sense views, and nobly did his part in dispelling the delusion. The formidable Peter Plough next came into the lists; possessing acute perception, a clear judgment, and a refined but caustic wit, he struck the hydra a mortal wound, and it fell, never more to rise. Proprietors may try to blink the question as they may; by ingenious and specious devices they may palm their quackish nostrums on the public—justifying their conduct in exacting their former rents, blaming the farmer for want of skill and exertion in the cultivation of his land; and farther, declaring that things are yet in a state of transition, and that all will soon be well again. The farmer is not to be hoodwinked; to him it is quite apparent that one of three cases must happen—that some important alteration in the present laws be made, or landlords must make a proper adjustment of rent; or else the farmer himself must be subjected to deep and inevitable ruin.—The gains and profits from farming (even in past times) are far inferior to those arising from manufacture and commerce. Now by investing the same amount of capital in manufacturing or commercial speculation, quicker and more extensive profits are procured. The trader can turn over his capital three or four times a year, while it is impossible for the farmer to procure a full return even at 12 months' sight; and where extensive improvements are being carried on, it is only at a yet more distant day that he can hope for a return. None of these delays lies in the way of the trader. When his purchase is consummated, he can convert his commodity into money, and again commence fresh speculation. It is thus apparent that much less capital is sufficient to carry on a more extensive business than if employed in farming; and from the shortness in the period of the trader's outlay, he can avail himself of more extended credit than it is possible for the farmer to enjoy. The articles required for farm stock can never be had unless for cash—the farmer need not go to the market without the money in his pocket. This is not felt by the trader. The present system of banking refuses none of them credit, unless they are unknown, or not known to be deserving of confidence; but it possesses certain features unpropitious to the husbandman. Might not a system of banking be established exclusively for agriculturists, constructed so as to obviate his wants more readily? But without insisting upon a point which may be considered alien to the subject, it is indisputable that greater amounts of capital have been attained by manufacturers and commercialists than have been realised by agriculturists. Admitting that the remuneration for outlay in farming is so very low, that bank interest on the capital would be preferable, the question very naturally arises—How is it that a farm lease is scarcely in the market when a greater number of candidates appear, offering an equal, and in some cases a higher rent than that previously given? Among a number of reasons, I may state, in the first place—a farmer already in possession of a farm becomes a candidate on the grounds that, his own farm lying contiguous, he is enabled to work the lands upon a cheaper scale than if he were a resident. He can carry on the various operations of farming with more facilities than if on a small scale, and particularly if the nature of the soil differ in quality from that he already possesses. As an instance let us suppose that the one is composed of strong land: being well adapted for Wheat, he is enabled to proceed with double force at the critical seasons of Wheat sowing—thus, in many instances, almost securing his crop, compared with the slow process he would otherwise have had to adopt, the weather at these seasons being very variable. Secondly, the land being of a lighter and cheaper description, he can raise a far greater weight of Turnips (on such land) for his money, and enriching both subjects by a greater quantity of litter in the one case, and an extra quantity of Turnips in the other, consequently enabling him to maintain a greater quantity of live stock. It is thus supposed that both belong to one landlord; and although they do not, the advantages, particularly in sheep husbandry, are very great. Another reason may be, that individuals habituated to agricultural avocations, and having spent the better portion of their time and energies in acquiring a knowledge of the science, it is almost impossible for them to turn their attention to other pursuits; consequently they bid to the last possible farthing they consider they can draw from the soil (of course after paying incidental expenses). Again, many are possessed with perhaps a foolish notion that they have a superior knowledge of cultivation to their predecessor. And, lastly, I shall mention a numerous class whom we may denominate amateurs, having little or no knowledge of agriculture, and labouring under a false impression that to be a practical farmer they have to get a lease granted them, and say unto the fields, "Bring forth for the harvest."—Mr. HONEYMAN read the following resolutions, which he moved the adoption of: Resolved that, 1st, Although this Society fully appreciates the value of a knowledge of the principles of science in its applications to practical agriculture, yet it has no sympathy with those who are continually holding up Scotch farmers as examples of industry, and famous for paying high rents, but who commonly turn round and taunt them with want of skill and science in cultivation. 2d, The amount of capital now required to carry on the operations of husbandry is so much increased that the security and safe investment of it in the soil must become a matter of paramount importance in the advancement of agriculture. 3d, If a higher standard of farming be now considered necessary to meet the change of circumstances under which farmers are at present placed by the depreciated value of agricultural produce, such high farming can only be attained by a right appreciation of its requirements on the part of the landlord, whereby mutual confidence between him and the tenant may be secured, so that such conditions of fertility as ought to be regarded as necessary fixtures, and as adding materially and permanently to the value of a farm, may be maintained to the termination of a lease, without prejudice to the interests of the outgoing tenant.—Mr. CARSWELL, of Rathillet, in proposing a vote of thanks to Mr. Honeyman, said that while he was very far from agreeing with the spirit and manner in which many of the topics had been discussed, he thought they were under great obligations to him in coming forward when requested by the Society, and in freely putting forward his sentiments in the talented manner he had done; he thought that the members would do well to avoid the political aspect of the question, and keep as closely by the resolutions as possible. A vote of thanks was heartily responded to.—Mr. RUSSELL, tenant, Kilwhiss: I differ widely from Mr. Honeyman, in many of the conclusions which he has come to, but have much pleasure in seconding the first resolution, which has been put to the meeting, and in giving my assent. I beg to state my reasons and grounds. We all readily admit that a true knowledge of the principles, upon which the art of culture depends, will assuredly lead to economical results in the details of husbandry. The rapid strides which chemistry and the kindred sciences have made within the present century, have thrown much light on the *rationale* of many of our practices. The deep researches of the genius of Liebig afforded him materials to link together the disjointed and fragmentary labours of other hard workers in the same field; and the seeds which Tull, Young, Davy, and others had sown, are now beginning to burst into luxuriance. Liebig's beautiful theories of vegetable and animal nutrition took the world by surprise. Great expectations were formed from the truths which were revealed in the laboratory of Giessen, but they have only laid the foundations for a superstructure which later generations will have to rear. Some men of sanguine temperament seem actually to have believed that the exhausted ground was to have its virtues renewed, and to be fertilised as by the wand of a magician. But, alas, the old antidote still stares us in the face, and ever will do so, that the grateful earth will only yield her riches, through the hard and unremitting toil of her sons. Science can only shorten the way. I cannot omit this opportunity of referring to the Agricultural Chemistry Association of Scotland, in its present efficiency, as scientific progress in the right direction. If its merits could not be defended on far higher grounds than as a terror to those who would carry on extensive adulterations of artificial manures, it is worth more than triple the money that is spent upon it. The introduction of the scientific element has, however, had its disadvantages; for straightway there arose a host of interpreters, who took great delight in disputing the experience of the practical men, and who looked with contempt upon the past, and wholly became the worshippers of the untried and the fanciful. A crisis has arrived, which all admit. The cultivator would fain have the recipient of his toils bear part of a burden which must be borne; but, no, science would interfere, and tell him he must carry it all himself. The whole island is ransacked for his behoof. There never was a period when so many physicians prescribed for agriculture, without knowing or studying her organic and local maladies. Some cry out, "plough less, and graze more;" others the reverse. Each nostrum, however, serves its day, and time flies on. We, Scotch farmers, have stupidly lost our renown; or doings, which were formally boasted over the whole world, are now treated with contempt, and all because we want science. Petty writers shelter themselves under great names, and join in the common hue and cry. The following isolated sentence appeared in a "Scotch Magazine" of last month:—"The agricultural produce of our island might be doubled, by a more perfect application of the principles of botany and chemistry." I need not add to this. Who are the modern guiding stars that we are directed to look to? Mr. Huxtable, amid all his scientific bravery, has scarcely faith in the new order of things. Statesmen are, however, directed by him in his recent pamphlet, if need be, to the proper objects for taxation. What comfort do we Scotch farmers obtain from his definition of an "agriculturist." Hear him—"For myself, as an agriculturist, that is, a producer of Wheat, beef, mutton, and pork, I should deprecate the reimposition of any duty whatever upon lean cattle, Beans, Oats, Barley, Lentils, and oilcake." We are allowed to shiver in our ungenial climate, that science (!!) has given out to the forest zone, and placed on the verge of that territory, beyond which Wheat will not ripen. This proposition in Mr. Huxtable, for a good price of Wheat, has its

root in the same circumstances which prompted the Herts farmers in 1810 to maintain that a quarter of Wheat should be four times the price of a quarter of Oats. Mr. Huxtable is exceedingly happy and courageous, when he imagines he is in possession of the real chemistry of agriculture, the principles of which he has taken upon him to enunciate to the unchemical reader. He breaks out into the following raptures in regard to Mr. Lawes', of Rothamsted, experiments on Wheat and Turnips:—"Experiments," he exclaims, "so admirably arranged and philosophically interpreted, that they have revealed what lay all concealed through the dark ages of mere practice, the laws which govern cereal growth, and have reduced the conditions of Wheat and Turnip growing within the cognizance of fixed principles." Mr. Lawes deserves much praise for the labour he has bestowed in arranging the experiments in question. In this respect they are the best extant. But the refined distinctions which have been drawn between the requirements of the two classes of plants have no existence whatever in nature. Mr. Huxtable does not act upon them. The whole spirit and practice of the Scotch system of farming are directly opposed to such doctrines. We are surprised that the Royal Agricultural Society, under the guardianship of a consulting chemist, has not seen through the fallacy. We do not despise nor underrate Mr. Huxtable's labours. His theory may be erroneous, but his practice might still command attention, if he could boast of results, just as any one may do who has no pretensions to science at all. Whoever thinks he possesses the true secret, although it may be a mere delusion, yet it will fortify him in his pursuits, and with industry and common sense to carry out the maxim of no want, no waste, he may accomplish wonders. And by all means give science the credit if he still desires it. The alchemists were cheered and invigorated with their *caput mortuum*. Most unfortunately for us agriculturists, we are making too many discoveries to be all genuine. We cannot be expected to come up to Mr. Mechi in his ever-hopeful ever-brilliant anticipations. Those who have a wish to see the encroachments of the Wheat on the heather, should by all means pay him a visit—he is a true farmer's friend in every respect. We have no wish to see his balance-sheet. It must be so far a caricature on Nature, as well as art. What are the grand results? Good heavens! were the ghost of Jethro Tull to pick up a statement of what Mr. Huxtable calls the "rural sums" of this celebrated Essex farm, he would exclaim—"A mountain in labour—the beast's ordure from 1000 qrs. of corn and hundreds of tons of Turnips to raise 500 qrs. of Wheat! Where is my hoe plough? have the plants lost their mouths?" No, we might be tempted to reply, nor have the "ungrateful bullocks" lost their stomachs. Modern science has shown that there is no pasture for the "King of Grains" here. Tiptree-heath is 5 quarters per acre, below zero. But if we descend and notice other enunciations of the "great principles," how painful does it become to the lover of pure science when we see agricultural chemistry personified in an astro-meteorologist—a disciple of Zadkiel—holding a Carse landlord and his tenantry in gaping wonder and amazement at an unmeaning lecture on the science of farming, and, as usual, give them scientific flattery as a prologue to scientific censure—the one being as undeserved and useless as the other. Who was it that lowered science in the eyes of the practical men in this neighbourhood, but he who, enjoying a great reputation, stoutly demanded that a field should be thoroughly and artificially drained, which was naturally capable of swallowing every drop of water which falls in the district for a mile around it. Must we actually humble science with her own doings, before she will know her true office? The modern agricultural tourists would afford ample materials for illustrating the quackery of science, from the "Thunderer" downwards. It may be amusement to them, but it is not so to us. Influential parties think all can be done without any effort on their part, and no doubt they have high authorities to quote for their backwardness. They are not inclined to view our position as the result of circumstances, by which we have been moulded to the peculiar pressure that we have been subjected to from within and without. Every system of agriculture in its infinitely varying relations, tends to shape itself into such forms as will present the least resistance to those elements over which she has no control, and, like the vane, will veer as the wind blows. Mr. Milne, of Milne-graden, after a residence of some months in England, sees many strange practices, and his faith becomes shaken in the "intelligence and zeal" of the Scottish farmers. But he is sadly puzzled with results, for he says, "In Scotland, if the husbandry is not superior to that in England, at all events, more is made of the land, and higher rents are paid for it." It would furnish interesting matter for illustration, why the two extremes of high and low farming meet so closely in one important item, that of rental. Take Ireland on the one hand and Norfolk on the other. Norfolk fortunately had a more sterile soil, and a less fertile climate, which unfitted her for the Irish rotation. Barbarian cultivation was at once overthrown towards the end of last century, as soon as the more refined wants of a rising commercial nation had to be supplied. Ireland's bounties have been turned into a curse. Human nature is the same everywhere—why be so fond of gilding the distance? A good example, and the encouragement of industry and capital, will as certainly produce satisfactory results at home as abroad. With what comparative complacency must our Aberdeens, Richmonds, and Leicesters view the present writhings of agriculture, when they have the satisfaction of having done their duty? It is not science or climate which has effected this. There is no country in Europe which is more favourable for a system of large farms than Britain. Much has been done; and notwithstanding our difficulties, I still think that we have a good field before us, if mutual and intelligent relations are maintained between landlord and tenant. This is, however, the real difficulty. For I must confess, that if a system should exist in which it is the interest of any party that the first part of a long lease is spent in bringing a farm into condition, and a certain period is required to bring down the standard of fertility before its termination, such must have within itself the elements of decay. Government grants for particular ends only show that the relation between landlords and tenants is defective. An old established art should lay her own foundation out of her sweats and toils, instead of being pampered up by mistaken friends who will do her no real good, but will only more surely lower her status. Such being my opinions, I heartily second the resolution.—Mr. Dingwall, tenant, Ramornie, in seconding the next resolution, gave an interesting review of the progress which farming had made, and contrasted the present attainments with the past; in every stride which had been, or was likely to be taken, the necessity of capital to develop the resources of the soil was only more prominently brought out; he was sure that the resolution would commend itself to every one.

Mr. Haxton, tenant, Drumnod, said: I cannot agree with Mr. Honeyman in his wholesale condemnation of high-farming and its advocates. I do not stand here as the apologist or defender of Lord Kinnaird's doings and sayings, but, while allowing every credit to Mr. Honeyman for disinterested and honest motives in his statements to-night, I would also claim from him the same liberal interpretation of the motives of those whom he has thought fit to censure so unreservedly. Such expressions as "high-farming humbugs" are neither edifying nor argumentative, and although excusable in the heat of unpremeditated discussion, are altogether unpardonable in the pages of a written essay. High farming has doubtless suffered in the estimation of the agricultural public from the indiscreet zeal of some of its advocates; still this does not affect the principle sought to be established, that high farming, intelligently and skilfully carried out, is preferable to low farming, even in a money point of view. Mr. Caird was perhaps unfortunate in selecting as a successful and profitable instance of high farming a farm altogether *sui generis*, and consequently his arguments failed to produce conviction in the minds of the great majority of farmers, simply because they were based upon an exceptional case; still, notwithstanding this mistake, the principle which Mr. Caird has assumed in the title of his much spoken about and much written about pamphlet is unassailable, viz.:—that high farming under liberal covenants is the best substitute for protection. This statement cuts both ways, and is equally instructive and admonitory to the landlord as to the tenant. It seems palpable to the meanest comprehension that if a substitute must be found for protection the best is surely that which increases the produce of the soil, with a corresponding rate of profit both to owner and occupier. But this assuredly can never be the case so long as the landlord stands aloof, and leaves the tenant to struggle as he best may with the difficulties of his new and untoward position; neither will it do for him to say to his tenant, "Farm higher, and raise more corn and stock, to meet the depression of markets." No, we must have something more than this. If there be no diminution of rent there must be an equivalent. There must be security that capital sunk in permanent improvements, and as such unrealisable during an ordinary lease, shall stand to the tenant's credit, for whatever it may be worth, and be paid to him on leaving his farm. What is the reason why the value of land is still rising, and that in the face of falling prices? Principally, I believe, because many improved farms have come into the market, and upon which the former tenants have spent and lost their capital. Under such circumstances it is not surprising that land should still keep its value, seeing that both the landlords and the new tenants have so much of the old tenant's capital in the shape of unrealised outlay, to divide between them. What we want from our landlords, and what it is their duty to give us, is the adjuncts and accessories of high farming; suitable farm offices, good fences where these were necessary, protection from game, liberal leases, rents at least one-half in grain, and a reasonable tenant right. It is for these reasons that I support Mr. Honeyman's third resolution.—Mr. Mitchell, tenant, Lordscairnie, expressed himself as much gratified with the proceedings of the evening. He stated that he laid out a great sum of money in improving his farm, and he would ask the meeting to tell him how he could best take it out towards the close of his lease; he was told that they rather wished him to devise means to have it kept in, and be compensated for it.—Mr. Honeyman said that a most important privilege devolved on him, in selecting a member to read a paper for next year. He begged to name Mr. Landale, East Hall, and would take no denial, as it was an old watchword at "Trafalgar" that "every man must do his duty."—Mr. Landale accordingly consented.

Notices to Correspondents.

Analysis: *E.G.* The relative proportions of the earths will determine the texture of the soil, and the proportion present of vegetable matter, alkalies, ammonia, and the phosphates, will determine the fertility of a soil or the fertilizing influence of a manure.—If you have any friend a member, he can take you to the lectures of the society.

Potatoes: *To-morrow.* We intend waiting till February ourselves; but if we had the manure we might be tempted to plant now. Farming in the west of England, where Axbridge Kidneys, Prolifics, Scotch, and Noblows are the standard sorts, we do not know Regents. They are well known in Covent-garden. If you plant now, set them 6 to 8 inches deep by the spade.

Poultry Houses: I much wish that your correspondents "William Kidd," and "R. H. Bowman," would give the dimensions of their poultry houses and walks. I was glad to see the advertisement of the Birmingham Poultry Show in your columns. It will be well if this example is followed. *W. H.*

Railways: *An Old Sub.* Mr. Neilson, of Harewood, near Liverpool, has used them to some extent, we believe.

Salt: *G S.* In dairy countries it is customary to put a peck of salt in the rick with a ton of hay. In feeding we use a very salt liquor to throw over chaff, so as to wet it all, and make it taste a little salt. A handful of salt to a bucketful of water; we have no more definite proportion at hand. But the best way is to keep a lump in the manger and let the cattle lick it when they please. About rats—see a pamphlet entitled "Rat! Rat!! Rat!!!"

Errata: Roe Deer: In the reply to query relating to disease in roe deer, 5 drachms is stated instead of 5 grains of tartarised antimony. The former dose would kill the animal. *W. C. S.*—Boarded Floors: The opening should be full 1 inch and ⅞, not 17-8ths. *J. Mechi.*

*** Communications reaching town after Wednesday cannot be answered till the following week.

Markets.

COVENT GARDEN, Dec. 21.

Hothouse Grapes and Pine-apples are quite equal to the demand, and the same thing may be said of Apples and Pears. Oranges and Lemons are plentiful. Nuts have not altered since our last account. Forced English Strawberries have made their appearance in small quantites. Among Vegetables, there has been some excellent Seakale, and a little Rhubarb has been supplied. French Beans are cheaper. Carrots and Turnips are good in quality, and so are Potatoes. The latter are getting dearer. Lettuces and other salading are sufficient for the demand. Mushrooms arecheaper. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Gardenias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Pommegranates, each, 3d to 6d
Grapes, hothouse, p. lb., 4s to 6s	Almonds, per peck, 6s
— Portugal, p. lb., 8d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 1s to 3s	Chestnuts, per peck, 2s to 5s

COAL MARKET.—Friday, Dec. 20.

Hollywell, 15s. 6d.; Eden Main, 16s.; Hartley, 14s.; Wallsend Riddell, 15s. 3d.; Wallsend Haswell, 17s.; Wallsend Hetton, 17s.; Wallsend Lambton, 16s. 9d.; Wallsend Stewarts, 17s.; Wallsend Tees, 17s.—Ships at market, 498.

POTATOES.—Southwark, Dec. 16.

The Committee report that there have been but three or four cargoes arrived since our last week's report, but the arrivals by rail have been so unprecedented that we have no alteration to quote in prices. The following are this day's quotations:—York Regents, per ton, 90s. to 100s.; Scotch do., 70s. to 80s.; Wisbeach do., 70s. to 90s.; French whites, 70s. to 80s.

SMITHFIELD, Monday, Dec. 16.

This being the annual great market, we have a large supply of very fine Oxen. The number is larger than can be remembered on any former occasion. A great many cannot be sold, and we cannot quote more than four shillings for the choicest kinds. The supply of Sheep is not very large, nor is the average quality as good as usual. Our general quotations are improved, and in some instances Sheep have made more than we state. Good Calves are not plentiful; prices are rather better. From Holland and Germany there are 450 Beasts, 2560 Sheep, and 117 Calves; from Norfolk and Suffolk, 500 Beasts; from the West Country, 900; from Scotland, 600; and 3500 from the northern and midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	10 to 4	0	
Best Short-horns	3	6 — 3	8	
2d quality Beasts	2	8 — 3	4	
Best Downs and Half-breds	4	0 — 4	2	
Ditto Shorn	...	... —	...	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	3	6 to 3	8	
Ditto Shorn	...	... —	...	
Ewes & 2d quality	2	10 — 3	4	
Ditto Shorn	...	... —	...	
Lambs	...	... —	...	
Calves	...	 3	0 — 4	4
Pigs	...	 3	0 — 4	0

Beasts, 6341; Sheep and Lambs, 26,030; Calves, 180; Pigs, 290.

FRIDAY, Dec. 20.

The number of Beasts is large, and the butchers having for the most part provided for Christmas, the trade is very slow, and Monday's quotations can scarcely be obtained. Although the supply of Sheep is great, a considerable proportion are foreign and middling quality, consequently the best descriptions sold as well as on Monday. Calves are plentiful; trade is slow; prices are with difficulty supported. From Holland and Germany we have 495 Beasts, 2040 Sheep, 198 Calves, and 10 Pigs; and 85 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	8 to 4	0	Best Long-wools	3	6 to 3	8
Best Short-horns	3	6 — 3	8	Ditto Shorn	...	... —	...
2d quality Beasts	2	10 — 3	4	Ewes & 2d quality	3	0 — 3	4
Best Downs and Half-breds	4	0 — 4	2	Ditto Shorn	...	... —	...
Ditto Shorn	...	... —	...	Lambs	...	... —	...
				Calves	...	... 3	6 — 4 0
				Pigs	...	... 3	6 — 4 0

Beasts, 1625; Sheep and Lambs, 5720; Calves, 335; Pigs, 392

MARK LANE.

MONDAY, Dec. 16.—The supply of English Wheat to this morning's market was moderate: fine dry samples were sold on the terms of this day se'nnight, but a large quantity being much out of condition, could only be disposed of in proportion to the same, and a part remained on hand at the close. Foreign met but a retail inquiry, which was chiefly confined to the finest white or inferior qualities; prices are unaltered. Barley must be written 1s. per qr. cheaper, excepting a few picked English samples. Beans are also 1s. per qr. lower. The value of Peas is unaltered. Oats are in good demand, and 6d. per quarter dearer. The Flour trade is dull; foreign and country marks barely maintain our quotations.

FRIDAY, Dec. 20.—The arrivals of Wheat, English and foreign, during this week, have been good, but moderate of other articles. To-day's market was thinly attended; the Wheat left over from Monday could not be disposed of at 1s. per qr. decline; but in the few transactions that occurred in foreign, that day's prices were obtained.—Barley is a heavy sale.—We observe no alteration in the value of Beans, Peas, or Oats.—Flour is a dull sale at late rates. Floating cargoes of Wheat are obtainable, at a decline of 1s. to 2s. per qr.

LIVERPOOL, FRIDAY, DEC. 13.—The arrivals into this port of English and Irish grain are still scanty; we have, however, a moderate import of Wheat and Flour from the United States, and a large supply of Flour from France. At our market today we have few country buyers, and our home millers are still on the reserve, and but few parcels of Wheat taken for Ireland; the transactions in any description of that grain have been upon a very limited scale, and late quotations barely supported. Malting Barley 1s. per qr. lower, grinding samples steady in value. Egyptian Beans are offered at a decline of 6d. per qr., and a moderate amount of sales effected; other kinds, as well as Peas, moving slowly at late prices. Oats are fully as dear as of late.——TUESDAY, Dec. 17.—At our Corn market this morning Wheat of all descriptions declined 1d. to 2d per 70 lbs. Prime malting Barley and Malt were steady and in moderate request: grinding Barley, as well as Beans and Peas, appearing to meet little notice. Oats, of which we had a few small cargoes fresh in to-day from Ireland, were in slow demand, on the terms last noted; and Oats moved very sparingly at Friday's abatement. Indian Corn, for which we had very few Irish inquiries this morning, was in limited request, but not cheaper.

GLASS FOR CONSERVATORIES,
GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS AND Co., 116, Bishopsgate-street Without, are supplying SHEET GLASS, packed in 100 feet boxes, at the following *Reduced Prices*. A reduction on 1000 feet.

SMALL SQUARES.

STANDS, for Pianofortes, 1*s.* each.

Glass Shades for Ornaments. Parian Marble. Wax and Alabaster Ornaments. Lamp Shades and Glasses. Patent and British Plate. Ornamental and Stained Glass; and every article in the Trade.

N.B. All packages charged, but full price allowed if returned free of expense.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT-FRAMES; AND PLATE GLASS FOR DWELLINGS.

THOMAS MILLINGTON begs to hand the sizes of a large quantity of SHEET GLASS, packed in 100 feet boxes.

6 by 4 ins., 6 by 4½ ins., 6½ by 4 ins., 6 by 5½ ins., 6½ by 5 ins., 12*s.* each.

6½ by 5½ ins., 6 by 6 ins., 6½ by 6 ins., and under 8 by 6 ins., 13*s.* each.

9 by 7 ins., 9½ by 7½ ins., and 10 by 8 ins., 15*s.* each.

Large sizes, 16 oz., 2*d.* and 2½*d.* per foot.

Large sheets, in 200 and 300 feet cases, 2½*d.* to 2¾*d.* per foot.

16*s.* per box; or 2¾*d.* per foot if less than one box be taken:

11	inches by 8	inches	13	inches by 9	inches
12	„ by 8	„	12	„ by 10	„
12	„ by 9	„	14	„ by 10	„

Boxes charged 1*s.* each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

CUT TO ORDER IN PANES.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6*s.* each. Wasp Traps, 3*s.* per dozen. Stands for Pianofortes, 9*d.* each.

MILK PANS 2*s.* to 6*s.* each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1*s.* for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

FURZE MACHINE.

COTTAM AND HALLEN have now brought to perfection FIRCHILD'S PATENT FURZE CUTTER AND BRUISER, for the preparing of Furze for Feeding Horses and Cattle. The Machine may be worked by horse-power, and will cut and bruise at the rate of 20 bushels per hour with one horse, a man, and boy; with two horses, 40 bushels per hour; if a steam-engine, in proportion to the power applied. The Machine is now on view at COTTAM and HALLEN'S, No. 2, Winsley-street, Oxford-street, where every other description of Agricultural Machinery may be seen.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour, is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

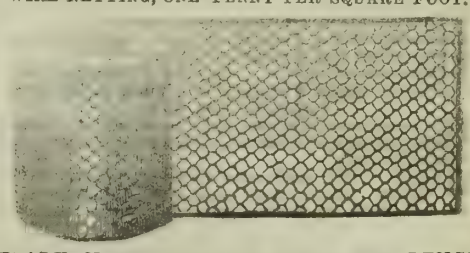
HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.



☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING. TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.	30 inches wide	7½*d.* per yard.
18 „ „	4½*d.* „	36 „ „	9*d.* „
24 „ „	6*d.* „	48 „ „	1*s.* „

Galvanised do., 1*d.* per foot extra.

RENDLE'S PRICE CURRENT & GARDEN DIRECTORY.

IS JUST PUBLISHED,
Price *Fivepence*, of all Booksellers, or
Sixpence, Stamped, free by post, of all News Agents.

It contains a Descriptive Catalogue of the best CULINARY VEGETABLES *in cultivation, with the time of sowing, height, and other useful particulars; also a Description of all the best sorts of* AGRICULTURAL SEEDS, *as well as a most comprehensive list of the choicest and best* FLOWER SEEDS, *giving the height, colour, hardiness, and duration of each kind.*

It contains also a COMPLETE CALENDAR OF OPERATIONS *in the Kitchen Garden for every month throughout the year, as well as a* GARDEN ALMANAC, *with a short description of Mr. Paxton's* "CHRYSTAL PALACE," *the Victoria Regia or Gigantic Water Lily, the Botanic Gardens, Plymouth, with other information relating to Gardens and Gardening Operations*

COPIES CAN ALSO BE OBTAINED FROM
WILLIAM E. RENDLE AND CO.,
Seed Merchants, Plymouth,
In exchange for SIX Postage Stamps.

A *Copy of our* PRICE CURRENT AND GARDEN DIRECTORY *was forwarded to* HIS ROYAL HIGHNESS PRINCE ALBERT, *and by return of post we received a complimentary letter, conveying His Royal Highness's "best thanks." Dated Windsor Castle, November* 20, 1850.

The following letter has just been received from Mr. James Barnes, the celebrated and well-known Gardener at Lady Rolle's, Bicton Gardens, Sidmouth, Devon :—

"Bicton Gardens, Sidmouth, Nov. 30, 1850.

"Gentlemen,—I beg to acknowledge the receipt of your 'PRICE CURRENT AND GARDEN DIRECTORY,' for which I beg to return you my best thanks. I have read it with much interest, and am of opinion that it will be found not only interesting, but very useful to a large majority of the gardening world.—I am, Gentlemen, respectfully, your obedient servant,

"To Messrs. W. E. Rendle & Co. "JAMES BARNES."

The following letter has also been received from Mr. Robert Errington, Gardener to Sir P. Egerton, Bart., Oulton Park :—

"Oulton Park, Tarporley, Nov. 21, 1850.

"Gentlemen,—I am much obliged by the receipt of your very interesting and useful annual—'PRICE CURRENT AND GARDEN DIRECTORY.' This is just how things should be. I have long anticipated the period when such things must take place, for we may rest assured that it is at once the duty and interest of the tradesmen to do all in his power to please his customer, and in no profession is this more requisite than in that of the Nursery and Seedsman. I have looked carefully over it, and think it does you great credit, both in the general arrangements and the very creditable degree of accuracy to be found in the details.

"I remain, Gentlemen, your most obedient servant,
"ROBERT ERRINGTON."

The PRICE CURRENT has also been reviewed in the following newspapers and magazines, in the whole of which it has been spoken very favourably of :—

The Gardeners' Chronicle and Agricultural Gazette.
The Gardeners' and Farmers' Journal.
Glenny's Journal.
The Gardeners' Magazine of Botany.
The Cottage Gardener.
The Midland Florist.
West of England Conservative.
The West Briton.
Plymouth, Devonport, and Stonehouse Herald.
Woolmer's Exeter Gazette.
The Bristol Mercury.
Devonport Telegraph.
Plymouth Chronicle.
Teignmouth Gazette.
Besley's Devonshire Chronicle.
Portsmouth Times and Naval Gazette.
The Plymouth Times.

Each House containing 1167 superficial feet, 28 ft. 6 in. long, 16 ft. 6 in. wide, and upright sashes; each side 6 ft. 3 in. high. Two ends and two Gothic doors in each house. The roofs 9 ft. each way. Sashes to run down each side of the span, and the price, in the regular way, 102*l.* each, but now can be had for the low price of 70*l.* Each House complete in every respect, and only wants a wall 2 ft. high to be placed on. One, the Roof without either wood or putty. The other, the Glass put in with putty.—E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EASTERN COUNTIES RAILWAY. CHRISTMAS TICKETS.—Return Tickets issued on the 23d, 24th, and 25th inst., will be available for the Return Journey any day up to and including Sunday the 29th. The Trains will run on Christmas day as on Sundays. By Order, C. P. RONEY, Secretary.—Bishopsgate Station, Dec. 6th, 1850.

SHROPSHIRE.—COLUMN NURSERY, SHREWSBURY, (FORMERLY BIGG'S.)

Highly important and extensive Sale of valuable Nursery Stock, comprising the most choice and healthy specimens, in great variety, of Dwarf, Standard, and Trained Fruit Trees, Deciduous, Evergreen, and Flowering Shrubs, Plants, Forest Trees, &c., being the produce of the above old established Nursery, which has long possessed a high reputation.

MESSRS. SMITH AND PREECE have the honour of announcing to the Nobility and Gentry of Shropshire and the adjacent Counties, and to Nurserymen generally, that the Proprietor has directed them to Sell by Auction, without reserve, the whole of the above valuable Stock, on MONDAY, the 30th day of December, 1850, and four following days.

Particulars may be had in Catalogues, which will be forwarded, on receipt of six postage stamps, by the Auctioneers, Shrewsbury.

MR. WM. YOUATT'S WORKS ON THE HORSE AND DOG.

A New Edition, in 8vo, with numerous Wood Engravings, price 10*s.* cloth,

THE HORSE. By WILLIAM YOUATT. With a Treatise on Draught.

Also, a New Edition, in 8vo, with numerous Wood Engravings, price 6*s.* cloth,

THE DOG. By WILLIAM YOUATT.

The above works, which were prepared under the superintendence of the Society for the Diffusion of Useful Knowledge, are now published by Messrs. LONGMAN and Co., by assignment from Mr. Charles Knight.

*** It is to be observed, that the edition of Mr. Youatt's book on the Horse which Messrs. LONGMAN and Co. have purchased from Mr. Knight, is that which was thoroughly revised by the author, and thereby rendered in many respects a new work. The engravings also were greatly improved. Both works are the most complete treatises in the language on the History, Structure, Diseases, and Management of the Animals of which they treat.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

HOUSEKEEPING, FURNISHING, COOKERY, &c. &c.

In One large Vol., 8vo, with 1000 Woodcuts, price 50*s.*

WEBSTER AND PARKES'S ENCYCLOPÆDIA OF DOMESTIC ECONOMY.

"The contents comprise everything which enters into the comfort, convenience, necessity, utility, and enjoyment of a family."—*John Bull.*

"This large volume contains scarcely a line which may not be made useful in extending the experience of young and old housekeepers."—*Britannia.*

"There is no sort of information necessary in housekeeping, which is not found in this Encyclopædia."—*Literary Gazette.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE EDINBURGH REVIEW, No. CLXXXIX.—ADVERTISEMENTS intended for insertion are requested to be forwarded to the Publishers before Saturday, the 28th, and BILLS not later than Tuesday, the 31st instant.

London: LONGMAN, BROWN, and Co., 39, Paternoster-row.

PRESENT BOOKS FOR ALL SEASONS.

New Edition, square crown 8vo, 21*s.* cloth; or 36*s.* bound in morocco, by Hayday.

THOMSON'S SEASONS. Edited by BOLTON CORNEY. With about Eighty Engravings on Wood, from Designs by Members of the Etching Club.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Of whom may be had, uniform with the above in size and price, GOLDSMITH'S POEMS. Edited by BOLTON CORNEY, and illustrated by Members of the Etching Club.

AMUSING AND INSTRUCTIVE

WORKS FOR YOUNG PERSONS.

I.

THE MIRROR OF MAIDENS IN THE DAYS OF QUEEN BESS.

By Mrs. SHERWOOD and her Daughter, Mrs. STREETEN, Authors of "The Golden Garland," "The Fairchild Family," &c. &c.

12mo, cloth, 6*s.*

II.

LETTERS TO YOUNG PEOPLE.

By the late Dr. SHIRLEY, Lord Bishop of Sodor and Man.

Fcap. cloth, 3*s.* 6*d.*

"We like the general tone of them much. They are cheerful, unaffected, kindly, without overweening conceit or laborious condescension. They refer, too, to real incidents and events."—*Athenæum.*

"It consists of letters chiefly addressed to his son and daughter; and exhibits the writer in a very amiable, affectionate, pious, and sensible light."—*Spectator.*

III.

LEILA; OR, THE ISLAND.

By ANN FRASER TYTLER.

Fourth Edition. Fcap. cloth, 5*s.*

By the same,

LEILA IN ENGLAND.

A Continuation of "Leila; or the Island."

Third Edition. Fcap. cloth, 6*s.*

MARY AND FLORENCE; OR, GRAVE AND GAY.

Ninth Edition. Fcap. cloth, 5*s.*

MARY AND FLORENCE AT SIXTEEN.

Fourth Edition. Fcap. cloth, 6*s.*

"These works are excellent. Miss Tytler's writings are especially valuable for their religious spirit. She has taken a just position between the Rationalism of the last generation and the Puritanism of the present, while the perfect nature and true art with which she sketches from juvenile life show powers which might be more ambitiously displayed, but cannot be better bestowed."—*Quarterly Review.*

IV.

THE WOODEN WALLS OF OLD ENGLAND; OR, LIVES OF CELEBRATED ADMIRALS.

By MARGARET FRASER TYTLER.

Fcap. cloth, 5*s.*

By the same,

TALES OF THE GREAT AND BRAVE;

Containing Memoirs of Bruce, Wallace, the Black Prince, Joan of Arc, Richard Cœur de Lion, Prince Charles Stuart, and Napoleon Bonaparte. Third edition, fcap. cloth, 5*s.*

V.

THE GOLDEN GARLAND OF INESTIMABLE DELIGHTS.

By Mrs. SHERWOOD and her Daughter, Mrs. STREETEN.

12mo, cloth, 6*s.*

"It possesses greater reality, and even interest, than some more ambitious-looking tales; everything in the Golden Garland bears the stamp of truth."—*Spectator.*

"It serves as a vehicle to inculcate the soundest moral precepts." &c.—*Herald.*

By the same,

THE HISTORY OF HENRY MILNER.

Three vols. 12mo, cloth, each 6*s.*

THE HISTORY OF JOHN MARTEN.

A Sequel to "The Life of Henry Milner."

12mo, cloth, 7*s.* 6*d.*

THE HISTORY OF THE FAIRCHILD FAMILY; OR, THE CHILD'S MANUAL.

Three volumes, 12mo, cloth, each, 5*s.*

JULIETTA DI LAVENZA.

18mo, cloth, 2*s.*

THE HEDGE OF THORNS.

Fifth Edition. 18mo, cloth, 1*s.*

VICTORIA.

12mo, boards, 4*s.*

THE ORPHANS OF NORMANDY.

Third Edition. 12mo, boards, 2*s.* 6*d.*

THE LITTLE MOMIERE.

12mo, cloth, 3*s.*

INFLUENCE. A MORAL TALE FOR YOUNG PEOPLE.

By CHARLOTTE ANLEY.

Fourth Edition. Fcap. cloth, 6*s.*

By the same,

MIRIAM; OR, THE POWER OF TRUTH.

A Jewish Tale.

Eighth Edition. Fcap. cloth, 6*s.*

VI.

NIGHT OF TOIL;

Or, A Familiar Account of the Labours of the First Missionaries in the South Sea Islands.

By the Author of "The Peep of Day," &c.

Third Edition. Fcap. cloth, 5*s.*

VII.

CHRISTMAS IMPROVEMENT; OR, HUNTING MRS. P.

A Tale Founded on Facts.

Intended as a Christmas-box for those who wish to begin the New Year without her.

Third Edition. 18mo, cloth, 2*s.* 6*d.*

MITCHELL'S ROYAL ALBERT RHUBARB has proved itself to be the earliest, finest flavoured, and most productive kind, as well as the best for early forcing, ever yet grown. Strong roots, 12*s.* per dozen. Also Myatt's Linnæus, 12*s.* per dozen; and Victoria, 9*s.* per dozen; with usual allowance to the trade. Post-office orders are requested to be made payable to WILLIAM MITCHELL, Enfield Highway, Post-office, Enfield, Middlesex.

A RARE OPPORTUNITY.—FOREST, FRUIT, AND ORNAMENTAL TREES, EVERGREENS, FLOWERING SHRUBS, ROSES, SCARLET RHODODENDRONS, &c., &c.

W. H. ROGERS, NURSERYMAN, 130, HIGH-STREET, SOUTHAMPTON, having purchased largely at the late sale of PAGE's celebrated Nursery Stock, can offer every sort of the above, most beautifully grown and well rooted at HALF the usual prices.

An early application is respectfully solicited.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Dec. 28.

NEW EARLY PEAS, &c.

BASS AND BROWN have a very fine Stock of the undermentioned early Seeds, which they are enabled to offer at the following low prices:—

	Per quart.—*s.*	*d.*
PEAS, Taylor's new Prolific, very early, hardy, and productive, sent out by Barnes	1	6
Essex Champion, hardy and very productive	0	8
Danecroft Rival, very early	1	3
Bishop's new Long-pod, great bearer	1	0
Early Warwick, Early Frame	0	6
Early Emperor, very early and hardy	0	10
Fairbeard's Champion of England	1	0
BEANS, Long-pod and Windsor	0	6
RADISH, early Short top Salmon	1	6
Wood's new early Scarlet	2	0

Their Wholesale List of Prices of the above and all other description of Seeds will be forwarded on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

GRAVESEND.—50,000 TREES AND SHRUBS ON SALE.—Arbor-vitæ, Berberis aquifolium, Cytisus, Cypress, Holly, Jasminums, Lilacs, Laurels, China Roses, &c., 2 to 4 feet, from 15*s.* to 40*s.* per hundred. Standard Roses, 4*l.* to 5*l.*

Aucuba japonica, Arbutus, Cotoneaster, 2 to 3 ft., 12*s.* per dozen; Irish Yews, 3 to 4 feet, 25*s.*; Standard Roses, in sorts, 18*s.* to 30*s.*

Large ornamental Trees, for immediate effect, Greenhouse and Herbaceous Plants, in great variety, at low prices.

Apply at the Cemetery, Gravesend, Kent.

MITCHELL'S MATCHLESS WINTER PARSLEY, Extra Superior for Garnishing.—J. M. having a quantity of new Seed to dispose of, can highly recommend it to Market and Gentlemen's Gardeners as the hardiest and best winter sort ever produced. Retail price, 2*s.* 6*d.* per lb. Also, his superior dark-green Savoy, 1*s.* 6*d.* per lb. A liberal allowance made to Seedsmen.—Post-Office Orders made payable to JOHN MITCHELL, Ponder's End, Enfield, Middlesex.

December 28.

KNIGHT AND PERRY, EXOTIC NURSERY, King's-road, Chelsea, London, deeply grateful for the distinguished patronage so long conferred upon them, beg to intimate that their NEW CULINARY AND FLOWER SEEDS all of the first quality, are now ready, and they most respectfully solicit a continuance of that support which has been extended to their house for the last 50 years.

For the above—as well as for their AGRICULTURAL SEEDS, to which they pay great attention, Stove, Greenhouse, and Herbaceous Plants, Bulbous Roots, imported annually by themselves from Holland, Conifers and other Hardy Ornamental Trees and Shrubs in great variety, and including many valuable novelties, Grape Vines of all the best sorts, from eyes, Fruit Trees of choice sorts, both trained and untrained, and which are this season of very fine growth—there are lists specially appropriated, and which they respectfully solicit permission to forward.

Exotic Nursery, King's-road, Chelsea, London.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

STANWICK NECTARINE—SALE OF, IN AID OF THE FUNDS OF THE GARDENERS' BENEVOLENT SOCIETY.

Circumstances have rendered it necessary to modify the intentions expressed at p. 676 of the *Gardeners' Chronicle*, respecting the STANWICK NECTARINE. Upon examining the young plants in Mr. RIVERS's hands, it turns out that the number fit for sale is much smaller than was anticipated, and that there is a considerable difference in their quality. Applicants are moreover anxious to obtain their plants without loss of time, and without waiting for the chance of an auction which cannot take place, to the advantage of the charity, sooner than next spring. It has therefore been resolved to set aside the finest plants for sale at from 4 to 5 guineas each, and to dispose of others at 3 guineas each. Such as are unsold in the spring, if there should be any left, will be brought to the hammer as at first proposed.

Of the selected specimens, some are beautiful plants in pots, budded on the Peach stock, and covered with blossom-buds, so that they will fruit next year if repotted; for these 5 guineas will be charged. The remainder are very fine maiden plants in the open quarter, budded on Plum stocks, and without blossom-buds; for these 4 guineas are required. Gentlemen desirous of aiding the excellent charity to whose funds the produce of the sale of these plants will be applied, by order of his Grace the Duke of Northumberland, are requested to apply to Mr. WILLIAM BRAILSFORD, 21, Regent-street, London, giving their exact addresses, and stating by what conveyance the plants are to be transmitted from the station at Harlow, on the Cambridge line of the Eastern Counties Railway, where they will be delivered without further charge. It is requested that Post-office orders may be made payable to Mr. WILLIAM BRAILSFORD, who, upon their receipt, will return an order upon Mr. RIVERS for the transmission of the plants.

Applications will be complied with in the *exact order* in which they are received, and due notice will be given when the five guinea and four guinea plants are exhausted.

May we be permitted to express a hope that although no pecuniary profit can be derived by nurserymen from a sale whose proceeds go to a charitable use; yet that they will, nevertheless, endeavour to make known, within the circle of their customers, the terms on which the Stanwick Nectarine may now be procured.

J. G. WAITE'S CATALOGUE OF VEGETABLE SEEDS is now Ready, with Prices to suit the times, and can be had on application.

181, High Holborn, London.

J. G. WAITE'S CATALOGUE OF FLOWER SEEDS is also Ready, and can be had on application.

181, High Holborn, London.

SION-HOUSE DWARF FRENCH BEAN, new, early, buff speckled. This is the earliest Bean known, and can be had in any quantity, price 21*s.* per bushel.—At J. G. WAITE's Seed Establishment, 181, High Holborn, London, where every other kind of Seed in cultivation can be had, on better terms than at any other House in the Trade.

RHUBARB ROOTS TRUE TO NAME.—Myatt's Victoria, 6*s.* per doz; Myatt's Linnæus, 9*s.* per doz.; Mitchell's Albert, 9*s.* per doz.—At J. G. WAITE's Seed Establishment, 181, High Holborn, London.

STRAWBERRY PLANTS.—Kitley's Goliah, 10*s.* per 100; Myatt's Eleanor, 4*s.* per 100.—At J. G. WAITE's Seed Establishment, 181, High Holborn, London.

NEW GIANT ASPARAGUS PLANTS, 5*s.* per 100. LARGE GIANT SEAKALE PLANTS, 8*s.* per 100.

At J. G. WAITE's Seed Establishment, 181, High Holborn, London.

NEW GARDEN SEEDS.

WILLIAM E. RENDLE AND CO., SEED MERCHANTS, Plymouth, are now prepared to execute orders for NEW PEAS, including the following excellent sorts.

NEW PEAS—GROWTH OF 1850.

Fairbeard's Champ. of England.	Warner's Early Emperor.
Rendle's First Early.	Prince Albert.
Burbridge's Eclipse.	Essex Champion.
Early Kent.	Early Warwick.
Fairbeard's Surprise.	Auvergne.
Bishop's New long-podded.	Isherwood's Railway.

Our "PRICE CURRENT AND GARDEN DIRECTORY" *is now ready, and contains a Descriptive Catalogue of all the best kinds of* KITCHEN GARDEN, AGRICULTURAL, *and* FLOWER SEEDS, *with a complete* CALENDAR OF OPERATIONS *for every month in the year, and a* GARDEN ALMANAC.

The present edition will be found to be very superior to the Catalogue sent out by us last year, and will be of much service to all who have gardens.

Price *Fivepence*, to be had of all Booksellers, or *Sixpence* stamped, to go free by post. To be obtained of every newsagent who supplies the *Gardeners' Chronicle*; through Messrs. Bradbury and Evans, Publishers, Whitefriars, London; or from WILLIAM E. RENDLE and CO., Seed Merchants, Plymouth.

Send six penny stamps, and a copy will be sent by return of post. This amount will be returned if desired to all purchasers.

*** *This Catalogue is stamped as a Newspaper, and contains* 24 *folio pages, being the same size as the* "Gardeners' Chronicle and Agricultural Gazette," *including the Newspaper portion.*

GARDENERS' BENEVOLENT INSTITUTION.—Notice is hereby given, that the ANNUAL GENERAL MEETING of the Subscribers to this Institution will take place at the LONDON COFFEE HOUSE, Ludgate Hill, on WEDNESDAY, the 15th January next, for the purpose of electing Officers for the ensuing year, and receiving the Accounts of the Charity for the past year. Also, for receiving a Report from the Committee on the Rules referred back to them at the last General Meeting.—The Chair to be taken at 12 o'clock precisely.

By Order. EDWARD ROGER CUTLER, Secretary.

97, Farringdon-street, Dec. 27, 1850.

SUTTON'S PRICED CATALOGUE OF HOME-GROWN GARDEN SEEDS, containing the description and *price of every article* required for the Kitchen Garden, Flower-Garden, and Farm, may be had on application, addressed JOHN SUTTON and SONS, Seed Growers, Reading, Berks, enclosing two postage stamps.

N.B.—Goods delivered Carriage Free.

MESSRS. J. AND J. FRASER'S PRICED CATALOGUE OF STOVE AND GREENHOUSE PLANTS is ready, and will be forwarded, gratis, to all applications. They also beg to observe that most of the fine specimens shown at the Chiswick and Royal Botanic Exhibitions are grown from plants supplied from their collection. The great attention paid to the plants while in a young state (without which they never make good specimens) renders this Nursery a most desirable market for purchasers.—Lea-bridge-road, Essex, Dec. 28.

CARTER'S CATALOGUE OF SEEDS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, announces the appearance of his new CATALOGUE FOR 1851, which will be forwarded, gratis and prepaid, on application by post or otherwise. He begs leave to state that the Floricultural section comprises, as usual, the Scientific and English Name of each plant, the Linnean Class and Order, and Natural Order to which it belongs; its hardiness, duration, time of flowering, and colour of the flowers, and other necessary information. The collection of Flower Seeds will comprise several splendid novelties.

GREAT WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN SEED ESTABLISHMENT, FOR SUPPLYING GENUINE HOME-GROWN SEEDS CARRIAGE FREE.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, having many Customers in the Southern, Midland, and Western Counties of England, and in South Wales, have made arrangements with the several Railway Companies, which will enable them to deliver all goods (excepting parcels under 10*s.* value), FREE OF CARRIAGE, to any Station on the Great Western, South-Western, South-Eastern, or Berks and Hants Railways (which Lines converge at Reading), or to any Railway or Packet Office in London or Bristol.

The rapidly increasing connexion and distinguished patronage enjoyed by J. S. and SONS, is entirely owing to the superior quality of their HOME-GROWN SEEDS, and the low prices charged for the newest and best kinds in cultivation.

SUTTON'S NEW PRICED CATALOGUE OF HOME-GROWN SEEDS being a careful selection of only the very best kinds of KITCHEN GARDEN, AGRICULTURAL, and FLOWER SEEDS, *with prices affixed to each article*, will, it is presumed, be found the *most useful* and convenient of any yet presented to the public.

All purchasers of Seeds would do well to peruse this Catalogue, as the low prices therein quoted will enable them to effect a great saving in their expenditure. It will be sent gratis on the receipt of two penny stamps for postage.

The undermentioned excellent sorts of Potatoes are quite free from disease, and are confidently recommended as the best sorts in cultivation, and perfectly true to their kinds.

N.B.—For Catalogues and further particulars, address JOHN SUTTON AND SONS, SEED-GROWERS, READING, BERKS, Enclosing Two Penny Stamps for Postage.

DOUBLE LILY OF THE VALLEY.—In answer to numerous inquiries for the above, and the great satisfaction given by the plants sent out by J. REID last season, he begs to state he has this year a few strong Flowering Roots to dispose of. The graceful habit, delicate appearance, and delicious perfume which the flower possesses, render it equally suitable for the Lady's Posey or the Drawing-room Bouquet. By enclosing 24 penny postage stamps, 12 strong Roots will be sent free to any part of the United Kingdom.—J. REID, Nurseryman and Seedsman, Richmond-street, Weston-Super-Mare, Somerset.

TO NURSERYMEN AND OTHERS ENGAGED IN PLANTING.

A FEW THOUSAND FOUR YEARS OLD RED CURRANT TREES FOR SALE.

Apply to Mr. BATES, Market Gardener, East Moulsey, Surrey.

Boxes charged 1s. each extra.

T. M.'s Stock of small Glass is so large, that he thinks he can pledge himself to execute orders to any extent.

Glass cut to any other size required, in either 16 oz., 21 oz., 26 oz., or 32 oz.

ROUGH PLATE GLASS.

Rough Plate Cast, perfectly flat and uniform, the best manufactured. A small sample will be sent, upon application, to prove it.

Purchasers must be cautious, as some of the articles sold under this name are of the most inferior description, being full of fire-flaws, and the metal not properly united. We only recommend the best article, being sure that no other in the end can please. Some unprincipled vendors keep good samples to show, sending afterwards the inferior, described as above.

GLASS SHADES FOR ORNAMENTS.—Our price is 25 per cent. less than any house in the Trade, and the colour far superior, which must be preferable for ornaments.

LACTOMETERS for trying the quality of Milk: four tubes in frame, 6s. each. Wasp Traps, 3s. per dozen. Stands for Pianofortes, 9d. each.

MILK PANS 2s. to 6s. each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Pastry Slabs; Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

N.B. The moderate charge of 1s. for each packing case will be made, which we think will be an inducement for parties to retain them; but if sent back free of expense the whole will be allowed.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

SMITHFIELD CATTLE SHOW.—MILK PANS, in stout Glass, of every size and variety of shape, were exhibited as usual, Nos. 148, 149, 150, Bazaar, by Messrs. Cogan and Co., whose collections were honoured (among other Prizes) with the Silver Medal of the Dublin Society in April, as also with the Silver Medal of the Liverpool and Manchester Society, at their meeting, held at Warrington in September last.

NOBLEMEN, FARMERS, and the Public generally, are respectfully invited to notice the NEW GLASS CHURN. LORD CAMOY'S MILK SYPHONS for separating Milk from Cream, GLASS LACTOMETERS for ascertaining the quality of Milk, New Bee Glasses invented by Lord Keane, Glass Cream Pots and Pans, Glass Milk Trays, Glass Tiles and Slates, and every description of Dairy Glass.

Durable Farm Paints, Glass for Hothouses and Garden purposes, may be had (safely packed) for any part of the kingdom, or for exportation, on application at the Stands, 148, 149, and 150, or at the Warehouse, 48, Leicester Square, London.

Small Glass for Melon Pits of every size, from 10s. 6d. per 100 feet; Hartley's and Swinburne's PATENT ROUGH PLATE at the Manufacturer's prices,

Glass Ornamental Shades, Fern Shades, Lamp and Gas Glasses, Patent Glass Pens; Patent Texturalized, Silicated Marble, and other Ornamental Glass, supplied, as usual, at 48, Leicester-square; the Colour and Lead Department, at 5, Prince's-street, Coventry-street, London.

TO MARKET GARDENERS AND NURSERYMEN.

TO BE SOLD OR LET, on very low terms, "THE GARDENS" at Newmarket, formerly belonging to the late "Crockford Esquire," and stocked with the choicest varieties of Fruit Trees regardless of expense. They contain 4 acres of the richest garden soil, sloping to a southern aspect, walled in on all sides, and include a Gardener's House and Yard, an extensive Vinery 160 feet in length, containing 3000 feet of glass, and replete with the best varieties of Frontignan, Muscat, Hamburgh, Muscadine, and other equally excellent kinds of Grapes in first-rate bearing condition. A second Vinery, 45 feet in length, equally well stocked with choice Grapes, and contains 1000 feet of glass. A third Vinery, 45 feet in length, stocked with Vines as others, together with a large quantity of hard and soft-wooded plants, and containing 1300 feet of glass. The whole are provided with Potting and Store Houses, and are heated on an approved plan. There is also a range of 15 light Melon and Cucumber frames, and another of 12 light do. Any quantity of Land will be let with the Gardens for Nursery purposes.

The Gardens are situated close to the Newmarket and London Railway, equidistant 13 miles from the populous towns of Cambridge, Bury and Ely, and afford an excellent opening to any one desirous of meeting with a first-rate Market Garden and Nursery Grounds.—For Terms, apply to Mr. J. F. Clark, Architect, Newmarket.

FARM WANTED AT MICHAELMAS NEXT.—Wanted to Rent, by an active and experienced Agriculturist of Devonshire, of 45 years of age, from 300 to 500 acres of good sound Land, in any County. The nearer London, the better it would be preferred, and near a railway station. The Advertiser is a man of good capital, having several Farms of his own, and is now living in one of them, where he has always lived, and his father before him. He also would take a situation as Land Steward if desired.—Direct to A. B., Post-office, Moreton Hamstead, near Exeter.

P.S.—To view, half the second class travelling expenses paid.

CHRISTMAS HOLIDAYS.

THE GARDENS OF THE ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY except Sunday, from Christmas Eve to January 6th inclusive

The HIPPOPOTAMUS is exhibited from 11 to 4 o'clock.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—Freeman Roe and Hanson, Hydraulic and Gas Engineers: Office, 70, Strand, London.

METCALFE and Co's NEW PATENT TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe, Bingley, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

Caution.—Beware of the words "From Metcalfe's," adopted by some houses.

CAUTION.

NIGHT LIGHTS.—PATENT ALBERT NIGHT LIGHTS (Patented 30th January, 1844), CHILDS' NIGHT LIGHTS (Registered 20th September, 1843) are sold by all Grocers and Wax Chandlers throughout the country, at 6d. per box. The sale of the above, amounting at the present time to many tons weekly, shows that they meet with the approbation of the public; any description of them is therefore unnecessary. The object of this advertisement is, to request purchasers to *examine the name on the boxes*, so as to insure their getting what they intend.

Night Lights are liable not to last the time that they profess (frequently going out an hour or two after lighting); to be affected by the temperature of the room they are burnt in; to be injured by keeping any length of time, and to have an unpleasant smell. The manufacturers consider that, by use of materials secured to them by several patents, and by long experience in the manufacture, that they have overcome these difficulties; and they therefore beg, that should any attempted substitutes be recommended, they may be carefully compared as to all the above particulars.

N.B.—The wine-glass-shaped Lamp, on which is stamped "Clarke's Patent," is that recommended for the Albert Lights.

Price's Patent Candle Company, Belmont, Vauxhall.

APPETITE AND DIGESTION IMPROVED.

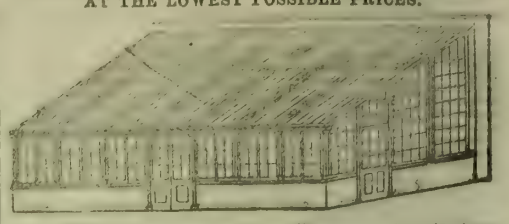
LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, Lea and Perrins, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "Lea and Perrins" are upon the label and patent cap of the bottle.

TO LANDED PROPRIETORS.—WOOD AGENCY.



JAMES MATHIES, Forester, is at liberty to superintend or report upon such improvements or valuations of Wood as he may be honoured with; and trusts, from his knowledge of the suitableness of soils and situations for the healthy growth of Forest Trees, his extensive practice in Planting, Thinning, Pruning, Draining, Valuations, &c., he will be enabled to give satisfaction as a general Wood Agent, especially by the adoption of a practical, economical, and natural cultivation.—J. M. has been employed upon the Estates of Sir William Worsley, Bart., Hovingham Hall, Yorkshire, for the last 20 years as his Woodman, and is kindly permitted to refer to him.—Terms Moderate

Communications may be addressed to James Mathies, Forester, Craigs, Stirling.

N.B.—Workmen carefully instructed.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 34, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of John Willis accompanies each packet.

SEASONABLE PRESENTS.—At this festive period of the year, friends and lovers are more than usually desirous of shining in PERSONAL ATTRACTION, and the following unrivalled discoveries for the Toilet are called into increased requisition, namely—

ROWLANDS' MACASSAR OIL,

for creating and sustaining a luxuriant head of hair;

ROWLANDS' KALYDOR,

for rendering the Skin soft, fair, and blooming; and

ROWLAND'S ODONTO,

OR PEARL DENTIFRICE,

for imparting a pearl-like whiteness to the Teeth.

The patronage of Royalty throughout Europe, and the high appreciation by Rank and Fashion, with the well-known infallible efficacy of these articles, give them a celebrity unparalleled, and render them a peculiarly

ELEGANT AND SEASONABLE PRESENT.

Beware of Spurious Imitations.—The only Genuine of each bears the name of "ROWLANDS'" preceding that of the article on the wrapper or label, with their signature at the foot, in *red ink*, thus—

A. ROWLAND AND SONS.

Sold by them at 20, Hatton-garden, London; and by respectable Chemists and Perfumers.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

The Gardeners' Chronicle.

		{ Medical	8 P.M.

In DE CANDOLLE'S Vegetable Physiology an attempt is made to show, by the examination of various aged trees, that the rate of formation of TIMBER diminishes rapidly after a given period, varying with the species, but tolerably limited in each species; from which it might be inferred that it is more profitable to fell it at the time when decrease commences, than to let it stand to a later period. In a country like England this is, or at least has been, so much a question affecting the value of landed property that it might have been expected to have met with a strict examination. Nevertheless the statement to which we allude, made about 18 years since, remains to this day, as far as we know, uninvestigated: and yet what more important? for if DE CANDOLLE'S results were exact, it is clear that timber should be felled while still comparatively young; or if inexact the practice would be attended with great loss. It is in the hope that some inquiry may now at least be made into the matter, that we draw attention to the subject.

The French physiologist assumed that the age of an European forest tree could be determined by the number of its rings of wood; an assumption which, although not strictly true, may nevertheless be taken as sufficiently exact for common purposes. Examining by this rule such old trees as he met with, he was led to infer that the period of quickest growth in the Oak lasted 60 years, followed by another period when the growth is slower but more regular. In the Larch the vigour of growth appeared to diminish after 40 years, the Elm after 50 years, the Beech after 30 years, the Spruce Fir after 40 years, the Yew after 60 years. This resulted from a comparison of the rate of increase in semi-diameter every 10 years, in the following and other cases. For example:

Oak A, aged 98 *years,* grew thus: in the first 10 years 4 lines; in the second 10 years 3 lines; then $3\frac{1}{2}$, 6, 7, $7\frac{1}{4}$, $6\frac{3}{4}$, $7\frac{1}{4}$, 8, 7, 6.

Oak B, aged 130 *years:* 27, 31, 27, 30, 24, 22, 28, 22, 16, 16, 15, 16, 15.

Oak C, aged 210 *years:* 5, 8, $11\frac{1}{2}$, 6, $6\frac{3}{4}$, 7, $5\frac{1}{2}$, $5\frac{1}{2}$, $4\frac{3}{4}$, $4\frac{3}{4}$, $4\frac{3}{4}$, $4\frac{1}{2}$, $4\frac{1}{2}$, $4\frac{3}{4}$, 5, $4\frac{1}{4}$, $4\frac{1}{2}$, 5, $4\frac{1}{2}$, $4\frac{1}{2}$, $4\frac{1}{2}$.

Larch, aged 255 *years:* 24, $30\frac{1}{2}$, 29, 36, 23, $28\frac{1}{2}$, 23, $14\frac{1}{4}$, 15, 12, 16, 13, $10\frac{1}{4}$, 11, $11\frac{1}{2}$, $10\frac{1}{2}$, 10, $9\frac{1}{2}$, 9, $10\frac{1}{2}$, 11, $11\frac{1}{4}$, $10\frac{1}{2}$, 11, $10\frac{1}{4}$.

Elm, aged 335 *years:* 8, 22, $29\frac{1}{4}$, 36, 44, 37, $39\frac{1}{4}$, 33, $29\frac{1}{2}$, $22\frac{1}{2}$, 15, 15, 12, 12, 9, $9\frac{1}{2}$, $8\frac{3}{4}$, $11\frac{1}{2}$, 15, 17, 17, 13, 18, 14, 13, 12, $8\frac{3}{4}$, 13, 14, $14\frac{1}{2}$, 8, $8\frac{1}{4}$, $10\frac{1}{2}$.

Beech, aged 48 *years:* 8, $6\frac{1}{2}$, $7\frac{1}{4}$, 5, 5.

Spruce Fir, aged 130 *years:* $20\frac{1}{2}$, 27, 26, $22\frac{1}{2}$, $7\frac{3}{4}$, 18, 9, $8\frac{1}{2}$, $6\frac{1}{2}$, $6\frac{1}{2}$, 11, 11.

Yew, aged 74 *years:* 4, $5\frac{3}{4}$, 6, $5\frac{1}{4}$, $3\frac{1}{2}$, $6\frac{1}{4}$, 4.

We quote these numbers rather for the purpose of showing on what kind of evidence DE CANDOLLE'S speculation was founded, than because we think they support his view. On the contrary, they are far too few in number to deserve much attention; and they do not in fact always confirm his opinion; but he intimates that, taken with other evidence, they do seem to confirm it.

Yet he himself suggests that the diminution which he found in the rate of growth might be owing to exterior causes, and not to any decay in the vital forces of the trees; and, among other things, he remarks that variable rates of increase may depend upon whether the roots meet with good or bad soil as they advance, or perhaps whether they grow more freely in consequence of being rid of neighbouring trees.

We have already said that this question remains without an English answer. To a certain extent it has been replied to by Messrs. BRAVAIS and MARTINS. These philosophers give the following as the result of their examination of the rate of growth of the Scotch Fir in different localities; partly derived from personal examination of numerous examples, and partly from information communicated to them.

PLACE.	No. of cases examined.	MEAN THICKNESSES OF THE ANNUAL LAYERS.

Haguenau (Lower Rhine)	30	3.28	3.19	1.80?					

This seems not merely to confirm DE CANDOLLE'S theory of gradual decrease in vigour, after a certain age, but to give it additional probability; for every succeeding 50 years exhibits a lower rate of growth than took place in the previous 50 years. It is true, according to BRAVAIS and MARTINS, that in all these cases one year may indicate a quicker growth than the preceding one; but such anomalies disappear when we take the mean of a great number of years—the only admissible manner of stating such cases. But in all probability a fallacy lurks under these results, such as was suggested by DE CANDOLLE; for in another place (Annales des Sciences III., ser. 3, p. 373) these authors refer the progressive diminution of growth to the interlacing of the Fir roots, which gradually exhaust the soil in which they grow.

When trees grow singly, unaffected by neighbouring trees, age seems to bring no diminution in vigour, as is shown in the following table of Oak-growth at Geffle, the mean northern limit of the tree in Scandinavia.

The columns of the following Table contain the age of the tree, the length of the radius, the thicknesses of each set of 25 layers, reckoned from the centre to the circumference. The ends of the radii, containing less than 25 layers, are indicated by the prefix + and their length for each period is placed in the line, headed "Additional increase."

Here it is seen that Oaks of considerable age showed, even in a bad climate, no sign of decrepitude, except No. 4, the centre of which had begun to decay. And that signs of decrepitude are attributable, in the Oak, to external rather than constitutional causes, seems proved by some observations of M. POIRSON, inspector of royal forests in France, who furnished BRAVAIS and MARTINS with the following statement of the average of growth of Oaks in the forest of Compiègne:—

OAKS MEASURED IN THE FOREST OF COMPIEGNE.
Lat. 49° 25′ N., Long. 0° 30′ E.
THICKNESS OF THE LAYERS, IN MILLIMETRES, EVERY 25 YEARS.

0–25	25–50	50–75	75–100	100–125	125–150	150–175	175–200
82.0	46.0	45.0	64.0	58.0	70.0	20.0	12.5

This table shows, as the authors observe, that the formation of timber in the Oak has no uniformity like that of the single Oaks at Geffle. "At the age of 30 years, vegetation languished; it recovered at about 80, diminished again at the end of a century, to be renewed at the age of 130; but after 150 years, it declined rapidly, up to 200 years. So that there were three maxima and three minima in the life of these trees. M. POIRSON reckons, among the causes of such alterations, the clearings that were made around the trees that were left. Thus a hard-wooded tree which has been choked up in its youth, by fast-growing white-wooded short-lived trees, and which, after their disappearance, takes up the space they occupied, will vary in its rate of growth, according to the confinement or freedom in which it has been successively placed. A tree cooped up in a clump for a certain number of years, will gain in bulk only the fourth or the eighth of what it would have acquired, if left at perfect liberty."

On the other hand the Ash seems really to decline at the end of 75 years. M. POIRSON furnished BRAVAIS and MARTINS with the following rate of growth of an Ash tree at Compiègne, uprooted in the wet soil of the summit of a sugar-loaf hill on the Côte Saint Pierre.

ASH MEASURED AT COMPIEGNE.
Lat. 49° 25′ N., Long. 0° 30′ E.
THICKNESS OF LAYERS, IN MILLIMETRES, EVERY 25 YEARS.

0–25	25–50	50–75	75–100	100–125	125–150	150–175	175–200
88.0	98.0	106.0	48.0	12.5	25.0	20.0	8.0

This is so like what was found to be the fact with some Ash trees examined by the above mentioned authors, near Upsal, that the two cases seem to point to a common law.

ASH TREES MEASURED AT UPSAL.—Lat. 59° 62′ N., Long. 15° 19′ E.

In these instances, BRAVAIS and MARTINS remark that the trees grew up to 50 years at a gradually increasing rate; and then quite as rapidly declined.

Such are the best facts with which we are acquainted concerning the rate of growth in forest trees; and we lay them before our readers in the

hope that they will excite the attention which they certainly merit, especially since they show how far we are from having any sufficient evidence concerning one of the most important questions in the art of foresting.

The manner in which cold acts upon plants is one of the problems which have never yet been solved, and probably never will be. We see its effects, but all attempts at investigating their causes have proved eminently unsuccessful. That a low temperature, or frost, acts differently upon different plants very nearly allied to each other is notorious; and this even where they are mere varieties of each other. The China Rose, for instance, resists any amount of English cold; the variety called the Tea-scented perishes, or suffers severely, in every ordinary winter. The gay-flowered Senecios of the Canaries, known in gardens under the name of Cinerarias, shrink from the mere approach of frost, and perish upon its first arrival; yet the Ragworts and Mugworts, and Groundsels, all equally Senecios, can bear a Russian winter. In like manner Oaks, Chestnuts, Conifers, exhibit similar differences in their power of resisting frost. How to account for this is the question.

It has been suggested that the fluids contained in different species of plants may themselves act differently in the presence of cold; just as oil of turpentine requires a temperature of 14° to freeze, while oil of Bergamot freezes at 23°, and Olive oil at 36°. But although this may be true to a limited extent, yet it by no means explains the phenomenon in question. The plant *x*, for instance, perishes from frost, while another, identical with it in nature, lives with impunity within 2 yards of it, both having been exposed to the same temperature. In this case the fluids of the two will be chemically the same, and yet the results are opposite. Again, the Long-leaved Pine (*P. longifolia*) is quite tender, while the Gerard Pine, exceedingly like it, is hardy; in this case there is no ground for supposing that the fluids contained in these species are different. In fact, except that all plants suffer from cold in proportion to the quantity of water they contain, we have no kind of evidence to show that the quality of their fluids has any material influence upon their power of resisting cold; for it is by no means true, as some too hastily assert, that resinous trees, like Conifers, are rendered hardy by the resin they contain; the Norfolk Island Pine, and the Malay Dammar are tender, although both resinous and Coniferous.

In this, as in so many other horticultural questions, the difficulty of the subject vanishes when we desist from a vain search after undiscoverables. It is by attempting to explain every phenomenon of life by the known laws of chemistry, electricity, and similar agencies, that we plunge into a labyrinth of perplexity—

"And find no end, in wandering mazes lost."

But the moment we admit the presence everywhere among plants of a *vital principle*, or of *vitality*, and thus recognise a direct analogy between plants and animals, the principle of life in the two kingdoms being identical, but differently manifested, then we tread on the firm ground consolidated by the march of ages, and find, in the experience of animal physiology, the elucidation of what is obscure in that of vegetables. It is true that we then abandon the pursuit of first causes, and confess the vanity of that curiosity which nothing can satisfy; but we exchange rationalism for materialism, and we learn how to apply experience to daily uses.

It is an axiom in animal physiology, that "the general effect of cold on living bodies, is a diminution of vital activity, which terminates, if the cold be intense, and its application continued, in death." (*Pereira.*) Hence it is to be inferred, that all living things whatsoever must finally perish beneath the influence of cold, provided it is severe enough, and prolonged enough. But living things have each their separate constitutional vitality, the power of which in resisting cold differs between species and species, or variety and variety, and even between individual and individual. It is a peculiarity derived from the great source of all things; a reality; inexplicable but indisputable; like light, and heat, and electricity. We see it manifested among plants between the yellow and the spider Ophrys, and the Tea Rose and the China Rose; as among animals between the ass and the zebra, the Negro and the Esquimaux, the terrier and the Italian greyhound. The moment we admit this principle, the mode of dealing with cold in gardens becomes analogous to that which experience tells us is effectual in the animal world. When a man is frozen, if he is suddenly thawed, he dies, or his limbs drop off; and so of frozen plants; nothing brings them such certain death as a sudden elevation of temperature. When the French retreated from Moscow, frozen noses and limbs were common, but immediate rubbing them *with snow* removed the tendency to congelation, and hence it became a practice for the unhappy men to look narrowly after each others noses; for each could see his neighbour's, although he could neither feel nor see his own. As long ago as the days of Hippocrates it was known that a man who had had his feet frozen, lost them if plunged into warm water. It is exactly the same among plants; it is certain that a frozen plant, though tender, will not perish if it is gradually thawed, by being watered plentifully with cold water. Thus early Peas, Kidney Beans, and the like, are often saved by merely giving them a good watering the first thing in the morning before the sun is on them. It is asserted, and we doubt not with perfect truth, that wall trees, whose blossoms have been frozen, have had their crop saved by copiously syringing before sunrise.

In all these cases it is, however, indispensable that the artificial thawing be practised before the solar rays can fall upon the object frozen; the sudden elevation of temperature necessarily produced by morning sunbeams, renders all after applications useless. And hence it is that the need of artificial thawing is altogether removed by planting tender things at the back of north or west walls, or behind screens. In such situations, sudden changes of temperature will not occur; but the natural thawing must of necessity be very gradual. An instructive example of this is now before us. In the summer of 1849, an evergreen New Zealand Beech, well known to be tender, was planted experimentally on the north of a ruined wall. In the succeeding winter it was remarked that the upper part of it was not screened from the sun; but about three-fourths of it next the ground was perfectly screened. On the approach of spring it was found that the part exposed to the sun was killed to the level of the wall; while the parts below the level were unchanged even in colour. The plant grew vigorously in 1850, and remains where it was originally planted, and we have no doubt will undergo the same fate as before. When we add this to the cases of Fuchsias, Camellias, Tree Pæonies, &c., now becoming so generally well known, it seems impossible to doubt that, the vitality of plants and animals being the same, the same methods of treatment which are known to be requisite in the one case are equally effectual in the other. Let us hope that this great truth will not be forgotten by any of our readers during the winter and cold spring that lie before us.

ON MAKING AND CONCRETING VINE BORDERS.

I have been much interested in reading Mr. Spencer's excellent remarks, at p. 772, on this subject; and having made two borders for early Vineries here, eight years ago, very similar in principle to those now recommended by Mr. Spencer, I am led to imagine that a brief account of my experience in the matter may possibly prove acceptable to some of your readers.

The old border, which was fully 4½ feet deep, without drainage, its soil rich, heavy, and very adhesive, was cleared out altogether, shaping the sub-soil (a mixture of clay and limestone), so as to slope well from the houses. We began forming the new border by building two loose dry stone walls (without mortar) from 9 to 12 inches wide; one close along the side of the front wall of the houses, and rising to within a few inches of the ground level, the other along the opposite, or south side of the border, and rising quite to the ground level, side drainage, and the admittance of air to the under part of the border, were the object of these walls, which extended the entire length of the border. The next step was filling up between the walls. This was effected by placing, as loosely as possible, very large stones in such a way as to form innumerable cavities, large enough for a good-sized dog to traverse the drainage in all directions. A depth of 2 feet of these larger stones was covered by 6 inches of smaller stones, lessening in size, as the top of the drainage was approached, which was nothing more than *clean* very coarse gravel; on this was put a layer of sandy loam turfs, the grassy side downwards. And then we wheeled in the compost, which consisted of two-thirds poor sandy loam, obtained in very thick turfs, from a paddock, and one-third of lime rubble, leaf soil, and rotten cow-dung, in about equal parts. The whole had been roughly chopped, and well mixed together a few weeks only before using it. When about half the compost had been wheeled into the border, we strewed on it some three or four bushels of unbroken bones, of various sizes, which were covered with another foot of soil, and the border was finished, its entire depth being 4½ feet—*i. e.*, 2 feet of soil, and 2½ feet of drainage.

The young Vines, which were planted in May, grew with great vigour. We took a slight crop from them the second year after planting, and every year since they have produced an increasing quantity of Grapes.

In forcing the Vines, my practice, until last season, was to cover the border with from 12 to 18 inches of leaves, adding a little long dung on the top, in order to prevent the leaves from being blown away; but this covering was never very satisfactory, owing to our inability to keep a steady, continuous heat in it; and on examining the border, during the forcing season, I have often been surprized at its wetness, though drained, bottom and sides made of very loose materials, and only 2 feet deep in soil. It was evident, two years ago, that its texture was every year becoming more adhesive and unsatisfactory, and, on seeing Mr. Fleming's mode of concreting the surface, as detailed in the *Chronicle* of last year, I was led to adopt it on the border of the largest and earliest forced of the two houses. I put the concrete on in September, 1849, and after it became dry and hard, covered it with a few inches of litter, as a protection from frost. This was the only covering the border had all through the season. I regarded it as an experiment, and it proved a successful one; for, last season, we cut, from this house, the heaviest crop of the best and blackest Grapes the Vines have ever produced, and the new wood for the coming year is strong and well ripened. In putting on the concrete, provision was made for subsequent watering; and during the last swelling of the Grapes, the border received two rather copious waterings with weak liquid manure, and also two more during the summer months, after the Grapes were cut. I have lately examined the soil under the concrete, in different parts, and find it in good condition. We are just now starting the Vines, with every prospect of success; and should another season's experience prove as favourable for concreting as that of the past has done, I purpose extending it to the border of the other early Vinery. In our late houses I do not think it necessary, though in very low wet localities it may possibly be useful. *William Loader, gardener at Blaise Castle, near Bristol, December* 16.

BRITISH SONG BIRDS.

No. XI.—Having now made a somewhat formidable collection of the feathered tribe, say about 100, and confined them all in one room—it behoves us to pay marked attention to their peculiarities and habits; the more so, as perhaps in the first instance, no two of them will be found alike in disposition. By studying their likes and dislikes, there will be little difficulty in making them a "united happy family." If any "incorrigible varlet" appears among them, out with him at once, by way of "example."

We may get a good hint or two on the subject of colonisation from the "Happy Families" confined in large locomotive cages, which are now being exhibited in three different quarters of London, daily.

In these cages, we find living together in perfect amity—cats, mice, rats, pigeons, crows, sparrows, hawks, owls, starlings, ferrets, monkeys, rabbits, weazels, young foxes, and leverets; *cum multis aliis*. The extreme natural opposites seem, in all these animals, to have become annihilated. Thus, we see the sparrow and the hawk doing the loving and the amiable with the most sympathetic affection; the rat revelling luxuriously in the warm embraces of Grimalkin; the ferret and weazel frolicking with the rabbit; the monkey carefully handling the pigeon's eggs, as he replaces them (after first satiating his prying curiosity), under the sitting mother; and, among other eccentricities, the leveret "polk"-ing with the fox.

I am not at this moment prepared—but I hope ere long to be so—to state "how" this naturally-savage colony has been brought to so complete a state of civilisation. There is no doubt that the "eye" of the master is the great talisman; for it visibly acts as an all-powerful agent on the nerves of every one of the animals. They understand, beyond all dispute, and with a very little drilling, *what* is intended by their master's movements, and peculiar expression of countenance; for they instantly obey him. I believe "the stick" *is*, on some occasions, introduced in the background. "It enters," no doubt, "into combination" with the other "effects;" but I never tried it.

The next grand step, with a view to establish harmony in the colony, is to see that each and every animal has, provided for it, its own natural food. If the pangs of hunger were to come on cruelly sharp, and the hour of breakfast, dinner, and supper, were to be lost sight of, and the regular supplies stopped,—we should have a realisation of the old nursery tale, "The cat began to eat the rat—the rat began, &c. &c." A few hours, or less, would devastate the colony. I can almost imagine I hear the bones of the bounding leveret being crunched beneath the jaws of the salacious fox.

Speaking of the leveret, it is worthy of remark that this animal, being *feræ naturæ*, is one of the most difficult to tame, permanently, of all creatures. The late Sir John Sebright called on me, some years ago, to see my collection of Robins, of which he had heard so much; and during a lengthened conversation of great interest to both of us, he put me in possession of many singular facts with respect to animals "by nature wild." To mention only two:—Sir John told me he had procured some eggs of the wild duck, and placed them under a domestic hen. They were hatched in due course, fed, and brought up with the other chickens, ducks, &c., in the poultry-yard. Still, they gave early signs of the wildness of their nature. They were "pinioned," and thus made "apparently" tame; but when the wing-feathers reappeared, the birds one day, on a slight alarm, took flight, and disappeared altogether.

The second instance of natural wildness being indomitable, presented itself in the case of some half-dozen wild rabbits, taken from the nest soon after they were kindled. Sir John lavished on them much of his attention; tried every means to tame them; all in vain. The animals gave early evidence of the instinct of their

nature, and were ultimately let loose to run riot in a warren.

I have been led to pursue this discussion, in order to show how necessary it is to study the habits and dispositions of all birds domiciled in an aviary. This brings us to the grand and all-important question of Proper Food. *William Kidd, New-road, Hammersmith.*

VILLA AND SUBURBAN GARDENING.

WHETHER should Pears be planted as Espaliers or as standards? This is a very important question, and one not sufficiently considered even by good gardeners. The French are more politic; where standards are planted they take measures to secure them against the effects of violent winds. Such fruits, for example, as Duchesse d'Angoulême and Beurré Diel have no chance on standards of maintaining their hold during a heavy gale, consequently, they get blown down at the very period when of all others it is most important for their perfect maturity that they should remain upon the trees. Autumn gales are uncertain as to the period of their arrival, but we never escape them; and hence the necessity of guarding against them. How often do we not find Pears condemned as gritty, tasteless, and sugarless, when the variety is not at fault at all, but when the evil lies in the treatment they have received. Such is most frequently the case with the larger kinds, which will hang on the trees very well when the branches are perfectly secured, but which are not able to sustain their position during high winds, when the boughs are at liberty to be blown about. On this account experience is decidedly against planting heavy Pears as standards, unless the whole tree is firmly fastened, and numerous schemes have been suggested for this purpose. The French use a central stake of wood or iron the height of the tree; they then fasten strong wire to the top, bringing it out at the bottom, and securing it to the ground at five or six points, and at a similar distance from the bole of the tree, so as to cause it to exhibit the appearance of a cone. Wires are then fastened to the centre stake and brought out to the exterior lines of wire in a horizontal direction, as the branches may indicate. The latter are then firmly tied to these horizontal lines. It will be observed that the power of resistance is equal to the force of pressure from whatever point the latter may come, and the numerous ligatures employed in fastening the branches in every part, protect the whole tree in the most perfect manner. I have also observed large and fine specimens of fruit secured individually. The French place more value upon Pears than we usually do. Their Pears are thinned with as much exactness as we employ in regard to our Peaches, consequently their specimens are much finer, and the flavour is superior; but the latter is no doubt in some measure attributable to the climate. They do not permit their trees to grow into a thicket, consequently sun and air can penetrate every part, a matter worth the attention of gardeners who live in less sunny climes. *Pharo.*

NOTES OF A TRAVELLER.—No. XIV.

MOUTAN GARDENS, NEAR SHANGHAE.— Leaving the south garden described in my last letter, I walked onwards to the Moutan Nurseries. They are situated near the village of Fa-who, about 5 or 6 miles west of Shanghae, and in the midst of an extensive Cotton country. On the road I met a number of Coolies, each carrying two baskets filled with Moutans in full flower, which were on their way to the markets for sale. When I reached the gardens I found many of the plants in full bloom, and certainly extremely handsome. The purple and lilac-coloured kinds were particularly striking. One, a very dwarf kind, and apparently a distinct species, had finely cut leaves, and flowers of a dark velvety purple, like the Tuscany Rose of our gardens. This the Chinese call the "black" Moutan, and I believe it is the same which Dr. Lindley has described in the Journal of the Horticultural Society, and named P. atrosanguinea. Another kind called the "tse," or purple, has double flowers of a large size: this is probably the variety reported to have 1000 petals, and which is said to exist only in the garden of the Emperor. The third is called the "lan," or blue: this is a lilac variety, with flowers of the colour of Glycine sinensis. There are others of various shades of purple, perfectly distinct from these, and equally fine.

The double whites are also numerous and handsome. The largest of these Dr. Lindley has named P. globosa, but there are four or five others nearly as large and double. Some of them have a slight lilac tinge, which gives a richness to the colour. The most expensive is one called "wang," or yellow, by the Chinese: it is a straw-coloured variety, rather pretty, but not so handsome as some of the others.

The reds (Hong) are also numerous. Curious enough, those kinds which are common in Canton and England are rare here. There are about half-a-dozen of new varieties of reds in these gardens: one of them, called "Van-yang-hong" by the Chinese, is the finest flower I ever saw. The flowers are of a clear red colour, unlike any of the others, perfectly double, and each measures about 10 inches across. Altogether I numbered about 30 distinct varieties in these gardens.

Nearly all these fine varieties of the Moutan are quite unknown in Canton. This may seem strange in a country where the people are proverbially fond of flowers, but the Chinese are so machine-like in all their movements, that after a little acquaintance with them, we cease to wonder at the apparent anomaly. The fact is, the Canton gardens are supplied with Moutans by another district, which lies much further to the west than Shanghae. From time immemorial the same gardens have supplied these flowers; they came always by the same road and at the same time of the year. Shanghae, until the close of the last war, never seems to have had any connection with Canton, in so far as flowers were concerned, consequently these fine varieties of the tree Pæony never found their way to the south and from thence to Europe.

The Moutan gardens are numerous, but each is upon a very small scale. They look more like cottage gardens than anything else, and are managed in the same way as gardens of this description generally are, namely, by the members of the family. The female part of the community seem to take as much interest in the business as the males, and are very avaricious and fond of money. I invariably found I had to pay higher prices for the plants when they were consulted on the matter. The soil of these gardens is a rich loam, well manured, and thus rendered lighter in texture than that of the surrounding country in which the Cotton grows.

The propagation and management of the Moutan seems to be perfectly understood by the Chinese at Shanghae, much better than it is in England. Our nurserymen always complain that they cannot propagate it with facility, and consequently this fine flower is invariably high in price. I will tell you how the Chinese manage the business, in order that your nursery readers may give the system a trial.

In the beginning of October large quantities of the roots of a herbaceous Pæony* are seen heaped up in sheds and other outhouses, and are intended to be used as stocks for the Moutan. The bundle of tubers which forms the root of a herbaceous Pæony is pulled to pieces, and each of the finger-like rootlets forms a stock upon which the Moutan is destined to be grafted. Having thrown a large number of these rootlets upon the potting bench, the scions are then brought from the plants which it is desirable to increase. Each scion used is not more than 1½ inch or 2 inches in length, and is the point of a shoot formed during the bygone summer. Its base is cut in the form of a wedge, and inserted in the crown of the finger-like tuber just noticed. This is tied up or clayed round in the usual way, and the operation is completed. When a large number of plants have been prepared in this manner they are taken to the nursery, where they are planted in rows about a foot and a half apart, and the same distance between the rows. In planting, the bud or point of the scion is the only part which is left above ground; the point between the stock and scion, where the union is destined to take place, is always buried beneath the surface. Kæmpfer states that the Chinese propagate the Moutan by budding; but this must have been a mistake, as budding is never practised in the country, and is not understood. He was probably deceived by the small portion of scion which is employed, and which generally has only a single bud at its apex.

Many thousands of plants are grafted in this manner every autumn, and the few vacant spaces which one sees in the rows attests the success which attends the system; indeed it is rare that a graft fails to grow. In about a fortnight the union between the root and the scion is complete, and in the following spring the plants are well-established and strong. They frequently bloom the first spring, and are rarely later than the second, when they are dug up and taken to the markets for sale in the manner I have described. When each has only one stem and one flower bud, it is of more value in the eyes of the Shanghae nurseryman than when it becomes larger. In this state it is more saleable, it produces a very large flower, and it is easily dug up and carried to the market. I could always buy large plants at a cheaper rate than small ones, owing to these circumstances.

In the gardens of the Mandarins it is not unusual to meet with the tree Pæony of great size. There was one plant near Shanghae which produced between 300 and 400 blooms every year. The proprietor was as careful of it as the Tulip fancier is of his bed of Tulips. When in bloom it was carefully shaded from the bright rays of the sun by a canvas awning, and a seat was placed in front on which the visitor could sit down and enjoy the sight of its gorgeous flowers. On this seat the old gentleman himself used to sit for hours every day, smoking pipe after pipe of tobacco, and drinking cup after cup of tea, while all the time he was gazing on the beauties of his favourite "Moutan wha." It was certainly a noble plant, and well worthy of the old man's admiration; long may he live to sit under his awning and enjoy such a sight. *R. F.*

* A variety with small single flowers.

Home Correspondence.

Epiphyllum truncatum and its varieties. — I consider that these ought to be brought more into notice than they are at present. If we take into consideration their time of flowering, along with the beauty of the blossoms and the graceful appearance of the plants, we must come to the conclusion that, as a whole, we have little to equal them during the dark days of winter. What have we better for decorating our conservatories and drawing-rooms throughout November, December, and January? By exciting some, and retarding others, I can have a prolongation of bloom during these comparatively flowerless months. But, alas! how often do we meet with plants, all but annihilated with scarcely a leg to stand upon except a wooden one, of a pale sickly appearance, either soddened with water, or starved for pot-room, pent up in a dark corner of a stove or forcing-house, when they ought to be in the open air ripening their wood for a future display of flowers. The method I adopt to insure success, as regards their treatment, is as follows: I grow none on their own bottoms; they are all grafted on Cereus speciosissimus, which I consider a better stock than Pereskia aculeata, as the grafts are not so liable to be outgrown by the stock on the former as on the latter. Select some clean healthy plants that have been struck from cuttings the previous year for stocks. In March introduce them into a stove or pit where there is a heat of from 50° to 70°. When they show signs of growing, with a sharp knife make incisions in the angles alternately all round from 4 to 6 inches apart, and place one graft on the top, fastening it with a spine of the stock, and proceed in the same manner with the sides. I prefer the grafts from one-year-old shoots, they require nothing farther than shading, and keeping rather close for a month or six weeks. In the course of two months they will begin to show signs of growing, then give them more air and light, and keep the stocks divested of all suckers as they appear. As regards height, they may be from 1 foot to 6, that all depends upon taste and convenience. A plant grafted 1 foot high will form a handsome bush, 2 or 3 feet across, hanging over the sides of the pot, and supported with a wire trellis underneath; cylindrical trellises are the best for showing tall plants to advantage. As regards culture, presuming the plants have done flowering, and are stored away on a shelf in the greenhouse, or any other convenient place, free from damp, and kept rather dry at the roots, they will require nothing more till about the middle of March. Then they must be brought to the potting-shed and repotted; this operation requires to be performed very carefully, as the shoots are easily broken. The soil that I find best suited for them is, two parts decayed turf, one decomposed cow-dung, and one river sand, or, what is better, the grit that is washed by the rain on the sides of turnpike roads. These well incorporated, together with a little leaf-mould and some pieces of charcoal, make a suitable compost; the pots must be well drained, 3 inches at least for large plants. Then proceed to shift them very carefully, by rubbing part of the old mould away, and pressing the new rather firmly among the roots; readjust the trellises, and the work is completed. Afterwards place them in a gentle bottom heat, either in a stove or pit, and give a good watering, allowing the thermometer to range from 50° to 70°; giving them a syringe in the morning when there is an appearance of a fine day, and they will soon start into growth. Then, light, air, and moisture are beneficial to them at this stage, frequently turning the plants, so as to balance them on all sides; give manure water once a week when they are in a growing state, and regulate the young shoots; pinch some out where they are coming too numerously, in order that the plants may be equal on all sides. After they have made their growth, or towards the end of July, remove them to a greenhouse, or cold pit, for a short time, preparatory to placing them out of doors; withhold manure water at this stage, and keep them rather dry, in order that the wood may get thoroughly ripened; they will require protection from wind and rain; place them on coal ashes in a south aspect, at the bottom of a wall or hedge, till they have set their flower-buds. Towards the middle of September, remove them to a light airy place in the greenhouse, and introduce them into the stove or forcing-pit, in succession, as the demands of the family may require. I have proved by this management that there is no difficulty in getting them to bloom freely. By paying attention to a few minor points, as regards their rest and growth, they will more than amply repay the little labour bestowed upon them. Before the bloom expands, remove them to a cool place, in order to prolong it, and enrich its colour. *D. H., Cirencester.*

Vine Pillars.—I beg to call the attention of all who are incredulous of the success of Mr. Clement Hoare's pillars to the following fact related by Mr. Thomas Hitt, in his treatise on fruit trees, Chapter IV., page 10: "At Belvoir Castle, a seat belonging to his Grace the Duke of Rutland, there was a Vine which bore a white Muscadine Grape, growing out of the stony foundation of a wall, without any other roots than what were fixed therein; for the border was taken away from the wall many years before I saw it, and this Vine produced better fruit, and earlier ripe, than any of the same kind in these gardens, except those planted against the stove walls." Hitt on fruit trees is an old book,* and many may not have seen the extract I have taken from it. I took up a branch of a Vine this winter, which I had buried in the summer, and I found the branch had sent many roots into the wall's foundations. The Yew tree will grow upon a wall, the Mountain Ash will do the same; and as the Vine will do so, why should it not grow in Clement Hoare's composition, and in time do better than Vines out of doors in common circumstances, seeing the Belvoir Castle Vine did so under more trying conditions? *C. A. A. Lloyd.* P.S. Ash trees, Sycamore, Elder, and Witch Elm, are now growing upon the tops of the walls and towers of Whittington Castle. A Yew tree is growing out of the side of the wall of my coal yard, and a Mountain Ash on the top

* The title page stands thus:—A Treatise of Fruit Trees. By Thomas Hitt, Gardener to the Right Honourable Lord Robert Manners, at Bloxholm, in Lincolnshire. London: Printed for the Author, and sold by T. Osborne, in Gray's-Inn, 1755.

of a wall in my garden. Gooseberry and Currant trees will also grow upon the tops of walls. *Dec.* 23.

Fixed Filters in Wells.—Observing that you have referred a correspondent to my former communication on this subject, at p. 549 of the present year's volume, I am desirous to correct an error and to suggest two very material improvements on the apparatus there described, which an experience of its working effects during the last 6 months has afforded. The error alluded to relates to the effect of the filter on the taste of a strong chalybeate; probably the daily use of the water familiarising our palates with its flavour, may have created the belief that this was changed: be that as it may, it is certain that the filter I have employed has *not* had this imaginary effect, but it is by no means improbable that the taste, caused by the more oxidising of the iron contained in the mineral through which the water percolates, may be neutralised or improved by a filter composed of the proper chemical ingredients for this purpose. I should feel very much indebted to any one of your scientific correspondents who would communicate or suggest the materials of a filter by which so desirable an effect could be produced. The improvements I would suggest relate to the occasional cleansing, renewing, or changing the materials of the filter and of the well. By using the barrel (which was chosen simply as the implement most easily preserved for such experiments) it is difficult, if not impossible, from its shape and construction, to arrange the apparatus so as to allow the filter to be cleansed or changed without taking the whole out of the well, bodily—this would be a very cumbrous proceeding. It was also impossible to pump the water lower than the top of the filter, which would leave some five feet of water in the bottom of the well, unless some additional arrangement is made for this purpose. To effect the first of these objects, in place of a barrel it would be much better to use a square wooden box of the necessary dimensions, and having the filter to slide out and in on one side, like a drawer. Were it made so, the filter alone might be drawn out and then pulled up to be cleansed, removed, or changed at pleasure, leaving all the rest of the apparatus standing. This, however, it will be observed, could not be done without pumping the well dry, when it too might be cleaned. To effect the latter object, instead of carrying the pipe of the pump direct into the head of the barrel or box, without any joining, it would be necessary to cut the pipe a few inches above the top of the barrel. Each of the ends so cut must then be furnished with a screw or worm, over which a moveable coupling screw plays, similar to those used in coupling and uncoupling the flexible water-pipes of a locomotive engine with its tender. When these ends are disunited, a small hose of gutta percha tube, having a similar screw or worm at its upper end, and some holes, forming the snore of a pump at its lower end, could be attached to the pipe of the pump, and if of sufficient length to reach the bottom of the well, it will effectually and easily empty it whenever required. With these two small alterations I consider the apparatus to be in as effective a working state as it is susceptible of. If your correspondent wishes a fixed filter for a cistern instead of a well, he will see a description of one which I have found to be very suitable, in a former volume. *R. S., Edinburgh.*

How to keep Cucumbers fresh after they are cut.—On the 15th inst. I had three brace of Cucumbers more than I wanted for present use, and I have contrived to keep them fresh in the following manner. I placed them in my Cucumber box, covered them with dry paper, buried them in silver sand, and I have them now as good as when I cut them, and to all appearance they will keep for 10 days longer. The sort is Mills' Jewess. *H. Stilwell, Frogmore, St. Alban's, Herts.*

Rearing of Silkworms in England.—Your correspondents upon this subject do not seem to have had much personal experience in the management of silkworms. I believe a Mr. Buckworth, a merchant, tried to introduce silkworms into England, but abandoned the attempt. For several years myself and others (a family party), used to rear a large number for amusement; we fed, watched, and tended them; spun the silk, and all *et cæteras*, amongst us. As soon as the eggs were hatched, we commenced feeding the young worms with Lettuce leaves; and when Mulberry leaves were abundant, we then changed their diet for these. We had a very fine quantity of silk, of various shades. To produce silk enough for trade purposes, or rather for commerce, it must be conducted upon a factory system. There is no secret in the art of rearing silkworms, nor in their management; the great difficulty lies in getting a sufficiency of food, and, this consisting principally or altogether of the leaves of the Mulberry tree, till such time as these are cultivated in sufficient numbers to provide these interesting creatures with support, there is no hope of an English silk trade. *X. Y. Z., Hants.*

Vine Borders.—We have had the large Vines at Hampton-court and at Cumberland-lodge pointed out to us as examples of good Vine growing. The former has been produced in a sandy alluvial soil resting on a gravelly bottom, and the latter in sandy loam, also on gravel. We may therefore infer that good drainage is necessary. The next thing recommended is rich soil, because the Vine must be well fed; but in the gardens at Nettlescombe, Somersetshire, a black Hamburgh Vine was planted, I should say about 18 years ago, on a rock, and on the south side of the gardener's house: it grew with such rapidity that I was induced to make some inquiries as to the nature of the material it was planted in. I found that two barrow loads of stones had been taken out of the rock, and that the hole had been filled up with soil, over which flat stones were laid in mortar, making the surface as firm as the rock. The soil must have been exhausted of its nourishment in two years, and the top had no more protection than Nature provided for it. I spent seven years in the garden at Nettlescombe, and was eye-witness to the amount of its produce, which was sometimes enormous. If the bunches had had the assistance of a frame in the process of swelling, they would have weighed on an average 1 lb. each. They were always well coloured, and, in favourable seasons, excellent in flavour. I never saw half the quantity of Grapes on a single Vine as were on this one, except the one at Hampton Court (the Cumberland-lodge one I never saw). It has a straight stem about 8 feet in height, where it branches out horizontally, carrying a leader to the roof on either side of the stem. The branches are about 20 inches apart, and well trained. In October, 1845 (the last time I saw this Vine), it was completely loaded with fruit, although Grapes had been taken from it to supply the table for a long time. In the previous year it furnished the house with fruit up to the time the frost set in, when the remainder was removed to the fruit-room. Although no assistance could be given it in the shape of nourishment, I have taken shoots from the points of the branches 15 feet in length, and of no ordinary circumference. The rock out of which it grew consists of a red gritstone, belonging to the slate formation. This kind of material is excellent for retaining just sufficient moisture to support a healthy vegetation and no more. I am afraid that many will find Mr. Spencer's remarks too true, viz., that in the course of ten years or more, undrained rich compost Vine borders will become a heavy sour mass. I saw one lately that had been made about that time, and which appeared to consist of a rich mixture of soils; the Vines had done well in it for some time, but ultimately the fibrous roots gradually decayed, until at last the Vines had hardly strength to make a shoot. The whole was remade, and it was then ascertained that the old border had been formed six feet deep, without stone or rough material of any kind being placed in the bottom for carrying off the stagnant water. The situation was naturally damp, which aggravated the evil. *W. Culverwell, Thorp Perrow.*

Phaius grandifolius.—Perhaps no plant, either in the Orchid-house or stove, better repays a little extra care and attention than this Phaius, and if induced to put forth its blossoms at this season of the year, it is sure to be greatly admired. A plant of it here, at the present time, is sending up 12 flower-spikes, each about 5 feet high, and having from 12 to 17 blossoms, and the leaves are from 3 to 4 feet in length, giving the plant altogether a noble, Palm-like appearance. In describing the method of cultivating it, we will begin with a young plant in February. I then place it at once in the warmest part of the stove or Orchid-house, and give it every encouragement in the way of plenty of root room, heat, air, and moisture. The soil which I employ for it is peat and loam, using plenty of crocks, and I never on any account allow the roots to become pot-bound, as it is next to impossible to grow a large plant in a small pot. My largest specimen occupies a tub 20 inches wide and 15 inches deep. I keep my plant growing on in this way for about 12 months, at the expiration of which it generally shows symptoms of blooming. At all events it will flower as soon as it has strength enough, and the higher the culture the stronger and finer will the bloom be. After blossoming, the same treatment is again pursued. The temperature I grow it in is from 57° to 75° in winter, and from 65° to 90° in summer. *J. Rust, Dec.* 24.

Vines.—Seeing that a little renewal of discussion on Vines and Vine culture has been invited, I forward a slight sketch of my experience with a young plant of white Muscat of Alexandria, which was introduced into my Vinery on the 1st of June last year, being planted in the front border outside, in a growing state, the roots being thoroughly opened out, deprived of soil, and carefully diffused in planting *secundum artem*. I believe the stem at that time was not $\frac{3}{8}$ of an inch diameter in the thickest part. About 17 months after, I cut from this Vine three bunches of Grapes weighing $2\frac{1}{4}$ lbs., $2\frac{1}{2}$ lbs., and 2 lbs. 14 oz., respectively; some berries of these bunches were somewhat shrivelled when cut; having been left to the last, for inspection, on account of their size and beauty; otherwise, had they been cut when in perfection, the weight would of course have been greater. I am not sure there is anything extraordinary in these weights, but on referring to records of weights of similar kinds of Grapes in former volumes of the *Gardeners' Chronicle*, I find those grown at Eshton-hall (5 miles hence), by J. Roberts, in 1847, and which took first prizes at the Exhibitions both of London and York, weighed only 2 lbs. 5 oz.; and, subsequently, those grown at Castle Malgwyn 2 lbs. 9 oz. The quality of my fruit was, in the opinion of competent judges, first-rate; the berries large, uniformly ripe, and full flavoured. The Vine bore in all seven bunches, and although those previously cut were not weighed, yet, by comparison, the total weight of fruit from this plant could not be less than 16 lbs. on 4 feet 6 inches of stem on the rafter, to which length it was cut back at last winter's pruning. I suppose most Vine growers would pronounce this an excessive crop for so young a Vine to be allowed to bear. Time only can show whether it will prove to have been an injurious one. I do not anticipate any after bad effects from it; the luxuriance of this Vine being such, that after going to the top of the rafter, *i. e.* 19 feet from front sill stone, the leader ramified right and left on the back of the house, making 19 or 20 feet more, besides many strong lateral branches, which were with difficulty kept within any reasonable bounds by stopping; and after this growth, and during the maturation of the before-named quantity of fruit, a second bloom of 8 or 10 bunches showed themselves from the newly formed wood, but these were of course removed. *T. W., Thorton-in-Craven, near Skipton, Yorkshire.*—In reading the remarks of Mr. Kidd, at page 790, I was astonished with one observation, viz., that the obtaining good Muscat and Black Hamburgh Grapes in one house was all chance work, unless by scheming and contriving. For my own part I find no difficulty in producing excellent Grapes of both kinds in one house under the ordinary treatment of Muscats, allowing abundance of air on all favourable occasions, after the fruit is well set, as it is my belief that one of the principal causes of bad coloured Grapes is too close an atmosphere. Mr. "K.'s" strictures respecting the last May exhibition at Chiswick are quite true; there was scarcely a good dish of Grapes there, at least not well coloured, nor yet well bloomed, which confirms my opinion that airing well is one of the most essential things to be attended to in Vine culture. I regret that I had not the privilege of exhibiting a dish of Muscat and Black Hamburgh, both grown in one house, at the exhibition just alluded to. *W. T. B.*

Chiswick Temperature, versus Holkham.—The explanation as to the position of your thermometer, does not appear sufficiently to account for the difference in the two readings, for I find that on one night, Nov. 16th, when the sky was perfectly cloudless, and our temperature should be low, it was 5° in excess, while on several nights, including the 9th and 22d Nov., and 4th Dec., on which the sky was completely overcast, and radiation consequently small, the temperature was below that at Chiswick. I do not, however, feel by any means certain that the readings upon which your comparisons are based are at all comparable with each other; observations under precisely similar circumstances are required for this purpose, which I will endeavour to supply, and then the mean temperature at Holkham will, I think, be found to approximate much more closely to yours than you appear to suppose. Most, if not all, meteorologists of the present day, record the readings of their instruments (placed at the height of 4 feet from the ground, and protected from radiation) at stated hours, with the words "*max.* or *min.* in the previous 24 hours," as a heading to the column, and in taking the mean temperature of a given day, use the highest and lowest readings recorded in that natural day, *i. e.* from midnight to midnight. That the lowest temperature of a day occurs about half an hour or an hour before sun-rise, and the highest about 2 P.M., as a rule—to which of course there are exceptions, from various causes—has been too often proved from series of hourly observations to admit of a doubt. You do not name the hour at which your observations are taken, and this seems to be an important point; for if it should be about or previous to 7.30 A.M. you would have the same lowest temperature recorded on each day as we should, at this period of the year, while in the summer months your lowest of the 24th would be ours of the 25th day. *S. S.* [The indications of the self-registering thermometer at Chiswick are usually read off between 10 and 11 A.M.; unless the temperature before that time is likely to rise higher than the maximum of the preceding day, and in that case the registration is noted earlier. In short, the observations are taken so as to obtain the extreme maximum and minimum of each day and night; and no stated time will ensure this.]

Gutta Percha Piping.—As it is well known that persons have been much injured in their health by drinking water which had passed through, and particularly rested in, leaden pipes, I wish to ask if any of your correspondents can, from experience, inform me if gutta percha piping communicates any injurious qualities to water passing through it! or, if any chemist has reason to believe that such would be the case! or, whether rats are likely or able to gnaw such piping! *L. L., Clevedon, Dec.* 23. [There is no reason to suppose that the gutta percha will injure the water. But, as for the rats—that is a different question.]

Societies.

Caledonian Horticultural, *December* 5.—Lord Murray in the chair.—On this occasion office-bearers were chosen for the ensuing year, and several new members elected. Prizes for subjects of exhibition were awarded as follows:—1st, three sorts of Pears, fit for the dessert, and exclusive of Marie Louise, Mr. Bell, gr. to Lord Mackenzie, for Easter Beurré, Beurré Diel, and Beurré d' Aremberg. Four Marie Louise Pears: 1st, Mr. Hamilton, gr. to Sir D. Kinloch. Six Table Apples: 1st, Mr. Calder, Seacliff, for Ribston Pippin, Old Nonpareil, Cambusnethen, Cornish Aromatic, and Seacliff; 2d, Mr. Addison, gr. to the Earl of Wemyss, for Crofton Pippin, Blenheim Orange, Ribston Pippin, King of the Pippins, Borsdörffer, and Scarlet Nonpareil. Bunch of retarded Grapes: 1st, Mr. Lees, gr. to the Earl of Haddington, for Muscat of Alexandria; 2d, Mr. Addison, for Black Hamburgh. 12 finest-flowered single clusters of Chinese Chrysanthemums: 1st, Mr. Young, gr. to Mrs. H. N. Ferguson, with the following varieties:—Superb Clustered Yellow, Comte de Rautzen, Queen of Gipsies, Marquis, Incomparable, Minerva, Duc de Nemours, Fleur de Marie, Salter's Annie, General Morceau, and Queen of Yellows. Best

two Chinese Primroses: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for well-grown plants of double white and a fine variety of single red. Two stalks of Brussels Sprouts: 1st, Mr. Thompson, gr. to R. S. Wilson, Esq., the variety being Hunter's Dwarf. Four Leeks: 1st, Mr. Lees, Tyninghame, for Improved Musselburgh. Four stalks of solid Celery: 1st, Mr. Sinclair, gr., Tillichewan Castle, with Goodall's Broad White and Cole's Superb Red. Three sorts of Onions: 1st, Mr. Henderson, gr., Alderston, for Blood Red, James' Keeping, and Strasburg; 2d, Mr. Pousty, for Globe, James' Keeping, and Strasburg. Two heads of Endive: 1st, Mr. J. Renny, Inch House. For the Silver Medal offered by the Society for the best collection of dried specimens of British Plants, including Filices: two competitors appeared, both of whose collections were excellent. The prize was awarded to Mr. Anderson, journeyman, Edinburgh Botanic Garden, his collection containing 640 species correctly named, and arranged according to the natural system. A second prize, with Certificate of Merit, was voted to Mr. Smith, journeyman, Experimental Garden, for a collection containing about 520 species and varieties, likewise arranged according to the natural system. The prize of two guineas offered by Messrs. P. Lawson and Son, for the best collection of dried specimens of Hardy Perennial Herbaceous Plants, was awarded to Mr. Fairley, journeyman, Edinburgh Botanic Garden, who produced a most excellent collection, containing 1859 species and varieties, arranged according to the natural system of Lindley, as given in the last edition of the "Vegetable Kingdom." As usual, there were likewise various productions sent for exhibition only, for which extra awards were made, or thanks voted according to circumstances. Amongst the fruits, may be noticed a large and fine collection of named Pears from M. Rene Langelier, Jersey; Sweet Water Grapes from Mr. Renny, Inch House; two dishes of seedling Filberts from the garden of Lady Harris, Seacliff,—a certificate of merit being granted for one of the sorts; 18 varieties of Dessert Pears from the garden of Sir W. Gibson-Craig, Bart.; Gloria Mundi Apples from W. Crawfurd, Esq.; Nonpareil Apples from Mr. M'Farlane; Alfriston Apples from Mr. Lauder; Grapes ripened on the open wall (with the protection of a glazed sash from 1st October), from Mr. Sanderson, Monkton Hall; and fruit of Saracha viscosa, with a sample of jam made from it, from S. B. Hare, Esq., Lochvin House. There were likewise exhibited, from Messrs. J. Dickson and Sons, a large plant of Pinus longifolia; from the garden of Dr. Neill, a beautifully flowered plant of Oncidium ornithorynchum, and two fine Chrysanthemums; beautiful Heaths and Cinerarias from Mr. Anderson, gr., Corstorphine-hill; well grown plants of tree Mignonette and Cinerarias from Mr. Laing, gr. to the Earl of Rosslyn; a seedling Cineraria from Mr. Young, Newington-lodge; a box of superior Chrysanthemum blooms from Mr. Stark, Edgehill Nursery; a beautiful bouquet and Chrysanthemums from Mr. Reid, Edmonstone House; and collections of Chrysanthemums from Mr. Young, Archerfield, and Mr. Addison, Gosford; a plant of Cupressus torulosa from Mr. Wilkie, gr., Garvald House, accompanied by a communication mentioning its hardiness at Garvald, at an elevation of 1200 feet; and a large coloured drawing of Victoria Regia by Mr. Jaffrey, Warriston-lodge. Some excellent vegetables were sent for exhibition. Specimens of the Glen Dwarf Drumhead Cabbage—stated to be a valuable variety for agricultural as well as garden purposes—from Mr. Handasyde, Musselburgh; two large Savoys from Mrs. Dr. Brown, Primrose-bank; fine Cauliflower, Mushrooms, and Seakale, from Mr. Pender Moredun; improved German Greens from Mr. M'Lean; Red Cabbage from Mr. Blair; Brussels Sprouts, Beet-root, and Cauliflower, from Mr. Kerr; Lettuce and Endive from Mr. Renny; and a basket of Tomatoes from Mr. Bell.

Glasgow Royal Botanic Institution.—At the annual general meeting held Dec. 9, the Vice-President in the chair, the Secretary read a report from the Directors for the past year, by which it appeared that the total revenue amounts to 861*l.* 8*s.* 11*d.*, including the 108*l.* 13*s.* 8*d.* of annual feu-duties belonging to the Institution, which, with 76*l.* 16*s.* 6½*d.*, the balance of the revenue account for the previous year, makes a total of 938*l.* 5*s.* 5½*d.*; the total annual expenditure, exclusive of interest, being 908*l.* 18*s.* 5½*d.*

The preceding is a comparative statement of the receipts for last year, as compared with those of the previous year. From this it will be seen that there is a considerable increase on the two most important sources of revenue, viz., 61*l.* 14*s.* 9*d.* on annual subscriptions, and 81*l.* 16*s.* 3*d.* on the sale of cut flowers, plants, &c. The decrease on the receipts for mechanics' tickets, and for admission on ordinary days, may principally be attributed to the arrangement entered into with the Magistrates and Town Council, whereby the working classes have now, in addition to five days in the Fair week, free access to the Garden on the first Monday and Tuesday of the months of April, May, June, August, September, and October. The Garden itself is reported to be now in a higher state of cultivation than it has been in for several years. The hot-houses and other buildings are also in good order, and since the beginning of spring one-half of the hot-houses has been painted. Greater abundance and variety of ornamental plants exist both out of doors and in the hot-houses, than have been for a number of years past. During some previous years the imperative necessity of raising revenue from any source led to the ruthless and indiscriminate cutting down of even the rarest specimen plants in the stoves, but the injurious practice has been stopped, and the houses are gradually resuming the appearance which, in a Botanic Garden, they ought to have. Considerable improvements are being made in the Garden, by increasing the stock of evergreens, and extending them in groups over the higher parts of the grounds, as well as skirting certain parts of the wooded river bank. A Lecture Room for the Professor of Botany has been erected in the Garden during the course of the summer, the total cost of which, including the architect and measurer's fees, was 275*l.* 10*s.* 11*d.* It is stated that the working classes continue to appreciate the free days' admission to the Garden, granted to them through the liberality of Mr. Campbell, and the arrangement with the City Corporation. On Mr. Campbell's five days upwards of 55,000 persons visited the Garden, and on the other free days secured to them by the city nearly 24,000.

Reviews.

Voices from the Woodlands, by Mary Roberts; and a *Popular History of Mammalia*, by Adam White; are two charming books for presents to young people. They are written with taste and talent, and decorated with numerous coloured plates, got up with Mr. Lovell Reeves' well-known skill. The first tells of the Lichens and Mosses of winter, and reminds us of the sweet days of summer by its stories of the old Oak trees of England, and the graceful Ash, and the shady Beech, and the Elms, and all the rest of the old aristocracy of the forest. The authoress, by happily employing the first person singular in her narrative, has compelled these ancient princes, each to tell his own story in his own way. The Spanish Chestnut, for example, speaks thus:

"Men call me the old Chestnut of Tortworth. That aged tree, say they, stood there when King John came to the throne, and must have been at least 540 years old. One of their scribes relate that I even then was called by the name which I now bear, and which attaches to me, though little more than a venerable ruin.

"Some of you, young trees, have been planted within a comparatively short period; standing singly, or in groups, you embellish homes which had no existence in my young days. Far as the eye could reach, extended a wild forest, or wide common, covered with Ferns or Rushes; and deer came in troops, to feed upon my nuts in autumn. I have seen the wild boar, with his long tusks and shaggy mane, ranging where now sheep pasture; and wild cattle, such as no one could have met unharmed.

"I remember the time yonder Yew first arose from the earth, a small tufted plant, with nothing that indicated its future greatness. Some wandering bird must have brought the berry, which, on account of its glutinous nature, readily adheres; or else the wind, rising in his might, bore it from some distant forest; for none grew within sight. I watched the progress of that young tree, and saw how gradually it advanced from one season to another, till at length its giant arms were nobly tossed on high, and valorously resisted the fierce winds of winter. But now its strength begins to fail, and Oaks, beneath which the Druids walked, are failing also.

"Time was, when such noble trees were wrested from their right uses; when the Osiers that grew beside the river were wreathed into hideous baskets, wherein innocent persons suffered; when trees, rising in umbrageous majesty, concealed within their deep recesses abhorrent rites, concerning which no one dared to speak; when men saw only in the trees, which God had planted for beauty and for use, the abode of mysterious or fearful beings, demons whom many ignorantly worshipped; or viewed them as useful merely for the common purposes of life.

"Since then, naturalists have arisen, who have made known the properties of vegetable matter; poets have derived their choicest inspirations from trees; and artists have dwelt beneath them, watchful to transfer to canvas the effect produced by their foliage, or their graceful and magnificent proportions.

"But the Chestnut, as wrote one who loved our tribe, is the most stately of European trees, exceeding the Oak in height, and equalling it in bulk. The foliage exhibits a more decided character; it is glossy and formed into clusters, which are peculiarly elegant when surrounded with florescent catkins. This is the tree which graces the landscapes of Salvator Rosa. He studied it among the mountains of Calabria in every form and attitude, breaking and disposing it in a thousand different shapes, as the exigencies of his compositions required. And, truly, no other tree affords such continual variety—at one time rising in all its leafy majesty, in some shady recess or rock-encircled nook, safe from the war of winds; at another, broken and distorted on some high rock, or half-way down a steep and rugged declivity, beneath which might roll an impetuous torrent; for my wood is naturally brittle, and liable to be shattered by fierce winds.

"Some have ascribed to me the honour of being indigenous to Britain; others maintain that Cæsar transported Chestnut trees from Sardis into Italy, on account of the excellence of their nuts, from whence they passed into France and Britain. True it is that none of our tribe ever prevailed in North Britain, nor have they been observed in the southern portion of the island, except in parks, and avenues leading to country mansions; but those who visit the banks of the Tamar, in Cornwall, may find the Chestnut in many a lone spot, as also in the woods and hedges of Kent and Surrey. Anglesey is another of our favourite habitats; and Chestnuts were so numerous at one time in the forest of Dean, that Henry II. gave the tithe of all their fruits to Flaxley Abbey. Those noble trees were, doubtless, planted and protected in that royal preserve."

Mr. Adam White's Book is of a more formal character, but not a whit less interesting. He tells of lions and tigers and jaguars, of baboons, mandrils, and marimondas, dogs and opossums, whales, dolphins, seals, antelopes, and dassies. His style is clear, and his matter anecdotical; but he does not sacrifice science for the sake of catching a little ignorant applause, nor, on the other hand, can it be said that he annoys the reader with misplaced injudicious technicalities. With access to the best kind of information, and with skill to use it, he has produced a book which people of all ages will read with pleasure and profit. As an elementary work on mammals, it stands without an English rival. We select his account of the Bandicoots.

"The tribe of Bandicoots (*Peramelina*) is distinguished by the number of the incisors; there are ten of these teeth in the upper, and six in the lower jaw. Their molars are of two kinds, some being compressed and pointed, while the others are tubercular—a structure which, as in the Insectivorous order of quadrupeds, particularly suits an insect diet. The head is for the most part sharp and elongated; the legs are unequal in length, the fore ones being shorter than the posterior. The tail is generally short, and partially covered with short hairs; in one or two species, however, it is long, and furnished with lengthened hairs.

"The tribe acquires its name from the typical genus, *Perameles*, which contains the Bandicoots of Australia—quadrupeds generally of small size, which seem to represent in that continent-island the hedgehogs, shrews, and other insectivorous mammalia. All the species have five toes to the fore foot, the two outside being rudimentary and nailless, and the middle three with large strong nails, so that at first sight they seem to have but three toes to the foot; in the hind foot there are five toes, the innermost of which is rudimentary, the second and third are slender, while the fourth and fifth are large, and provided with long nails: all these nails are well suited to the burrowing habits of the bandicoots. The ears are generally of moderate size; but in one species, *Perameles lagotis*, the 'native rabbit' of the colonists of Western Australia, these organs are very long. This species, as ascertained by Mr. Goold, is tolerably abundant in the grassy districts of the Swan River colony. It generally selects spots where, the soil being loose, it can easily form its burrows, and to these, when pursued, it has recourse. Its food consists of insects and grubs. The flesh is eaten, and said to resemble that of the rabbit. Mr. Waterhouse, in his 'Marsupialia' (p. 36), tells us that a specimen kept in the Zoological Gardens was very active at night, but sleepy during the day; when at rest it sat on its haunches, with its head thrust between its hind legs, and then had the appearance of a large ball of fur. When walking, the hind legs only were used, and these were very widely separated. In confinement it was very savage, and bit severely.

"Mr. Gray has described a very pretty species from Van Diemen's Land, the *Perameles Gunnii*, called in that island the *Bandicoot*. Both the tail and ears are short; the hinder part of the back is black, with several white cross-bands. It is an abundant species, and, according to Mr. Gunn's account, burrows in the ground, and lives chiefly on roots. This animal seems particularly partial to bulbs; Mr. Gunn knew of an entire collection of Cape bulbs being eaten by them, and he himself lost many valuable specimens in his garden from their attacks.

"Some of the species of bandicoots make nests of sticks and grasses, so closely resembling the colour and appearance of the situation where they are placed as to be very difficult of detection.

"To this family belongs the singular genus *Chœropas*, discovered by Sir Thomas Mitchell on the banks of the Murray River, in Australia. The first specimen found was tailless, but subsequent individuals have been met with possessing this member; the fore legs somewhat resemble those of a pig, from which circumstance the generic name is derived. The marsupial opening is downwards, and not upwards; Sir Thomas says it was seen first on the ground, but on being pursued took to a tree, in which it was caught."

Garden Memoranda.

Ealing Park.—It may be interesting to know that the Amherstia nobilis at Ealing Park is in a most flourishing condition. It measures 14 feet across at the base, tapers gracefully upwards rather more than 15 feet, is covered with *perfect* foliage, and is at the present time showing 73 spikes of flowers, some of them *already* more than a foot in length. Another botanical curiosity also exists here in the shape of a striped Cattleya. As regards the collection of plants generally (even the Orchids and Heaths), it may safely be said that it is in a state of vigour and beauty, such as it has seldom appeared in before.

Miscellaneous.

Testimonial to Mr. Munro.—The other day, at a dinner provided by a few friends, Mr. Munro was presented with a handsome gold watch and chain, the proceeds of the subscriptions of 260 persons, who thus testified their respect for him on his retirement from the service of the Horticultural Society.

New Method of Engraving Plates for Printing Ferns, Sea Weeds, &c.—At a recent meeting of the Sheffield Literary and Philosophical Society, Dr. Branson read a paper describing this process.—His mode of operation is to place a frond of Fern, Algæ, or similar flat vegetable form, on a thick piece of glass, or polished marble; then taking and softening a piece of gutta percha, of proper size, and placing on the leaf and carefully pressing it down, it will receive a sharp and accurate impression from the plant. The gutta percha retained level and allowed to harden by cooling, is then handed to a brass caster, who reproduces it in metal from his moulding vase. This, it will be obvious, is the most delicate and difficult part of the process, and one which, a few years ago, would not, we suspect, have been executed in Sheffield. As it is, Dr. Branson has had many brass plates thus produced from sand-casting, which only required a little surface dressing to yield, at once, under the copper-plate printing press, most beautiful as well as faithful impressions of the original leaves: indeed, many of the exhibited specimens of Ferns, printed in green colour, and slightly embossed, as they must needs be by the printing, were such perfect fac-similes of the natural pattern, that they might easily be taken for it. Besides these matters, the Doctor exhibited a large variety of patterns of embossed leather, which had been produced by a somewhat analogous operation. As, however, this latter invention is not so much for copying designs as for creating them, and, at the same time, saving all the expense of die-cutting, the following is the course pursued:—The operator takes a piece of common hard white soap of the required size and surface, and upon that executes any design, whether of the depth and boldness of ordinary embossing, or in the delicate lines of an etching; in either case the work is executed with the greatest ease. From this soap-model or engraving, an impression is taken in gutta percha; from that a secondary one, which on being cast in brass, as before, may be used for printing or embossing in the ordinary way. The reader stated that his main difficulty was in getting the last gutta percha coat to separate from the mould of the same substance into which it was pressed. He had found, however, that by powdering both the surfaces with common bronze dust, before taking the impression, they did not adhere. *Athenæum.*

Lawn Grasses.—Where good turf can be had without much trouble or expense, it will be more immediately beautiful and satisfying than sowing down a lawn with fresh seeds. And even if it be too serious an item under any circumstances, the edgings of walks, and the outlines of beds, should be everywhere defined by a strip of old turf, at least a foot in width. This will prevent the seeds from being scattered on the walks or borders, and make the edgings firmer and less ragged for several years. For sowing down Grass seeds, the ground should be lightly dug over about the last week in March or August, and the seeds sown immediately after. It will be advisable to scatter them rather thickly, and then tread and rake them well in, and give the ground a thorough rolling. Care must be exercised to make up the ground, by the edgings already laid, to the level of the top of those edgings; in order that, when the young Grass springs up, all may be on the same level, and there may not be a break or dip between the old and the new. After the Grass has vegetated, it will simply require to be kept free from weeds until it is strong enough to be mown. A dry day, in a showery season, will of course be best for sowing Grass, as it is for all other seeds. And it ought not to be forgotten that, on the evenness with which the ground is dug, levelled, and raked, will, hereafter, be the beauty and smoothness of the lawn. Some of the fittest seeds for a lawn are Poa pratensis and triviale, Festuca ovina, Cynosurus cristatus, Avena flavescens, Trifolium minus, and white Dutch Clover. Other and coarser kinds are usually added; and many good nurserymen have mixtures of their own, adapted to particular soils. But the smaller the proportion of the stronger growing kinds that is admitted, the finer, and smoother, and softer will be the Grass, and the less mowing will it require. Any sort of Rye-grass, some variety of which is too commonly introduced into mixtures, will be especially unsuitable. *Kemp, on Small Gardens.*

Calendar of Operations.

(For the ensuing week.)

FORCING DEPARTMENT.

Let the fermenting material upon borders which are already in motion be examined, to see that it does not get either too hot or too cold; the former state of things will render it necessary to open it out or remove a portion of it; but in the latter case it should be turned over and a fresh portion be mixed up along with it. When the flowers are just expanding, a drier atmosphere must be maintained, and syringing must be carefully avoided until the fruit is fairly set. Avoid a high temperature at night, and admit air freely in fine weather, but using the side ventilators only when it is showery. When the weather is unfit for out of doors work concentrate your force within and proceed with the cleansing and painting of the house and plants according to the directions previously given. Only one house should be in hand at a time, and that the various operations may be carried on systematically, all the moveable plants should be quartered amongst the other houses, pits, frames, &c.; and after the house is finished it may be filled with the plants from the house which it is next intended to treat in a similar manner.

FLOWER GARDEN.

When the ground is too frosty to admit of the transplanting of the trees and shrubs being proceeded with, everything should be done which forethought can suggest, in making such preparations as will facilitate the work to the greatest extent, when the weather is more favourable. To this end the stations for the plants may be prepared by conveying suitable soil, &c., to the spot, and by making holes or raising mounds for their reception. The value of the mowing machine is now becoming so well known as to be in little need of praise. During mild weather, any turf that is sunk and so uneven as to prevent its being easily mown by that most useful of all garden implements, "Shanks's Mowing Machine," should be made perfectly even, by removing the turf and levelling the surface beneath it. If it is infested with worms, which render a pleasure-ground so unsightly, a layer of fine coal ashes should be spread over the soil and well rolled in before the turf is replaced. This is a simple but effectual remedy for the nuisance, and in addition much improves the quality of the turf; as the latter becomes finer and denser, and cuts "sweeter" than when the ground is clayey or damp beneath it. Seeds of Rhododendrons and Azaleas should now be watched, and gathered as soon as the capsules begin to burst.

FLORISTS' FLOWERS.

At this season, the routine culture, which we have lately enforced, must be strictly attended to; but Polyanthuses will, perhaps, claim an extra notice in these our last directions for the year. Those on beds, if parted at the usual time, will often have the collar exposed too much, and the roots completely bare; independent of this, earth-worms will have drawn leaves, &c., into their holes, which, with their castings, give the beds an untidy appearance. Our plan is, to carefully fork the soil, with an instrument purposely made, so as to disturb the fibres of the plants as little as possible, removing the decayed or broken leaves. We then, with a mixture of decayed leaves, and cow-manure, which we have had prepared, and under cover some time previously, go carefully over the bed, filling up all inequalities, placing a couple of handfuls round each plant; in fact, giving them a complete top dressing. This operation, we are confident, will prove highly satisfactory, when completed; and the effects will be perceived by a strong and vigorous start in the spring. We may here mention, that one of the best Polyanthuses that has come under our notice during the past year, is Addis's King-fisher, a red flower; but of most excellent properties. Should severe frost, or heavy rains, prevail, it will be highly proper to protect the most valuable Tulip beds from their effects. The result will well repay the trouble. Recollect the advice of abundance of air, when not too cutting or severe, to all plants in frames.

HARDY FRUIT DEPARTMENT.

Fruit-room.—When this place is not furnished with a stove or a coil of hot-water pipes, considerable difficulty is experienced at this season in excluding the cold and damp. Of the two, perhaps, the latter is the greater enemy. It may, however, be remedied by spreading some unslaked lime in wide pans or drawers, exposing as much as possible of its surface to the atmosphere, and exchanging it for fresh as soon as its absorbing powers are somewhat satisfied. Frost should be excluded if possible; but if this is to be effected by the aid of artificial heat, the latter should always be used in connection with ventilation, that the moisture evaporated may be allowed to escape. But if there are no such conveniences, the simple means of matting up the doors and windows must be adopted; and if, in spite of these precautions, the internal temperature falls below the freezing point, care must be taken to prevent a sudden thaw, by keeping the room close and shaded for a short period after the return of warmer weather. This points out the advantage of constructing such places on the north side of a wall, as they are thereby preserved from extreme heat in summer, and from sudden variations in winter. Many of the finest dessert Pears require placing in a temperature of 60° for a few days previous to use, thence they will become quite ripe and will attain to their full richness of flavour, while they would lay in the cool fruit-room shrivelling till useless. We have ourselves thrown away Pears which the experience of after years has told us would have been most useful, if they had been simply rolled in paper and placed for a few days in a Pine-pit.

KITCHEN GARDEN.

Let trenching of vacant ground be done with all convenient despatch, unless when it is frozen; as the clods, if turned under in that state, will remain a long time ere they thaw; the loosening of the soil, by creating non-conducting cavities, checks the progress of heat either upwards or downwards. Instances have been recorded of ground being trenched during severe frost, and of the clods being found only partially thawed at Midsummer. In mentioning the protection of kitchen garden crops, we omitted to recommend the branches of Spruce Fir, Yew, or other evergreens. These are quite as effectual, if used in sufficient abundance, as litter and other matters, which are too untidy to be seen in a well-kept kitchen garden. Attend to the forcing of Rhubarb, Seakale, Asparagus, Chicory, &c., and keep up a supply, if possible, equal to the demand. Let Cauliflowers, Endive, and Lettuce, in frames, be frequently examined, and divested of decaying foliage; and protect from the ravages of slugs, by carefully sprinkling a little lime and soot upon the surface of the soil.

State of the Weather near London, for the week ending Dec. 26, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 30th 1833—therm. 56 deg.; and the lowest on the 1st, 1837—therm. 12 deg.

Notices to Correspondents.

Elms: *Gallicus.* The Chichester Elm, alias the Huntingdon, is a variety of Ulmus campestris. It grows faster than any other equally good Elm, except the Witch.

Grafting: *W Nichols.* We have in preparation a complete set of drawings illustrative of every one of the methods of grafting, fanciful as well as essential, which are known. If the cuts are ready, we shall commence next week.

Insects: *A B C.* Your Cineraria leaves are attacked by the larvæ of a small two-winged fly (Musca) which eat the substance of the leaves, leaving the two surfaces entire. We know no other remedy than to press the leaves gently between the thumb and finger as soon as the pale marks appear, as the larvæ are then young and tender. At present all the mischief seems to have been done, as we found the insect in the brown chrysalis state. *W.*

Mistletoe: *F B.* It may be propagated from seeds or by grafting. The seeds should be put in in February or March. Slit the bark on the under side of the branch, say of an Apple or Hawthorn tree, making the cut quite down to the wood; raise the bark up a little, then insert the seeds freshly squeezed from the berry, press down the bark again, and the operation is finished. It may be grafted any time in May. Make an incision, and insert a thin slice of Mistletoe, having a bud and one leaf at the end. You will, however, we imagine, be most successful with seeds. The Mistletoe will grow upon the Hawthorn, Apple, Black Italian Poplar, Lime, Sycamore, Acacia, Laurel, Willow, and with difficulty on Oak.‡

Names of Fruits: *T W.* 1, Pearson's Plate; 3, Barcelona Pearmain; 4, Beauty of Kent; 6, Herefordshire Pearmain; 7, Fearn's Pippin; 8, French Crab; 9, Court of Wick; 10, 14, Reinette du Canada; 15, Syke House Russet; 17, Golden Reinette; 19, New Golden Pippin; 1, Passe Colmar; 2, Decayed, but appears to be the Doyenné Gris. ‖—*T H S.* The Beurré d'Aremberg. ‖

Names of Plants: *Reader.* Adiantum assimile. *S.*—*H D.* Pekea tuberculosa. The Saouri nut.—*H Stillwell.* Fuchsia microphylla.

Nurserymen's Orders: *W Francis.* The Darlington case is under enquiry.

Oils: *Dido.* Walnuts yield a drying oil, employed by painters in oil-colour, and called Nut-oil. Hazel nuts yield a sweet oil like that of Almonds.

Paint used for Iron-work at Trentham: *D F.* One-third Stockholm tar, and two-thirds gas tar, laid on while quite hot, with a brush, and spread as thinly as possible.‡

Seeds: *J H N.* Sow your seeds from Jamaica in heat, and treat them as stove plants.‡

Taxidermy: *W J.* You will find Lee's work on this subject a good one.

Vine Borders: *J A, Limerick.* Certainly it will be advantageous to your border to put it in communication with the inside of your house, by removing a few bricks; four to a yard would be enough. The zinc tube would, we think, be superfluous. Musa Cavendishii will not thrive in a cool house. Probably Hood on Warming may contain what you want. There is nothing good on ventilating hothouses.

Water: *Yorkshire.* If spring water is received into a large cistern, exposing a surface of 2 feet by 6 feet to the influence of the atmosphere, such water will be suitable to water plants with, but not so good as rain-water.

Worm-Eaten Wood: *R W P.* Steep your carvings in a solution of corrosive sublimate; and if you can, apply a little heat. You will hear no more of insects, and the existing holes you can fill with putty or any other cement. It is necessary that the sublimate should enter the holes, and this will be most readily secured by the application of heat. If you are unable to do this, then you had better employ corrosive sublimate dissolved in spirit, which will enter the holes more readily.

Misc: *A Friend* is thanked for his suggestion, but there are difficulties in the way. The index is repeated in full at the end of the year.

*** As usual many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

This day is published,

THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, No. XXVI.

The Progress of Agricultural Knowledge during the last Eight Years. Mr. Pusey, M.P.
The Potato Disease. Mr. Graham.
Implement Report. Col. Challoner.
Kohl Rabi. Mr. Towers.
Ashes of Plants, Analyses of. Messrs. Way and Ogden.
Diseases of Stock from Mismanagement. Mr. Karkeek.
Agricultural Buildings. Mr. Dean.
Management of Pigs. Mr. Rowlandson.
Irrigation in Switzerland. Mr. Jenkinson.
Rape-cake as Food for Stock. Mr. Charnock.
Climate of the British Islands. Mr. Simpson.
Farming of Somersetshire. Mr. Acland.
Results from the Laboratory. Mr. Way.

JOHN MURRAY, Albemarle-street.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	...£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE or LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

The Agricultural Gazette.

SATURDAY, DECEMBER 28, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Jan.	1	Agricultural Society of England.
THURSDAY, —	2	Agricultural Imp. Society of Ireland.
WEDNESDAY, —	8	Agricultural Society of England.
THURSDAY, —	9	Agricultural Imp. Society of Ireland.

Now that the various local committees and officials connected with the Great Exhibition of 1851 have been able to sum up the applications for space, it appears that the total demands far exceed any amount of supply which Her Majesty's Commissioners can give; for although they have lately agreed to grant an additional gallery of 45,000 superficial feet, making a total of 220,000 superficial feet of floor and counter space, yet the amount demanded by exhibitors, who number, we may observe, about 8200, is 420,000 superficial feet of floor and counter, so that we have a deficiency of 200,000 superficial feet. This defalcation, however, may be counterbalanced to a certain extent, for the space demanded of wall for hanging articles on is only 200,000 superficial feet, and we believe considerably more than this amount can be given, so that many things for which counter-room has been demanded may be exhibited to little less advantage probably on the wall.

The above deficiency of space certainly indicates more than favourably for the great enterprise, and the manner in which it is to be supported by the spirited emulation of all nations. This was to be anticipated, although not perhaps to the extent now described. Intending exhibitors themselves were sensible that disappointments to a certain extent would be realised when they made their application; still, although this is true, yet in this case, as in all others, the evil hour is invariably postponed to the last for consideration; and, now that results are known, and the work of selection and rejection about to commence, many grave questions insinuate themselves upon the mind by no means quietly to be disposed of. Inventors are generally fond of their own offspring, manufacturers of their handiwork, and merchants of their purchases, but by all, sacrifices obviously must now be made. The work of selection therefore is a very important and responsible one—doubly so in the case of unpatented inventions; so that complaints may be expected, groundless, no doubt, in many instances, but too well founded probably in some.

Our object in introducing this subject at present before our readers is not to discuss the individual interests of exhibitors, but to confine our remarks as much as possible to the general interests of agriculture. The question which we wish answered is this—such being the deficiency of space in the immense building now being erected in Hyde Park—How is the interest of the farmer likely to be affected by it? Of all classes of the community, at present, he stands the most in need of chemical and mechanical inventions to assist him, for his difficulties are of more than ordinary character. Indeed, the vast majority are now agreed, that it is worse than useless and chimerical for him to look anywhere else than to energetic personal efforts for assistance; and he may therefore look with some interest on what the whole represented industry of the human family, as collected in Hyde Park, 1851, shall be able to do for him. Now, if the wants of the farmer are greater than those of the other classes, it is but reasonable to suppose that his demands for space in this exhibition have also been greater—a conclusion which we apprehend will be found a true one, although we have been unable as yet to ascertain it as a fact. We have no reason however to suppose anything to the contrary, for agricultural chemistry and mechanics, of late years have been making long strides in the march of improvement, and will require ample opportunity to develop their full proportions. As regards the heavy machinery for threshing and other agricultural operations, though these may exhibit much sameness in contrivance, yet it cannot be denied that very inferior articles sometimes occasion important discoveries by mechanical minds, and that the best judges, exercising the work of selection and rejection, are liable to error, especially when the articles to be compared are miles asunder from each other, so that losses may be sustained, and justice done unintentionally to intending exhibitors and the farmer.

Under such circumstances, therefore, is it possible to suggest any scheme which will secure individually and collectively the interests of all parties connected with agriculture? We think a practical scheme readily offers itself, for there is an abundance of space in the Park, immediately adjoining the upper end of the building, sufficient to accommodate every article connected with either home or foreign agriculture, which may be rejected, and if an additional 6*d.* or 1*s.* were demanded for admission into this department, it would defray the expense of erecting a temporary building, such as that used at the Royal Agricultural Society's summer exhibitions. All, therefore, that is necessary towards the organisation of such a scheme, is for the Agricultural Society to enter into the proper arrangements with Her Majesty's Commissioners, when we have no doubt the ground could be got, and all the privileges enjoyed by exhibitors in this department which are enjoyed in the building itself; or, if the Park is objected to, a thousand other places offer themselves for the pence at the gate on such an occasion. There is Islington cattle market almost empty and perfectly suitable. The whole could easily be placed under the control of the royal commission during the period of the Exhibition. There are no doubt objections to such a proposition, but at the same time we think that these are not worthy of comparison with the many benefits to be gained. And we hope that some such scheme will be acted upon with energy—if the interests of the *farmer* are not kept fully and strongly in mind, by those who have the work of wholesale rejection to perform, before the immense crowd of articles applying for space can be brought down to the number and dimension for which the building is calculated. *B.*

THE AGRICULTURAL LABOURERS.

THE condition of the English farm labourers has formed the subject of many admirable communications in the *Agricultural Gazette*, yet I venture to reopen it; not in the vain expectation that I can add anything new to the matter, but in the hope that some of the intelligent correspondents of this journal will revert to the question, and elaborate some practical scheme for bettering the condition of the rural poor.

In considering the present, it is natural to view the past state of the labourer in the prosperous times of farming, in order to judge by the comparison whether it is better or worse now than formerly. Assuming, according to the old rule, that a peck of Wheat in England is equivalent to the day's work of a labourer, it would at first view appear evident that—when a peck of Wheat cost two-thirds of its present price, and tea and sugar were double their present prices, and many other articles of cottage domestic economy much dearer, and wages were but one-third more than they now are—the labourer must have been in worse circumstances than he is at the present time. But it is to be borne in mind, as a counterbalancing consideration, that, when the price of bread was three-fold higher than now, the labourer, though able bodied and employed, received through the agency of poor-rates an allowance of bread for every individual in his family over the minimum number for which his wages were supposed to be adequate. The more mouths the more loaves; and thus he was enabled to support his family; yet many families were obliged to eat bread sparingly, to substitute Barley for wheaten bread, and to mix a considerable proportion of toppings and pollard with their wheaten flour, and to subsist on two meals a day.

I believe the fact to be, that a labourer with a large family, unless some of them are able to assist him in earning wages, is in worse circumstances now than a man with the same number of children was under the former high rates of wages and food; but that he who has only two or three mouths to supply with bread possesses more advantages than one in similar circumstances experienced formerly. Besides abundance of the best bread, a regular labourer has generally the produce of a garden or field allotment, which assists in the support of his family in a considerable degree. And it is to be supposed that he is now charged reduced rent for his cottage and patch of ground.

The condition of a labourer with a large family of young children is decidedly very bad at the present day in many parts of England; and in the part of the agricultural county in which I reside, where labourers' wages are only from 7*s.* to 8*s.* a week, without any privileges, he must find it difficult to live in anything like a state of comfort. His weekly accounts stands thus:—

5 gallons of flour, or equivalents	4*s.*	2*d.*
Fuel, salt, soap, and candles	1	6
Rent	1	6
Tea and sugar	0	10
Total	8*s.*	0*d.*

Where the maximum of regular wages is but 8*s.*, it is plain that a family consisting of many individuals, unless they earn extra sums at harvest work, to meet the charges for clothing, schooling, and contingencies, must be in a very distressed condition, yet a small family consuming perhaps but half the quantity of bread I have estimated, may enjoy the luxuries of tea and sugar, and a little meat occasionally, and butter with their bread. And the Potato, where it has not failed, is at this moment an important article in the support of the cottager's family. When corn was very dear, and land therefore highly prized by the farmer, the cottager was seldom privileged to have, as at present, from 20 to 40 roods for the supply of Potatoes, &c. Where labour wages are 10*s.* a week, with constant employment, as is stated to be the case in some counties almost generally, the position of the labourer must be positively comfortable, and decidedly better than "in the most high and palmy state of agriculture." Why wages are so much lower in some counties than in others, is a problem upon which it is unnecessary to enter, and which I am unable to solve.

Even under the most generally favourable circumstances, however, the labourer cannot maintain himself in his old age. In the days of failing strength he must have recourse to parochial aid—a melancholy conclusion to a life of hard and honest industry. Under existing circumstances, farmers, the employing class, are more or less under the necessity of economising labour in the culture of their fields, or, through a mistaken principle, they will not drain, or execute any of those permanent improvements which would increase the quantity and value of their agricultural productions to a degree at least commensurate with the amount of expenditure. If, however, the land could be relieved of its burdens, the farmers would have it in their power to employ labourers on terms more favourable to both parties than at present. This may appear a truism, yet it may require some illustration.

According to the present operation of the Poor-law, both as regards the employed and the employing classes of agriculturists, the latter are under the alternative of providing work for a certain number of labourers, or of contributing towards their support in the workhouse, therefore they think it expedient to employ old and feeble labourers with large families, who would otherwise be employed to take refuge in the house, in preference to able-bodied active men whose services they could hire at the same wages—nay, employers may find it their interest to pay more to the former than to the latter class of workmen. There is palpable injustice to one party, and disadvantage to the other. The farmer thus pays a higher price for less labour; the pressure of the Poor-law, as it now stands, leads him to act thus, in a manner evidently opposed to the ordinary, common-sense mode of dealings between man and man: and on the other side, the able-bodied man, whose muscle, and sinew, and energy are his capital, does not receive an equitable remuneration for the exertion of those physical powers with which Providence has gifted him. It is no satisfactory reply to say that charity prompts to the employment of those persons who are encumbered with families, however inefficient workmen they may be, in preference to young unmarried men; but justice, and proper economy, as exercised in labour transactions between master manufacturers and their operatives, in which payments are regulated according to the quantity and quality of work, demand that an analogous system should be pursued between the farmer and his labourers.

Your correspondent, "S." (June 23d, 1849) has stated this point in very forcible language. I beg permission to reintroduce here a few paragraphs from that gentleman's communication. "Suppose a labourer marries and has a family of some half-dozen children, he gets 9*s.* a week, with some other privileges, such as

a cottage and garden, with an allowance of fuel, and all this little enough to support him with any degree of comfort*; but then he is a slow and careless workman, requires constant looking after and keeping at his work: and another works on the same farm, is not married, requires no cottage, and is not supposed to require so much wages; he is an active and industrious young man, wishes to prove himself superior to his fellow labourers (an ambition that ought to be stimulated); but the system is too general of not paying according to merit, but according to the necessity of the person, and those who would render themselves active and trustworthy, are not rewarded as they deserve. It may be said, 'this is an evil that, under present circumstances, cannot be overcome, because the married labourer must be supported some way or other, and as well give it to him in the shape of wages as otherwise.' But this degrades the labourer from the condition of a free and independent being, disposing of goods (his services) on honourable terms, to that of a mean and despicable serf, dependent on the alms of those who employ him; and for these he is bound to render, not value for value, but what he can, or what he may be compelled to do. But not only is such a system a barrier to exertion among the labouring class, but it is positively productive of evil; for, small as it may be in the eyes of the acute and the intelligent, yet it is in too many cases an inducement to young men to contract improvident marriages; for they know that they must be kept from actual starvation whichever state they live in, and they are certain that no exertion on their part can raise them above their present condition, or, at least, from the view they take, no chance is perceptible."

Now, "this evil which, under present circumstances, cannot be overcome," would, I am disposed to think, give way, if farmers were exonerated from the heavy pressure of land rates; for, in such case, they would be free to select the best workmen, and pay them by piece-work, in all convenient cases, which would be the most convenient mode; and under improved circumstances they would find it their interest to employ a greater amount of labour on their farms, while, on the other hand, competition for labour would render the labourers more expert and industrious; and failing or almost worn out labourers, though not selected for hard days' work, would have at least equal claims in competition for piece-work suited to their strength and skill. It would be no injustice to them that other men, who could execute more work in a given time, should receive more wages.

A preliminary as regards the correction of the present irregularity in dealing, in this respect of remuneration with labourers, is to lighten the pressure of poor rates upon the land. Instead of generalising on this point I shall adduce some parochial statistics, from which I think I can show how the rates may be lessened throughout the kingdom.

The agricultural parish in which I reside contains 7000 rateable acres, of which the rental is valued at 9000*l.* To this is added 2176*l.*, the estimated yearly value of houses, land, and railway making, the total rateable property 11,176*l.* To this parish belong 670 acres of unrated commons, in different localities. The population by the last census was nearly 2700, but it is actually more, having received an additional impulse from the influx of families evicted from neighbouring parishes. The parochial poor reports show that during the week ending October 25th of the present year—and this has not been a period of local distress—there were in the district union house 75 individuals at the weekly cost of something under 2*s.* 6*d.* each.

This amounts in the year to	£487	10*s.*
256 received out-door relief at an average of 1*s.* 6*d.* each per week for the year ...	998	8
	£1485	18

The indispensable charges for medical attendance, relieving officer, collection, &c., have raised the amount of rate to 4*s.* 6*d.* in the pound.

Now I think that in this parish (and *ex uno disce omnes*) the above sum might be considerably reduced.

I have already stated that there are 670 acres of commons in different parts of the parish. Of these a portion is about to be enclosed and appropriated according to the several rights and interests of the proprietors and occupants of the adjacent farms; and this land, which has hitherto been of little value to the poor neighbouring labourers, who have neither cows, nor sheep, nor horses, nor donkey, nor always even swine to graze upon them, and to whom the advantage of a little fuel in the form of peat sods stripped from the surface, to the injury of the staple soil, or stunted Whins, has not been equivalent to the benefit they will derive from employment in enclosing and cultivating the new land, will afford a constant source of additional employment. Some acres of it, too, are to be let out in allotments to the local poor, who will still have the liberty of ranging over a large unappropriated tract, and denuding it of its surface, if they be so disposed, until the extravagance of leaving it—even though it be of gravelly soil and shallow soil—shall have become apparent to the public. These allotments (with others let out at rents near the populous village already referred to) will have some effect in relieving the pressure of rates, though they will be insufficient to cause much perceptible diminution of them.

I would first suggest, then, as a certain means of lessening the poor-rates, an enlargement of the allotment system, and a different modification of it. As affects the labouring poor chargeable on parish rates, I would have a certain quantity of land—and this would be a favourable period for obtaining it on lease—rented for labourers in different localities of this parish, which I have taken as an illustrative case.

Suppose 20 acres to be taken, at 2*l.* per acre, for our purpose. Of the 75 individuals in the poor-house, maintained at the expense above stated, 20 would be able to cultivate from half a rood to two roods. Supposing these persons to leave the union-house, and receive out-of-door weekly relief to the amount of 1*s.* 6*d.*, and a quarter of an acre on an average each, there would be an annual saving on this account of 52*l.*; there would remain 15 acres to be appropriated. These might be divided into portions, from 1 to 4 roods (according to the means which they might possess of cultivating them), among such of the 256 recipients of out-of-door relief, or others likely to become heavily chargeable without timely succour. By thus aiding them I calculate that one-third of the sums now given to each individual for maintenance would be cheerfully surrendered for the possession of a free allotment. The saving on this head would be, on an average, 6*d.* a week from each of the 256 individuals, which would amount to 332*l.* 16*s.* per annum. The account, then, so far, would stand thus:

Saving on 20 paupers	£ 52	0*s.*	0*d.*
Saving on 256 paupers	332	16	0
	£384	16	0
Deduct rent of 20 acres	40	0	0
	£344	16	0

This sum of 344*l.* 16*s.*, deducted from 1485*l.* 18*s.*, leaves 1141*l.* 2*s.*

Some very deserving families ought to have prize portions in addition to the ordinary lots, in order to reward them and stimulate others to the exercise of skill, economy, and good conduct. And in the annual apportionment of these free allotments (subject, however, to nominal rent, for obvious reasons) which I believe would be eagerly sought, certificates of good character signed by a clergyman, the relieving officer, and a magistrate, should be required from the applicants.

To the difficulty which naturally presents itself, viz., that the recipients of parish relief in its present form would not voluntarily exchange 6*d.* a week for a portion of land of much less value in the market, I reply that the facility which the occupation of even half a rood of land of the ultimate value of 10*s.* would afford for keeping a pig and some poultry, would be an important element in the estimation of those persons, and would render the allotments equivalent at least to the money surrendered on obtaining them. The pleasure, too, of having a healthful mode of employment would have great influence on many minds; and liberation from the union-house would decidedly be considered cheaply purchased by the proposed substitution. The quantity of productions which a well conducted rood or two of prime land would yield, would go far towards the support of a single man, or of even one with a wife and child. The moral benefit gained by such a system, if generally acted on, would be incalculably great.

We have already reduced our amount of parochial taxation from 1485*l.* 18*s.* to 1141*l.* 2*s.* But this sum is, I think, capable of farther diminution.

A parish heavily burthened like this in question, for the support of poor persons living in a populous village, while other rural parishes are very lightly taxed, because thinly peopled, should be relieved of the unequal pressure. A remodification of the present system of rating, so as to equalise the pressure of it, would probably reduce the sum of 1141*l.* 2*s.* by one-third, viz., to a fraction over 761*l.* And if this sum were expended in additional labour, or higher wages, the relief thereby afforded to labourers would be very considerable.

The arrangement of suitable machinery for a new system, framed on the principle of equalisation of rates through very extended districts would be simple. A district treasurer, suppose a collector of inland revenue, might receive and transmit half-yearly to the treasury the sums collected for him, and the treasury should, in such case, issue the sums necessary for the maintenance of the poor.

But I have not concluded the calculation yet. There are several hundred acres of commons within a radius of four miles from the village in which I live, which might be turned to profit. Any one competent to judge of the qualities and capabilities of land, and who may have seen what the industry and economy of the Belgians have effected in some parts of their country, where sandy heaths (in which vegetable mould was first generated by sowing Fir seed, which, becoming trees, furnished, through the deposition of leaves, sufficient soil to induce cultivation) have been rendered fertile, would at once perceive that the commons to which I have been adverting are much more capable of culture even in the worst portions. The social good which would result from enclosing commons throughout England, according to local requirements, would, in a moral point of view, be still more important than the pecuniary advantages that might ensue. The profit, I readily admit, is too problematical, especially under the present depression of agriculture, to induce their culture by private enterprise. But if commons generally were connected with large district poor-houses, they would afford a valuable field for the application of that labour which is now so frequent a wasted or unapplied power. A well organised system of field-labour might not only be made a means of social benefit, by drawing forth the latent productions of cultivable, but unworked lands, and making them experimental and model farms, and also by training juvenile paupers to habits of the best agricultural practice. Judging from what I have seen respecting families who have squatted on commons, apart from a church and school, and effective control of any kind, I believe that commons have proved to be an evil of great magnitude. A population springs up there, of whom a large portion live without God, desecrate the sabbath, absent themselves from the parish church, or regular dissenting chapel; or if they have religious impression, assemble in congregations as Latter-day Saints or Ranters. The poor colonies in Holland show to what an extent lands cultivated by the poor may be rendered self-supporting.

But the culture of the best land procurable in the neighbourhood of the present poor-houses, would be the most directly beneficial; and I am within bounds when I estimate that the saving which might be effected by the annexation to them, would reduce the rates, and thereby relieve the farmer, so that he might give his labourers more employment, and on more favourable terms than it is in his power to afford at present.

I must, in conclusion, advert to a matter in which many farmers act ungenerously to their cottagers. They selfishly refuse them the privilege of keeping pigs or poultry, lest they might be tempted to pilfer corn and Turnips to maintain them. This is a cruel restriction, and unworthy of any benevolent man. In truth, it is an unwise and profitless economy to limit the means of the labourer too strictly.

I cannot conclude these hasty and, I fear, ill-arranged and otherwise also imperfect observations, better than in the words of your correspondent "Falcon," relative to the last point on which I have treated:—"The screwing system is bad policy, and such parsimony brings its own punishment. In my limited experience, I have always found it advisable not to cut down wages to the lowest figure for able-bodied men. The addition of 2*s.* per week is amply repaid by the energy and spirit it infuses into the frame of the labourer. He appears to dig and delve with pleasure, compared to the man who is continually pulling against the stream, and knows that at the end of the day his task has neither been profitable to himself, nor to his master."

"Blessed is the man that considereth the poor."

M. D.

* No such privileges in my neighbourhood.

ON THE CULTIVATION OF OATS.

No plant of the cultivated sorts is adapted to a greater variety of soil than the Oat; the crop is raised with much ease on almost every kind of land, from the heaviest loam to the lightest sand, and consequently a place has been occupied by it in almost every rotation of crops. Before agriculture had been subjected to general rules, the result of long experience, and the land was often sown as long as any return could be obtained, before any means of recruiting it with manure were thought of, the last crop was generally Oats, as it returned an increase of the seed, beyond any other cereal plant. Then as the land did not any longer repay the labour of ploughing and sowing, the cultivation was abandoned, till some renewed fertility was produced by the time in rest, and by the decomposition of roots and weeds. It is supposed that the Oat draws much nourishment from the soil, and consequently very much exhausts the land, and many farmers are induced by this consideration to buy, rather than grow the Oats for the use of the farm. This plan may be judicious where the soil is very rich, and adapted for the production of Wheat and Barley, but a general rule directs the home consumption of Oats to be raised on the farm, rather than trust to a fluctuating market. With proper management, a crop of Oats will give as great a profit on the best land as any other crop, when it is considered that it requires less manure, and produces an abundance of straw, which is very fit for the winter food of horses and cattle, especially when aided by roots or other succulent food.

The success of a crop of Oats depends, as every other crop, on the preparation and manuring of the land. The sowing of culmiferous plants in succession is now universally and justly exploded from every improved and economical system of cultivating land. The soil is rendered hard by such a course, and exsiccated by constant exposure to the influence of heat and drought. Universal practice has placed the Oat in the first place of the rotation of crops, beginning the course from the state of Grass, whether it be of short or long duration. Several varieties of Oat are cultivated in Britain, of which the qualities are so similar as to make no difference in the necessary cultivation.

The common white Oat is most suitable where the inhabitants live much upon Oaten cakes.

The red Oat is hardy, gives good increase, but the straw and the grain are coarser than the white varieties.

The blue and grey Oats are weak and unproductive.

The Poland Oat is plump in the grain, but very thick in the skin. The grains are mostly single, have no awn, and the straw is short; it answers best on dry warm soils and situations.

The Friesland or Dutch Oat affords more straw, and is thinner skinned than the above mentioned variety. The grains are mostly double, the larger one sometimes awned, with the awn placed high. It is now little used.

The Siberian or Tartarian Oat has been reckoned a distinct species, each flower frequently containing three perfect florets, never less than two, with a pedicelled rudiment of a third; the panicle is unilateral, and differs from all other varieties; the grains are thin and small, the largest awned, the small ones awnless, the

straw is tall and reedy, and of course not so valuable as fodder. This Oat gives much the largest produce on inferior clay lands, but the quality is inferior.

The Essex short Oat is very plump, and is gifty in the produce—the straw is short and thick.

The Potato Oat is very heavy and yields largely; the straw is strong and reedy, and is generally preferred in all tolerably mild situations, as it stands upright and does not fall down and lodge so readily as the weaker stems, and the reedy nature of the culms suits as an open bed for Grass seed when sown on a green crop fallow. The meal of the grain, though more abundant, is not so fine in quality, as that of some other varieties of Oats. The plump grain is very apt to be shaken from the husks by the violence of sunny winds in high and boisterous latitudes.

Universal practice has now fixed the Oat as the first crop of the rotation, or the plant that is used on the Grass furrow of any age, whether of a permanent pasture, or of one or two years in duration. Green crops thrive better when cultivated from an Oat stubble than after any other culmiferous crop—and from whatever cause it may arise, the fact is certain. The land to be sown with Oats must be ploughed in the early winter, and best in the months of November and December. To grow abundantly, Oats require a rich adhesive soil—but they also yield fair crops on inferior lands that are judiciously cultivated. All lands are benefited by early ploughing; tenacious soils are mellowed by the action of frosts and thaws, and light lands are compressed by lying during winter for a considerable time before being sown. This compression is very necessary, in order to exclude the drought, and a firmness is required in which the roots of plants will be fixed. This very necessary property in all fertile lands is much promoted, in the case of light soils, by means of the land being ploughed in the early winter, so that the furrow slices sink and become firm from the state of rest. Moisture is also acquired and retained by reason of the quiescent state of the land in the spring.

The month of March is the general season of sowing Oats over the greater part of the British Isles. Some situations are earlier, and admit sowing in February; and others are later, and protract the season over the month of April. The light brown colour of the land gives the indication of the proper state of the soil, when the seed is sown broadcast on the surface by hand, and covered by the harrowing of the surface. The seed in bags is laid in a row across the fields, and at distances between the bags as the quantity of land may require. When the field is of much length, two rows of bags will be convenient and necessary, and laid at equal distances between the rows, and from the ends of the field. The wheels of the carts that convey the seed to the field will make ruts in the passage across the land, into which the seed will fall, and form an unsightly row of the braird. It is therefore preferable to carry to the field the seed as it is wanted to be sown, on the back of a horse guided by a lad, who lays down the full bag in advance of the sowers, and picks up the empty ones behind them. For this purpose, the seed in bags may be placed in carts outside the gate of the field, and hence carried to be sown on the back of horses. The sowers walk abreast, and receive a supply of seed in passing the bags, which is given them by the person appointed for the purpose. Two pairs of common harrows follow the sower, and cover the seed by a double tine, or by passing twice over the same ground. This operation is called "breaking in" the surface, and is followed after the sowers, till the field is all seeded. A double tine of the harrows is next applied in a straight line across the field, which effectually breaks down the crown of the furrows, and completely covers the seed. The finishing process is done by a double tine lengthwise, or along the plough furrows, which suits and pleases the longitudinal direction of the eye rather than the cross harrowing. On fine lands, a single tine done longitudinally will often be sufficient. In some cases, the water furrows are drawn by a one-horse plough, and the headlands are cut by gaws or open passages for the water to escape into the ditches.

In order that the cross harrowing of the land may produce the greatest possible quantity of alluvium, or of finely comminuted particles, being the matrix in which plants of every kind are seen to grow with the greatest readiness and vigour, the furrow-slices must be very sharply cut by the coulter and share of the plough, and laid over at such angle as will place the comb in a thoroughly perpendicular position.

The seeds being regularly scattered by the hand over the ploughed surface lying in the above form of furrows, the cavities receive the whole quantity, which is prevented from sinking to the bottom of the furrows by means of the slices being closely pressed together by the mould-board of the plough, when laid over by the turning power of that appendage. The height and narrowness of the combs of the furrow slices form the chief excellence of the land that is ploughed for Lent crops, and the depth of the interstices becomes a secure bed for the seed in the hollowness against damage from frosts, and from the winged vermin that infest the newly-sown grain fields. An easy action is presented to the harrows in breaking the narrow combs by the process of cross harrowing, which fills the cavities, and covers the seed with a quantity of fine alluvium, that receives and retains moisture in the proper quantity and degree, and also affords a matrix of intimately comminuted particles, which gives to all young and tender germinations the necessary pabulum both in kind and quality, until the organs of the plant become stronger for the reception of proper substances. It is this preparation of alluvium which yields as good a braird of Oats on poor lands as on rich soils, and which continues until the necessary supply of food fails to be supplied by the former, and is given in more abundance by the latter. In either case of soils it is essentially necessary that the alluvium be produced by the above mentioned modes of ploughing and harrowing the land. The alluvium supports the tender germination of the seed till the roots penetrate the firm furrows that underlie the surface, where they find the very agreeable products of the decomposing herbage of Grass, than which no materials can yield better food for plants; consequently the abundance of a crop of Oats will mainly depend on the quantity of Grassy herbage that clothes the surface of the ground, and which is prone to decay. Early ploughing of the land favours this decomposition, which will be partially commenced by the time of sowing the Oats, and will thus be ready to afford a prompt and effectual aliment to the young and tender germinations.

About the time of the Oats being fully brairded, but not grown strong, the land must be rolled with a weight of one ton, and done across the field, as the sides of the furrows are completely hit by this method; and by rolling longitudinally, the roll will reach over the furrows or not strike the sides at all. And as the breadth of the ridges may not be an exact multiple of the width of the roll, time will be lost in going along without the full breadth of land being covered and rolled. The cross direction of the work removes these objections. This rolling is beneficial in closing the surface of the ground against the attacks of drought—in fixing the roots of the plants firmly in the ground, and in levelling the cloddy surface for the action of the scythe that may be employed in mowing the crop. On dry soils a repetition of the operation will be attended with useful effects, when the weather proves very dry, or insects are seen to vex the plants. In many cases the land cannot be too much rolled.

Before the second growth of the Oat plants overshadows the surface so completely that no objects can be seen, persons provided with clippers walk in the furrows, and cut or pull all tall weeds that may appear, as Docks and Thistles, or they walk at distances that are within the reach of the arm to stretch over the width. By this means no weeds can escape being seen and cut.

In cold latitudes, and under wet and late climates, Oats are sown on the green crop fallows in the place of Barley, after the Turnips are removed. The land is ploughed with one furrow in March or early in April; the seed is sown in broadcast, and covered by three or four single tines of harrowing. The rolling is then done across; the Grass seeds are sown on the level surface, and covered by a single tine of the light harrows. The water-furrows are carefully drawn by the double mould-board plough, and open cuts are made to conduct the water through the headlands into the side ditches. When the plants are rising into the second growth, the weeds that have appeared must be pulled or cut in the way that has now been mentioned. As the Grass seeds that are sown will in some part be allowed to rise into hay, the extirpation of tall weeds becomes doubly imperative, that no deformities appear among the Clovers, which form the finished result of the labours of fallowing.

So soon as the husk of the Oat grain is wholly filled, and when the straw in the neck of the stem, on the slender part immediately below the head, has become white or strongly inclined to that colour, the crop may be cut with advantage, without waiting the ulterior stages of maturation. When cut in that state, the meal hardens gradually in the husk, and becomes whiter in colour and finer in quality than if the dead ripeness was allowed to communicate from the root to the stem the incipient decay that happens in every vegetable growth after maturity has been attained. A coarseness is attached to the deadening relaxation of the enlivening juices, and as the stagnation first takes place at the root, there is time to cut the crop before the communication reaches the head of the stem. The mealy quality of the seeds of every culmiferous plant is improved by the early cutting, and there may not be any diminution in the size or weight of the pickles, merely by allowing the husks to be wholly filled, so that a hardening of the meal takes place after the crop is cut, but no shrivelling or shrinking of the size of the kernels.

The cutting of the crops of Oats is done in two ways—by the sickle and by the scythe. Bands are made by twisting together two handfuls of the stems, which are laid on the ground and fitted to the size of a sheaf by placing in them the successive cuttings done by the sickle in the right hand. The sheaves are then tied, and set into shocks of 12 sheaves, and very commonly with two placed on the top as "hood" sheaves. These sheaves are so placed for the purpose of keeping dry from rain the heads of the sheaves that stand upright and form the shock. In this state, the crop remains on the field till the sheaves are sufficiently dried to be carried to the farm, built into ricks, and afterwards thatched with straw.

When the crop is cut by the scythe, the swathes lie for some few days exposed to the drying effects of the rays of the sun, and are then turned over in order to make both sides alike in dryness and state of tendency to become ready for being stacked. After both sides have been equally exposed, the swathes are tied into sheaves, set into shocks, carried to the farm-yard, and treated as above-mentioned when cut by the sickle. This method supposes dry lands and early climates.

The grain of Oats is very easily separated from the straw, and the process is at once accomplished by the scutchers of the common threshing-machine. The awnless grain falls into the wire-hopper of the farming-machine that is driven by the threshing power, and comes to the floor of the barn in a half cleaned state. The straw is carried over two revolving rakes into the straw barn, in which it is stored for use. The grain is passed through another farming-machine that is driven by hand, which separates the sound and the light grain, and is then ready for sale and other purposes. Oats are also threshed by flails on wooden floors, parted from the straw, and winnowed for use as above-mentioned.

The chief use of Oats in Britain is for feeding horses, and often with a small mixture of Beans. For this purpose no equal substance has yet been found. An average quantity to be given weekly to a farm horse may be stated at 2 bushels. In Scotland and the northern counties of England, the meal of Oats is very largely used as human food in two ways—in being made into porridge or hasty pudding with water and milk, and baked into thin cakes on a flat iron girdle. Both these preparations are very nutritious as food, as is very amply shown by the ruddy complexions and the robust and healthy bodies of these northern people. Probably the coolness of the climate may have very considerable influence in modifying and correcting the commonly understood heating property of the Oat grain, and the force of habit will very much help to continue any old-established custom. The most recent analysis of Oats, by Dr. Christison, of Edinburgh College, gave in 100 parts—72.8 of starch, 5.8 of saccharo (mucilaginous extract), 3.2 of albumen, 11.3 of lignin (bran), a trace of oily resinous matter, and 6.6 of moisture.* From these constituents it would appear that Oats are much less nutritious than Wheat, though, according to Boussingault, the difference is but small. Whatever may be the chemical merits, experience proves that Oatmeal forms a very substantial diet to the inhabitants of North Britain, and that no inconvenience is experienced with good digestive organs, and a proper amount of vigorous exercise, from the supposed tendency of the food to become ascescent on the stomach. A very common character of Oats is in being the food of horses in England and of men in Scotland, and the rejoinder has been made that nowhere can there be seen such horses and such men.

The best quality of Oats is produced in Scotland and in Friesland, where the soils are loamy and partially adhesive, and the climate cool or moderately warm. There is no doubt that climate exerts a most powerful influence on every form of vegetable growth, probably more than the soil in which the roots are fixed. Oats require a very considerable amount of moisture, and a protracted season of growth; consequently they are not grown in hot countries; and even in South Britain the straw is short, and the pickles are puny, and the produce is small, by reason of the early climate hastening the premature maturation. But very much of the success of the cultivation of Oats in Scotland arises from the rotation, which is almost universally adopted, in the land being laid two or three years in pasture after the crop of hay has been got in the first year from the Grass seeding of the ground. During this period of rest in pasturage, the land is consolidated, and is further bound together by the numerous fibres of the roots of the Grass plants, which are very thickly interlaced, and serve to bind the natural looseness of any soil. The leaves of the Grasses fall upon the ground and are decomposed in the undergrowth, which the mouths of the grazing animals do not catch. When the land is ploughed and sown with Oats, the leaves and the roots are decomposed, and afford food to the growing plants; and experience has most fully shown, by the ample evidence of daily proof, that no manure yet known can be compared with decomposing vegetable matter, both for the property of quickness of action, and for the durable effects. The soluble parts are quickly available, and the earthy substances remain for gradual decomposition, to add to the staple of the soil. It is wholly undeniable that the splendid crops of Oats and Turnips in Scotland are very mainly owing to this vegetable freshness, arising from the rest of the land in the pasturage of Grasses by animals. At the same time it must be freely admitted that both the soil and the climate of that country are peculiarly favourable to the growth of Oats, and more so in the middle northern parts than in the southern counties, except where the soil is rich enough to outstrip the influence of circumstances; if not wholly, in a very considerable degree. On the other hand, it may be stated to be quite certain that the introduction of the rotation into the southern counties of England, by which the land is pastured for two years, would very much increase the success of the cultivation of Oats, and also convey much benefit to the following crop of Turnips, in the way that has been mentioned. This allusion more specially comprehends the inferior soils, as the richest lands will produce a crop of Oats by the intrinsic qualities without the adventitious aid of the vegetable sward. But even in these cases one year of pasture will much increase the chance of success. For this purpose all permanent pastures of the best secondary quality and downwards must be put under arable cultivation and subjected to the rotation that has now been mentioned.

* On this subject, a Report by Professor Norton, in the Highland Society's Transactions, should be studied.

The quantity of the seed of Oats sown on an acre of land may be averaged at from 3 to 5 bushels, and the produce varies from 5 to 10 quarters per acre, exceeding the latter figure in some very particular cases.

In France and Germany the practice gains ground of baking the meal of Oats and Rye into loaves for horses' food, and is said to be a very evident saving of provender. In dry hot climates the straw becomes very dry, from the early ripening that is forced by the climates; but in the northern parts of Britain, where the Oats are the chief crop, the straw retains a greater quantity of juice, and in many cases it becomes of much value as fodder for horses and cattle. This is the effect of climate, and is often much assisted by setting the crop in single sheaves that are tied loosely, and when they are dried and seasoned by the sun and wind, the sheaves are tied firmly in the usual way, and placed in shocks. In late harvests, and where the crops are unequally ripened, very much advantage is derived from this method; the crop is sooner ready for the rick-yard, and the straw retains much of the natural sap, to improve the quality as fodder for the animals of the farm.

The Oat is a hardy grain, and is suited to high latitudes and exposed situations, more than any other culmiferous plant that is known. It is less affected by the frosts of spring, and less damaged by the rains of autumn, than Barley; the bulk of straw is much larger, and the return in grain is more valuable, as the greater quantity of the article compensates the difference in the price, that of Barley being generally one-half more than of Oats. Except for the purpose of thatch, the straw of Oats is the most valuable of the culms of the farm, and the harvesting is always the least expensive.

Home Correspondence.

Mr. Mechi's Lecture.—Mr. Mechi states that he has a boy at his farm, whose *sole* occupation it is to groom 30 bullocks, and that it only costs one farthing a bullock, per week. In this part of the world we are not fortunate enough to find a boy, of any capacity at all, at 7½*d.* a week. Surely the great empiric has made a *lapsus linguæ* here. Perhaps he meant to say that the boy groomed the 30 bullocks, 60 calves, and 10 cows, and that it only cost one farthing a head, per week, to give each of them a rub down. One hundred farthings are two shillings and one penny. If the boy worked hard for 10 hours a day, he would be able to devote about six minutes to each of the 100 animals. Now, considering that these lie upon boards, without any straw, I will leave it to any practical man to say what good a six minutes' rub, from a boy worth only 2*s.* 1*d.* a week, is likely to do either cow, calf, or bullock. If the rest of Mr. Mechi's "sure it pays" are worth no more than this, God help the people that pin their faith upon him. *W. G. D.*—I would recommend your correspondent to have each bullock curry-combed and brushed along the back and sides for *five minutes* daily, by a stout lad, and he will arrive at a sufficient conclusion as to my meaning and calculation. The animals are always clean on the open boarded floors; the brushing is merely to stimulate the action of the skin, and remove its natural exudations—there is no dirt to remove. *J. J. Mechi.*

Allotments.—In the correspondence on the allotment system in your last Number, there is in one of the communications an error in the wages received by the two individuals represented as "C." and "S.;" they each had 16*s.* a week wages; it is misprinted 10*s.*, which makes a serious difference. I am truly glad to find one of your correspondents advocating gardens to the cottages. I am in the same boat with him. My cottages for the workmen have each a good-sized piece of ground to them, which I consider better than having the same quantity more or less at a distance. Your indulgence has also exhibited another important fact, viz., that the same correspondent is, at the same time, trying to elevate the men in the scale of being. He is endeavouring to educate them, and if right principles are inculcated, no doubt he will reap a harvest of good, and others also will enter into his labours. *Justitia.*

Smithfield Club.—I send you an extract from Lord Hardwicke's speech, which seems to me to deserve a place in your columns, as it criticises the mode in which the prizes of this club are awarded. His lordship said:—"I have been an exhibitor, and have had the good fortune to have a medal awarded to me. I thank the society for it, though I should have been better pleased had I received that medal more in conformity with my own views relative to the experimental fattening of cattle, than the system which is generally adopted in this country. The plan which I would adopt should be of a different character, though it is one more difficult, perhaps, to carry into operation. I consider that in bringing up animals to compete for a prize, the intention is to show that race and that breed which is the easiest to fatten; and that the present method does not show that at all. You do not really know how the animal has been fed, although it is stated so and so. You do not know how long it has been fattening; whether from infancy, for the previous six months, or any other period. You do not know its positive quality nor its age for a certainty. If you are to run a race of this description, it is my opinion that the animals to be fatted for exhibition should be inspected in their lean state, that their condition and breed should be made known, and that the fattening process should begin from the same date, and the animals be shown at the same period of time. You would thus early discover which has the best blood. At present, manage it as well as you can, I deny that the result is satisfactory, or that the contest is just or perfect."

Chaff Cutting and Oat Bruising.—In your number for December 7th, a correspondent at Chorley has given his experience of "Chaff Cutters and Oat Bruisers." He "bought those implements and used them some years because everybody else did;" and he "doubts whether both are not positively wasteful." He will "be glad if he can provoke discussion in your columns." Permit me to say my experience of those implements is altogether the reverse of his. He has not stated the number of "years" he tried them, nor the way by which he arrived at his astounding conclusions except the increased "gaiety of a young horse." He "watched the horse and the stable man more closely." It not unfrequently happens that the parties having the care of cattle are much opposed to any innovations upon their system, and they can generally thwart the efforts of those who introduce them; thus showing the necessity of parties who wish to introduce anything new, taking care to superintend very closely for a short time the conduct of any experiments they wish to make; better still if conducted by themselves. I have, Sir, been using the "Oat bruiser and chaff cutter" for nearly 30 years, and I know full well that if anything is wrong with either of them, my pocket at once suffers an increased draught to the extent of one-half at the least. I will explain. The hopper of the bruiser holds a bushel of corn (whole), the rollers are set to work, and in a few minutes that same bushel is re-measured; it is found to have increased in bulk at least one-half, but if the corn is well crushed, it will measure three-fourths more in bulk than when first put into the hopper. This of course applies to quarters, or hundreds of quarters in the same ratio. And after many close experiments with the crusher, either by my own hands, or under my inspection and direction, I conclude, the least saving in the consumption of corn is one-half; because, by giving the animals (not horses merely) the same quantity in measure of crushed corn they were accustomed to receive of uncrushed (the work being equal), they will keep in better condition—their fæces will not be composed of one half of whole corn, sufficient to fat all the poultry or sparrows, if they abound, in the yards. But Sir, to speak with confidence, there must be personal inspection of these things; and if your correspondent continues incredulous I would request him to have collected some of his horses' droppings, to dry and sift them, nnd then sow the corn that remains, and he will find in a short time a luxuriant green crop on his land. What I wish to impress is the fact, that all that the various animals swallow of corn that is unbroken is worse than useless to them; they do not derive the smallest nutriment from it, and have wasted their saliva and gastric juice in merely swelling and softening the grain. If cattle should ever be found with gizzards, then give them whole corn, and spare the time employed and expense incurred in crushing it for them. I have tried it with cows, beasts, and pigs as well as horses, and with the same results from any grain—Beans, Peas, Barley, Rye, and Wheat, as well as Oats; it must be so; reason and facts settle the question, where the practice is fairly tried; but to do this requires more attention and labour than many will give. Let not the implements have an ill name. Perhaps some may imagine I have an interest in the manufacture of these implements, I beg to assure any such I have not, either directly or indirectly. The cutting of hay and straw I am of opinion effects a saving to nearly the same extent as crushing of Oats; and I must, ere I close, refer to the great difficulty there is in overcoming prejudices when early imbibed. I was in London a short time since, and called at stables where I had put up for many years. I enquired of the proprietor how his stock went on (I had, after several years' attempts, induced him to put up power and crush his Oats and cut his chaff). He replied, "Very well indeed." "You have now found what a great saving it is, said I." Mark the reply. "No, it is no saving, but my horses look a great deal better, and do their work better." "Well then that is a saving; but I fear you have not calculated?" "No, it is no saving, but they work much better and do more of it. Why, I have been able to take upwards of 1500*l.* more job work than I did; but I do not see that is any saving." He could not see with my eyes, and I left right glad that I had persuaded him to try the practice; and in 3 or 4 years such was the result. I can understand the party consumes nearly as many quarters of corn as he did before; but if in a year he can do "upwards of 1500*l.* worth more work," it appears to me he has just saved the 1500*l.* without an increased outlay. If I am mistaken some of your correspondents will correct me. I apologise for the length of this; yet would endeavour to induce proprietors of live stock to give themselves no rest until they have in use "Oat crushers," and "Chaff-cutters." The owner of a single horse can save the expense of the hand machines in a few months. They cannot possibly be too strongly recommended. I beg to add, that wherever the crushers are purchased, the makers should spare no pains to instruct the parties in their proper use and means of adjustment. I have been surprised to see how little acquainted some persons are with the right use of implements; I have seen the rollers screwed up close at one end and open a quarter of an inch at the other, or open altogether wide enough to permit Peas to pass through uninjured, and the complaint was, "the Oats were not better after they had been put through, nor was their bulk increased." Very wonderful, indeed! Let the practice be fairly tried, and the results will be most satisfactory. *Baddow Park.*

Societies.

Highland and Agricultural, *Nov.* 20.—(*Concluded from p.* 782.)—*Substances which can be most profitably employed as Auxiliary for Turnips, in fattening Cattle and Sheep.*—Mr. Russell, Kilwhiss, Fifeshire, said: In complying with the request of the Directors to give my experience as to the substances which can be most profitably employed as auxiliary to Turnips in fattening cattle or sheep, I think the subject will be best treated by considering it, in both the objects I have in view, in consuming the Turnip crop upon my farm. On the one hand, I would endeavour to realise the greatest return from the Turnip crop, when fed on the farm, independent of the manure. I have often heard it maintained that more will be made from the Turnip crop per acre, when nothing else is given to the cattle or sheep but straw, and that the use of oilcake or grain will leave less return, after their cost is deducted. I must say that I have arrived at a different conclusion; but the experience of individuals will, no doubt, vary as much on this head as in most other matters of farm practice; for Turnips, like the Grasses, are the best tests of the stamina of the soil, as their nutritious qualities are well known to be so dependent on the character of the land on which they grow. A given weight of roots will produce much greater results in one case than in another. The quality of roots is very inferior on my own farm, and I very rarely give Turnips to any kind of stock without [a little cake or corn. But, on the other hand, as I am far from any town to obtain manure, enriching the farm-yard dung through the addition of extra feeding stuffs, has an important bearing on the subject which has been chosen for this day's discussion. It is one of the most firmly established principles in the whole system of agriculture, that the more nutritious the food of animals is, the more valuable will the manure be. In Fifeshire, artificial food has hitherto, in general, been given, rather with the view of obtaining a greater return from the green crop, by using it during the last stages of feeding, than with the intent of relying on the increased value of the manure, and trusting to be compensated indirectly. At present there are no grounds to believe that much increase in the produce of our fields will be profitably or permanently maintained without an increased herd of stock being kept. Notwithstanding the great benefits which have resulted from the introduction of a vast variety of artificial manures, which often produce extraordinary effects in the first steps of agricultural improvement, the home-made will always be the sheet anchor upon which we must rely for success. In the one case, you will more likely have the main elements of nutrition, upon which the healthy growth and maturing of plants are dependent, than in the other, where an undue development of certain organs is often not followed with anticipated results. The after condition of the land, when large crops have been forced under the different systems, is a most important matter, and becomes very marked where the soil is of weak staple. At the present time might be distinctly seen on my farm the great advantages of rich, box-made manure, which was applied to the root crop in 1847, when contrasted with what was only dressed with superphosphate of lime and guano, although the land has been two years in pasture; these facts, and many others which might be adduced, are not to be lost sight of. It becomes a matter of primary importance to many of us in the rural districts to endeavour to consume as much extraneous food, or the less valuable grains on our farms, as possible, in conjunction with the Turnip crop, without realizing less money for it per acre. I think we ought all to aim at this point at least. As I increase the extent of my autumn crops, or sow the spring crops earlier, the more is this necessity impressed upon me. How far it may be economical to trench on the profits of the green crops, by giving large allowances of extra food, having the mere object of enriching the manure, is a question upon which I am not satisfied. I am aware that circumstances do exist where it may be the most profitable way to obtain manure to sink the whole value of the Turnip crop, by giving large allowances of extra feed. But in my own experience I have found that special manures, given in small quantities, can be advantageously applied to all kinds of crops, in consequence of the mere habits of the plants, forming an important element towards greater certainty of results, independent of the capable condition of the soil. I have thought the previous remarks not out of place, in order that the two-fold object of consuming the Turnip crop may be appreciated, where it is the main reliance for keeping our farms in heart. When an ox or sheep is grazing in a meadow, the complicated function of rumination is most perfectly performed. Nature being complete in all her parts, we cannot doubt but that the more capacious organs of the ox are as capable of extracting as much nutriment from the Grass as that

of the sheep, but we all know that an ox will allow a much larger quantity of nutriment to pass through its organism when fed on unground grain, than the sheep; the preparation of the food of the former is therefore an important matter to be attended to. The digestive organs of the ox and sheep are designed rather to extract nutriment in a diluted and bulky state, than to assimilate it when in too concentrated a form; these animals generally prove grateful when moderate quantities of highly nutritive food are given in such forms as physiologists point out, while they will prove the reverse when it is given in excessive quantities. When lean cattle are put on Turnips in yards or boxes in autumn, and obtain an unlimited supply of Turnips (which is necessary to obtain the regular feeding of the lot, whatever the numbers may be), they will eat a very large quantity; in fact, from the watery nature of the food, more than the system can profitably assimilate. As the season advances they will consume a smaller quantity of roots. I have found cattle of 50 stones imperial, when first put up to feed, eat daily 220 lbs. of cut Swedes, with Oat straw in the racks, and 5 lbs. of oilcake besides. It is a well recognised fact amongst cattle feeders, that it is very unprofitable to give cake or corn to cattle for the first two months they are put on Turnips, which is undoubtedly a weak part of the system when rapid ripeness is required. At this juncture prepared straw can be used in conjunction with cake or grain, as an important auxiliary towards economical results. Mr. Warnes, of Trimingham, in Norfolk, I believe, was the first to bring prominently before the public, the importance of having the extra food thoroughly incorporated with chaff, whereby the latter is rendered palatable, and the extra food is fully subjected to the important process of rumination. The utility of this system is now beginning to be pretty widely acknowledged, and it has been variously wrought out in details. I have followed a modified system of it, for five years, in feeding annually about 40 lean cattle on Turnips with advantage." Instead of giving my cattle an unlimited supply of Turnips in boxes or in stalls, I gave each beast about 1 lb. of cake and 1 lb. ground grain, at 6 A.M., well mixed up with 5 lbs. of 1-inch chaff, the latter having been well wetted with cold water before the cake and grain are thrown in amongst it; by 8 o'clock they have an allowance of 50 lbs. of cut Turnips, and are again fed at noon, and in the afternoon with the same quantities of food. I may here mention that I have found it of great importance to give the mixture before the Turnips in the morning, for, when this has been reversed, the cattle in boxes are sometimes very apt to hoove, when cut Turnips are rapidly swallowed; but when the other is adopted, I have never had a single case of hoove. Besides the quantity of food specified, the cattle have straw in racks, of which they consume very little. I have found this allowance and mode of feeding answer well; and with a little attention and tempering, you may have all the troughs clean swept-out by night-fall, and the animals prepared to rest for the night the most perfect pictures of content imaginable. I do not know how far a more perfect preparation or cooking of the artificial food, having the effect of rendering it more soluble, would compensate for the extra expense involved in the process. By this mode of feeding, 4 or 5 lbs of cake and grain become a substitute for 100 lbs. of Turnips, and it is not putting a high value on the latter when you have the assurance that you are feeding your cattle at as little expense as when they have nothing but Turnips and straw. The comparative rapidity with which cattle will take on flesh, under the different methods, more especially during the first months they are put up to feed, will be apparent to those who will give the two a fair trial. By mixing the artificial food with the more bulky material of chaff, any specified quantity can be more regularly divided amongst a lot of cattle in yards or in boxes, for the stronger soon lose the capacity of cheating their weaker neighbours of their due quota. I think this system holds out an inducement to increase the quantity of stock on farms where Turnips can only be raised over a small part of the occupation; and thus by obtaining a market for the inferior grain (by consuming it on the farm), will, in the end, prove the most economical way of obtaining a better supply of manure, at least it has been so in my own experience. I have never been in the practice of giving more than 4 to 5 lbs. daily, of extra food, in fattening cattle. In regard to the materials used as auxiliary to Turnips in feeding cattle, I am always inclined to keep by oilcake, to the extent of one-half of the whole quantity given, as it tends to make them softer in the skin, and more kindly to handle, than when grain alone is used. I prefer Bean-meal to that of any other kind of corn, but as to this I am not so particular, as the relative prices of grains for the time being determine which can be most economically given. In feeding sheep, the same principles will be found to apply as in the case of cattle; by substituting a portion of grain and straw, the Turnips can be economised, but not to the same extent perhaps as in the case of cattle, as you have less control over the process in the fields. By giving an allowance of palatable and dry fodder to sheep in Turnips in conjunction with the extra food, the per centage of deaths is greatly reduced. When grain was high in price, I certainly did prefer a mixture of oilcake or good rape-cake and grain for sheep, but for three years I have used neither of the former. In 1848 I used chaff, bran, and Oats; last year nothing but Oats cut half-inch out of the sheaf; and at present I am using the same, with the addition of a little inferior Barley for nearly 1000 sheep. I have not kept so rigidly to any substance for feeding as with cattle, for the produce of the farm is always preferred when its value in the market would indicate that other feeding stuffs cannot replace it with advantage, after paying for the extra expense incurred in selling the one and buying the other. The valuable experiments of Mr. Bruce, at Waughton, as detailed in the Highland Society's Transactions (July No., 1846), showed that there was a very small amount of loss in giving sheep Linseed uncrushed, which has been satisfactory to my mind that there is no use in crushing grain, and I therefore always allow them to grind it themselves. I have now gone over the chief points of the system of feeding which I adopt, and it would be out of place to go into further details. The same necessity of circumstances may not exist in others in pursuing a similar mode, for the elements of success in farming are presented to us in such variety, that they will ever give unbounded scope for skill and experience to develope, but he must be a good or bad farmer in the extreme who will not profit by freely discussing agricultural topics with his fellow-labourers, an excellent opportunity for which the directors of the Highland Society, under their zealous secretary, are now affording to the country; and, for my own part, while I always shrink from dictating to any one in practical matters, I have no scruple whatever in arguing the general principles involved in any subject, for their bearings and relations under other conditions are appreciated, and the bounds of our knowledge are extended.—Mr. WILSON, Eddington Mains, Berwickshire, said: The directors of this Society, in their laudable desire to increase the interest and usefulness of their monthly meetings, having adopted the practice of inviting parties from a distance to take part in them, I shall now, in compliance with their request, and as in some sort representing Berwickshire, offer some remarks on the subject under discussion. In endeavouring to answer the inquiry, "What are the substances that can be most profitably employed as auxiliaries to Turnips, in fattening cattle and sheep?" I think it needful to remark, at the outset, that the need for such auxiliaries, as well as the kind and the amount of them, depends mainly upon the amount of nutritive power possessed by the Turnips themselves, and that this is just as various as the soils on which they are grown. The overlooking of this fact has long appeared to me to render nearly worthless the results of those comparative trials which are frequently communicated to the public. In such statements we are, it may be, told how so many animals were fed on specified rations of Turnips alone, and so many more on other substances in addition. Now, although this may be quite conclusive as regards the particular farm, or rather the particular field of the farm, on which the trial is conducted, it determines nothing for the country at large. I know, for example, that Grass or Turnips produced on the best parts of the farm which I occupy, will fatten a bullock better, *per se*, than that from the worst parts, even with a large addition of farinaceous food. The same thing holds good of every product of the soil, so that even the cake or meal used in one case, may differ very greatly in inherent quality, from what is compared with it in another. But not to dwell upon this important consideration, and the fallacies arising from the disregard of it, I may say in the general, that I have not found it profitable to give large quantities of cake or meal per head, to fattening cattle. No doubt the animals improved more rapidly with such food than without it; but then the additional price obtained for them was not in proportion to the extra expense at which they are fattened. The manure, I have reason to think, was greatly enriched by the use of such food; but I must say, that I consider this an expensive way of purchasing foreign manure, and that if much of the return from the fattening of cattle has to be looked for from this source, it is cheaper to buy guano at once. There are, however, circumstances in which I think that it is judicious to add a portion of farinaceous matter to the food of cattle, and I shall specify some of these. I have already hinted, that part of the farm which I occupy is a poor soil. The Turnips grown upon this part I endeavour to consume by sheep, as largely as possible, but to get the straw of the farm made into dung it is necessary to carry a portion of the Turnip crop to the homestead, and that portion I apply chiefly to the rearing of young cattle. Now, as such Turnips are deficient in nutritive power, I think it advisable to add something better, that the young animals fed upon them may not be stunted in their growth. But, independent of this, I have learned, by dear-bought experience, that in rearing calves, I must use Linseed-cake on another account. I need not remind this meeting of the exceeding liability of these young animals to that malignant disease, called *blackleg*. Having kept a memorandum of my own losses, by it I found that in the first 14 years of my farming, they amounted in the aggregate to a number equal to my average annual stock; in other words, that out of 14 crops of calves, I had lost one entire crop by this disease alone. During that period I tried most of the nostrums then in vogue, without any success. I then, however, began to give a daily allowance of oilcake, say 1 to 2 lbs., and ever since my loss has been trifling, with some most instructive exceptions. Having that season a good deal of inferior grain, and having had no blackleg for several years, I thought that a daily feed of meal might be as good for my calves as oilcake, and much cheaper; but, alas! for ill-judged economy, I, that year, lost eight calves in the course of a very few days. I need scarcely say that I have not again ventured to dispense with the use of cake; and I am happy to add that my belief in its efficacy, as an antidote to this disease, has been confirmed by each additional year's experience. Here, then, is one instance in which the economy of using cake, as an auxiliary to Turnips, is clear and indisputable, and all the more that this disease is more prevalent on fertile soils. The cake, in this instance, is *medicine* as well as food, and the economy of the practice rests mainly upon this circumstance. In pursuing such an investigation as we have now in hand, it is necessary to keep in view that Grass or hay constitutes the natural food of the ox, and that his digestive organs are formed with a manifest adaptation to a moderately nutritive and very bulky food. We see that it is indispensable to his comfort that his capacious paunch be kept constantly full, so that even when supplied with food greatly more nourishing than the richest pasturage, he must have his fill before he will go to rest, and proceed with his rumination and digestion. But while he can *eat* nearly as much bulk of the more nutritious food as of other, his power of assimilation is not correspondingly expansive, and hence it happens that enormous waste ensues whenever this law of his physical constitution is disregarded. There is not only a waste of food, but the unassimilated surplus produces disturbance and irritation, issuing very usually in continued diarrhœa, and sometimes in more serious disease. This excessive purging is especially observed when cattle are first put on Turnips, and the poorer their condition the longer does it continue. Several plans have been adopted for avoiding this evil. One is to give them a limited supply of Turnips for some weeks at first, and thus compel them to appease their appetite by eating straw more largely than they would otherwise do. An East Lothian farmer has recently informed me that he has tried this plan with decided success. Something added to the straw to make it palatable, so that the animals will eat it freely, without being starved into compliance, is, I think, an improvement on this plan; for when a considerable bulk of good straw is eaten daily, this injurious purging will not only be avoided, but during the whole process of fattening, a much less quantity of Turnips will suffice than is found necessary in the customary practice. I do not give this as a mere opinion, for—as I recently mentioned to our local club—I have been convinced of it by a rather extensive experiment, which an anticipated scarcity of Turnips induced me to make in the spring of the present year. My cattle at that time were getting as many Swedish Turnips as they could eat, and, in addition, 4 lbs. of Bean and Barley meal, with ½ lb. of bruised Linseed mixed in it, as the daily ration of each animal. This meal was given to them dry every morning. Seeing, however, that my Turnips were to run short before the cattle were ready for market, I was induced by some statements which I met with in the *Agricultural Gazette*, to purchase a straw-cutter, and to add a considerable quantity of chopped straw to their daily fare. To induce them to eat this chopped straw, it was moistened with a soup prepared by soaking the bruised Linseed for 24 hours in cold water, and then sifting the meal over it. When these ingredients had been well stirred, and allowed to lie for a short time, about a bushel of the mixture was served out to each bullock. They all eat it readily on the very first trial, and the effects were, that they made more rapid progress, and were quite satisfied with just half their former allowance of Turnips. In confirmation of what I have now stated, I may mention that a friend of mine, who is a very successful Beet grower, tells me that by giving his cattle a daily feed of grey-dust (the refuse from Oatmeal grinding), they are benefited, and a considerable saving of Turnips effected. Those who have read the Rev. Mr. Huxtable's pamphlet, are aware of the success with which he has carried out this principle. If I have rightly understood his statement, it would appear that by passing Turnips or Mangold Wurzel through a machine which rasps and crushes rather than cuts them, and then mixing chopped straw with the roots thus prepared, that he gets his cattle to eat a sufficient quantity of the chaff, without having recourse to Linseed or other meal at all. If this is the case, I regard it as the most important improvement yet made in cattle feeding; as on really good soils, the process might thus be conducted without using the farinaceous food, until the animal had nearly reached maturity. A small allowance of cake or meal for a few weeks before selling might, I think, still be advantageous; but to use these costly substances during the whole process of fattening, unless in the manner and for the object which I have endeavoured to describe, cannot, I think, be profitable. On weak soils it may be impossible to fatten a bullock without them; but this just suggests the inquiry, whether the occupiers of such soils would not do better by restricting themselves to such departments of cattle husbandry, as seem more suitable to their circumstances. We know in regard to sheep, that the occupiers of high lying or poor soil invariably part with their lambs as soon as weaned; that is to say, when they have brought them to the point at which they would cease to improve in their own hands, they sell them to those who can carry them forward to maturity. When we consider the advanced ages to which parties similarly circumstanced usually keep their cattle, and the state of gaunt leanness in which they come into the hands of the low country grazier, to the manifest loss of both parties, it will appear how desirable it is that the same principle now so generally adopted in regard to sheep,

should be applied also to cattle. For a few years past, I have with great satisfaction observed, that this more rational practice is decidedly on the increase. Large numbers of young stock are now brought to market either as weaned calves, yearlings, or year-and-half olds, as best suits the circumstances of the respective breeders; but all acting on the common principle of bringing their stock to market in good condition, and of parting with their annual cast at the age when the natural produce of their farms would no longer keep them improving. To such an audience as I now address, I need not insist on the difference to the ultimate fatteners—and I might add to the consumers—betwixt cattle that have been steadily improving from their birth, and such as have at some stage been starved and hunger-bitten. I have hitherto confined my remarks to the treatment of cattle, but the same principles apply in good measure to sheep. The consuming of Turnips on the land where they grow by these invaluable animals, has now of a long time been fully established as the best way of enriching and improving all dry poor soils, as in fact the key to the profitable cultivation of such lands. I have not hitherto made a regular practice of giving cake or grain to my sheep, but have had recourse to it on occasional emergencies, as when Turnips have run short in spring before Grass was ready; when Grass has failed from untoward weather; or when it has been necessary to graze them on pasture inferior in nourishing power to what they have previously had. By giving a small daily allowance of grain or cake, a larger head of stock can with safety be grazed on a given area, than would otherwise be the case, and a poor soil may in this way be much improved for the future crops. The quiet way in which sheep feed together, and the facility with which their feeding troughs can be shifted, render it practicable to distribute the extra manure thus applied equally over the area of a field. I think that a portion of the inferior grain of the farm may be profitably disposed of in this way, and that if used in small quantities, Linseed-cake will, upon the whole, yield a better return when eaten by sheep than by cattle. I believe that in England it is a common practice to give chopped hay to sheep when on Turnips, either with or without an admixture of cake or grain, and it is one which we might, perhaps, imitate with advantage. In the case of hoggets in particular, it might, perhaps, be a means of preventing the serious mortality which often occurs when they are first put on Turnips. In giving grain to our domestic animals, and especially to ruminants, I think it of great importance to have it bruised or ground. For cattle, in particular, it cannot be too finely ground, as, when this is not done, I am persuaded that much of it passes through them undigested. Let me say, in conclusion, that I think much caution should be exercised in giving farinaceous food to fattening cattle, as I am convinced that beyond what is necessary for securing the indirect advantages which I have endeavoured to describe, we shall find it more profitable to sell our grain *as grain*, than by first converting it into beef or mutton.—Dr. Anderson said: After the extremely valuable observations which had been brought before the meeting by the gentlemen who had preceded him, it would scarcely be expected, nor indeed was it necessary, that he should occupy the time of the meeting at any great length. The subject, however, was of peculiar interest, as it was one on which science and practice could meet together on a common field; and it was very gratifying to find, from the observations of the gentlemen who had spoken, that those plans which they had found by experience to be best fitted for fattening stock were exactly those which were consistent with the principles of science. He would not, of course, attempt to enter there into the whole question of feeding stock, which would be very much out of place, and would occupy by far too much of their time; but there were some subjects touched, which he thought worthy of observation. It was remarked by the first speaker (Mr. Brodie) that the subject was one on which they had, as yet, comparatively little definite experiment. This was to a certain extent true; there still remained a great deal to be done. Experiments, however, of a certain kind had been made, but the result had just been—as, indeed, in most similar cases—to show them that something more was required. Having made one class of experiments, they found that more precise experiments were necessary to decide the question. They had already a large amount of valuable experience; but the time, he thought, was now come when they must proceed to much more definite experiments, in order fully to exhaust the subject of the feeding of stock. He had himself been engaged for some time past, in the laboratory, on a series of investigations, which touched to a considerable extent on this subject, in endeavouring to determine, as far as possible, the comparative value of different sorts of food, on chemical principles. This had been done by determining the quantities of nitrogen and oil entering as constituents into the different substances employed as food, and he had got a table from which he would quote some points, as containing facts of considerable interest. From what they had heard to-day, the universal experience seemed to be in favour of oilcake and Bean-meal; and he believed these were the substances which possessed the highest feeding value upon scientific analysis. He had determined, in the table he held in his hand, the amount of nitrogen and of oil or fatty matter in each of the substances experimented upon; and he found that in a ton weight of Beans, there were 99 lbs. of nitrogen, and 32 lbs. of oil—these being the most valuable substances; but in purchasing a ton of oilcake, the purchaser got 103 lbs. of nitrogen, and 224 lbs. of oil. The value of Rape-cake was quite equal to that of oilcake on chemical principles. There were, however, some important questions to be considered in addition to the quantities of nitrogen and oil, for the fact was that the whole of these substances given to cattle was not converted into flesh and fat, and the question arises—How much of the nitrogen present in the different sort of food was converted into flesh and fat? This was a question which could not be determined by laboratory experiments, or, at least, only to a certain extent. They must experiment upon the cattle. Suppose that they gave a certain quantity of nitrogen to cattle in the shape of oilcake, Beans, or any other kind of food, the question to be determined was—What proportion of the whole nitrogen given was converted by the cattle into flesh? That was a point on which the comparative value of different substances very much depended. He thought that cattle could be shown to convert into flesh the largest amount of nitrogen, where it was in the most digestible condition, or where it was in a state to be taken up by the organs with the greatest possible rapidity. He found, in the nitrogen of oilcake, about nine-tenths was soluble in water, and of Turnips about three-fourths; and he apprehended that whatever might be the exact amount of difference, this was a thing which could be determined by experiment, and that which was soluble was more likely to pass into the system, than that which was insoluble. That, however, was a subject on which they knew almost nothing. He would not attempt to enter into further detail on this subject, except to notice one point in the discussion. One of the gentlemen who had spoken (Mr. Wilson) stated that he found his calves did not thrive without the use of a certain quantity of oilcake. He (Dr. A.) presumed the calves were, in this case, newly weaned, the food being different from that to which they had been accustomed. The milk contained a very large quantity of fatty matter, essential to the sustenance of the young animal, but when it came to be fed on Turnips or Grass it got food containing a comparatively small quantity of oil, and the consequence was that it could not digest this sort of food in the same way as that which nature had provided for it. He was able to confirm the statement made by one of the speakers, that the value of Turnips differed very much in different circumstances—to a greater extent, he found, than was generally imagined; and it was to be remarked that the difference was in some sort connected with the soil. He had analysed Turnips from the Carse of Gowrie, grown on what was called the black land in that neighbourhood, and he found them of a very superior description; and, indeed, a heavy clay land appeared to be unsuited for their proper cultivation. The introduction and extended use of beneficial foods was of very great importance, and deserving of attention from other quarters besides the agriculturist. There must exist many other substances which might be usefully employed for feeding cattle. He had analysed the cake of a considerable number of seeds, and he found that Poppy-cake was rather more valuable than the average of Linseed-cake in nitrogen, but the oil was only about one-half. He found Hemp-cake to be about the value of oilcake in nitrogen, and rather less in oil. Cotton-cake was somewhat inferior in point of nitrogen and oil. He had also recently analysed a cake imported under the name of Cramboline cake, which nobody could make anything of, but which he found near oilcake in value.—Mr. Melvin, Bonnington, said: That as the system of feeding which had been recommended to the meeting was very different from what had been generally adopted in the Lothians, perhaps Mr. Kennedy or some other gentleman would be able to state whether they had made any comparative experiments on the different systems, so that the actual results were determined in such a way as to warrant farmers to adopt the plan recommended. These were not days when farmers could afford to conduct experiments, without being somewhat sure of the results.—Mr. Kennedy said: The system he had recommended had been followed by him for a great number of years, and he was satisfied it was the most profitable one.—The noble Chairman suggested that Mr. Melvin might state to the meeting the system he adopted.—Mr. Melvin, said: The food he gave to his stock depended very much on their condition. At first, when the animal was put up, if he was lean, the digestive system having been accustomed to very innutritious food—the strong properties having gone out of the Grass towards the close, of the year, he gave him fully more than 2 cwt. of Turnips; and as the season advanced, and the digestive system became suited to digest food more thoroughly, he found the quantity of Turnips consumed decreased, and as the animal progressed to a state of fatness, he found 1¼, or 1½ cwt. of Turnips sufficient.—The noble Chairman said: There could be no doubt that Mr. Kennedy and the other gentlemen who had read papers were able to verify their statements by their own experience, and were satisfied of their truth by the experiments they had made themselves; and he could not help taking that opportunity of remarking the great merit of all the papers which had been read to the Society. The greatest merit of each and all of these papers was their thorough practical nature, and the statements were brought forward in a manner which did these gentlemen the greatest honour. They were highly valuable to the public, and to those to whom they had been addressed; and being based both on practical and scientific experience, would no doubt lead to very important consequences in regard to the subject which had been discussed.—Mr. C. Stevenson explained that Mr. Howden, of Lawhead, who had been long before the public as one of the leading agriculturists of East Lothian, and whose experience embraced a practice of 60 years, had intended sending a paper on this important subject, but had been prevented by domestic circumstances. He begged to state, as the general results of Mr. H.'s experiments on feeding, that prepared food for cattle was unprofitable, the results of which experiments appeared in the Society's Transactions—that grains, especially when mixed, are of equal value, weight for weight, with cake—and that other substances can be profitably employed as auxiliary to Turnips.

Notices to Correspondents.

Books: *Subscriber.* Can any one recommend a book upon the manufacture of malt?

Bone-Dust: *Novice.* Apply 16 bushels per acre now on your Grass land, broadcast.

Carey's Cattle Gauge: *C A S.* Any philosophical instrument-maker will procure it. A few shillings, with the tape.

Clover: *Ackham.* Cart over the farm manure as a compost with earth during the last frosts of winter. It should be made into a compost with earth, and turned once or twice before reading it.

Compost: *An Old Subscriber.* You would injure the compost by adding lime to peat and rotten fish. Get gypsum to dry it up with. You can get it for 30s. a ton.

Flax: *C F.* There are many good books. Read T. Keir Short's sixpenny pamphlet.

Gas Lime: *Kent.* It contains sulphuretted hydrogen, and is therefore poisonous to insects. In that state it is also poisonous to plants; you should therefore apply it fresh only on bare lands. If you wish to use it as a top-dressing for crops, it must be exposed to the air for a long time first, and it will become a mixture of gypsum and chalk. You may apply one to two tons per acre.

Grass for Land Shaded with Trees: *Tristram.* Agrostis vulgaris, 2 lbs.; Anthoxanthum odoratum, 1; Dactylis glomerata, 7; Festuca sylvatica, 1½; Lolium perenne, 8; Poa nemoralis, 4; P. trivialis, 4; Trifolium repens, 3; total 32 lbs. and 1 bushel of Barley per acre.

Pigs: *J D.* Mangold Wurzel is the most profitable crop to plant for them. We do not know anything about house and window, or any other taxes here. Your question must be addressed to one learned in the law. You should "pound" the geese and detain them for damage. Leave the clay land once ploughed till spring.

Rats: *Cliftonian.* The pamphlet recommends a particular breed of terrier, as the best preventive. Any bookseller will obtain it. We do not know the publisher.—*Subscriber.* You must apply to your bookseller. We have not a copy, and do not know the publisher.

The most Economical Fence: *Rurigola.* We should suppose a post and rail fence put up cheaply; but it is impossible to say, because the question of cheapness depends altogether upon the nature and products of the locality.

Unfeathered Chickens: *H B, Monkton.* There are several breeds, all large fowls, the chickens of which feather as slowly as you describe; we cannot, therefore, answer your question without a sight of the birds, or a much more precise description. You should get some good treatise on poultry, and study it.

Markets.

COVENT GARDEN, Dec. 28.

Notwithstanding the increased trade which has taken place during the week, hothouse Grapes and Pine-apples are quite equal to the demand, and the same thing may be said of Apples and Pears. Oranges and Lemons are plentiful. Nuts have not altered since our last account. Amongst Vegetables, there have been some excellent Seakale, Asparagus, and Rhubarb. French Beans are cheaper. Carrots and Turnips are good in quality, and so are Potatoes. The latter are getting dearer. Lettuces and other salading are sufficient for the demand. Mushrooms are cheaper. Cut Flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Tulips, Double Primroses, Gardenias, Bignonia venusta, Chrysanthemums, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Pommegranates, each, 3d to 6d
Grapes, hothouse, p. lb., 4s to 6s	Almonds, per peck, 6s
— Portugal, p. lb., 8d to 1s	— sweet, per lb., 2s to 3s
Pears, per doz., 1s to 3s	Chest nuts, per peck, 2s to 5s
— per half sieve, 6s to 15s	— per 100, 9d to 1s 6d
Apples, dessert, p. bsh, 3s 6d to 8s	Nuts, Barcelona, p. bush., 20s to 22s
— kitchen, do., 3s 6d to 6s	— Brazil, p. bsh., 12s to 14s
Oranges, per doz., 9d to 2s	Filberts, per 100 lbs., 60s to 65s
— per 100, 6s to 10s	
Lemons, per doz., 1s to 2s	

VEGETABLES.

Brussels Sprouts, per hf. sieve, 1s 6d to 2s	Leeks, per bunch, 1d to 2d
Cabbages, per doz., 6d to 1s	Shallots, per lb., 6d to 8d
Greens, p. doz. bun., 1s 6d to 2s 6d	Garlic, per lb., 4d to 6d

COAL MARKET.—FRIDAY, Dec. 27.

Hollywell, 15s. 6d.; Carr's Hartley, 14s.; Eden Main, 15s. 9d.; Tanfield Moor, 14s.; West Hartley, 14s. 6d.; Wallsend Haswell, 17s.; Wallsend Stewart's, 17s.; Wallsend Tees, 17s.—Ships at market, 303.

POTATOES.—SOUTHWARK, Dec. 23.

The Committee report that there have been very large arrivals from Yorkshire and Scotland during the last three days. As this large fleet has so recently arrived, it is impossible to give an opinion as to what prices they will go at. The following are this day's quotations:—York Regents, per ton, 90s. to 100s.; Scotch do., 65s. to 80s.; ditto Cups, 65s. to 70s.; Wisbeach Regents, 70s. to 90s.; French whites, 70s. to 80s.

SMITHFIELD, MONDAY, Dec. 23.

As is usual on the Monday following the "Great Market," our supply, both of Beasts and Sheep is small to-day, so also is the demand. We have a cheerful trade for good qualities that are not too big, but for those descriptions of things it is very heavy, the butchers generally having already procured sufficient of this kind. Very good Calves are in demand, at a small advance. Our foreign supply consists of 212 Beasts, 1930 Sheep, and 91 Calves.

Per st. of 8 lbs.—s	d	s	d	Per st. of 8 lbs.—s	d	s	d
Best Scots, Herefords, &c. ...	3	8 to 4	0	Best Long-wools .	3	6 to 3	8

				Pigs	3	0 — 4	0

Beasts, 996; Sheep and Lambs, 9110; Calves, 115; Pigs, 280.

FRIDAY, Dec. 27.

This may be termed a holiday market. The Christmas abundance not being yet cleared off there is a very small demand, and fortunately also a small supply here to-day. For Beasts and Sheep our quotations remain unaltered, but for choice Calves trade is brisk, at an advance of fully 2d. per 8 lbs. The foreign supply consists of 17 Beasts, 370 Sheep, and 94 Calves; there are 70 milch cows from the home counties.

Per st. of 8 lbs.—s	d	s	d	Per st. of 8 lbs.—s	d	s	d

MARK LANE.

MONDAY, Dec. 23.—The supply of Wheat both English and foreign last week was much larger than of late; this morning the show by land carriage samples from the neighbouring counties was moderate, fine dry samples barely obtained late rates: out of conditioned and secondary descriptions were a slow sale at a reduction of 1s. to 2s. per qr.; business in foreign was exceedingly limited, but we do not alter our quotations.—With the exception of foreign grinding, all sorts of Barley must be written 1s. per qr. cheaper.—Beans and Peas are 1s. per qr. lower.—Oats were in less demand this morning, and Scotch, of which the arrival was unusually large, are obtainable at a reduction of 6d. per qr.

FRIDAY, Dec. 27.—The arrivals of all articles, both English and foreign, since Monday, have been moderate; this morning's market was very thinly attended, and Wheat of all kinds was held nominally at late rates, at which only a few retail sales could be effected.—Barley of all descriptions must be written 6d. to 1s. per qr. cheaper.—In Beans or Peas no alteration. Oats are the turn lower, more especially Scotch, which the supply continues large.

LIVERPOOL, FRIDAY, DEC. 20.—At our market this morning no lively features were visible in any of its departments. The millers and dealers remained exceedingly inactive, and very few sales of Wheat were made for consumption; importers, however, firmly resisting any further decline, the reduced rates of Tuesday were obtained. Barley, Malt, Beans, and Peas, appeared to attract little notice, and barely sustained less prices. Oats being in slow request, declined 1d. to 1d. per 45 lbs.; and Oatmeal, upon a limited demand, merely supported its previous value. Indian Corn, meeting few inquiries to-day for Ireland, receded 6d. per qr., which, on the part of holders, was not generally complied with. —— TUESDAY, Dec. 24.—Although a tolerable number of buyers appeared at our market to-day, the downward tendency in London yesterday, and a good display of samples on the stands here, discouraged any active proceedings, and for all descriptions of Wheat we have to note a limited sale, on terms scarcely equal to those of last week, holders still resisting any material abatement. Malting Barley and Malt, upon a fair demand, were steady in value; grinding Barley unvaried. Beans and Peas, meeting little inquiry, were the turn cheaper. Owing to the abundant supply of Oatmeal, new Oats moved sparingly at a decline of 1d. to 2d. per 45 lbs. from the rates of this day se'nnight, and the former receded 6d. per load. The trade for Indian Corn was firm.

BOTANICAL WORKS BY PROFESSOR LINDLEY.

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY.

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24s. cloth,

INTRODUCTION TO BOTANY.

By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structure of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30s. in cloth.

*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2s. 6d. each.

THE ELEMENTS OF BOTANY, Structural, Physiological, and Medical. With a Sketch of the Artificial Methods of Classification, and a Glossary of Technical Terms. Price 12s. cloth.

The Glossary may be had separately, price 5s.

This will complete the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

CONTENTS.

PART I.—Chap. 1. General Attributes—2. Of the Elementary Organs—3. Of the Epidermis and its Processes—4. Of the Compound Organs—5. Of the Root—6. Of the Stem—7. Of the Leaf-Buds—8. Of the Leaves—9. Of Food and Secretions—10. Of the Motions of Fluids—11. Of the Flower-Bud—12. Of the Inflorescence—13. Of the Floral Envelopes—14. Of the Male Organs—15. Of the Disk—16. Of the Female Organs—17. Of the Receptacle of Torus—18. Of the Ovule—19. Of Fertilisation—20. Of the Fruit—21. Of the Seed—22. Of Germination—23. Of Flowerless Plants.

PART II.—Chap. 1. Linnæan Sexual System—2. Analyical Method—3. The Manner of Studying.—Glossary

*** The Elements of Medical and Œconomical Botany, illustrated with numerous diagrams and woodcuts, is now ready.

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.

This day is published, in one vol. 8vo, with numerous woodcuts price 14s.

MEDICAL AND ŒCONOMICAL BOTANY; or, An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

SCHOOL BOTANY; or, the Rudiments of Botanical Science. New Edition. 400 Illustrations. Price 5s. 6d.

Just published, in demy 8vo, price 2s. 6d.

ORCHIDACEÆ LINDENIANÆ; or, Notes upon a Collection of Orchids formed in Colombia and Cuba, by [illegible] J. LINDEN. By JOHN LINDLEY, Ph. D., F.R.S. and L.S., Professor of Botany in the University of London, and in the Royal Institution of Great Britain.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

Incorporated by Act of Parliament, 12 and 13 Vict. c. 91.
With limited Liability to Shareholders.
Capital—£100,000, in Shares of £20 each.

Directors.

HENRY KER SEYMER, Esq., M.P., Hanford, Dorset—Chairman.
JOHN VILLIERS SHELLEY, Esq., Maresfield Park, Sussex—Deputy-Chairman.
William Cubitt, Esq., Great George-street, Westminster
Henry Currie, Esq., M.P., West Horsley, Surrey
Thomas Edward Dicey, Esq., Claybrook Hall, Lutterworth
William Fisher Hobbs, Esq., Boxted Lodge, Colchester
Edward John Hutchins, Esq., M.P., Eaton-square, London
Samuel Morton Peto, Esq., M.P., Great George-street
Francis Pym, Esq., The Hassells, Biggleswade, Beds.
Colonel George Alexander Reid, M.P., Bulstrode Park, Bucks.
William Tite, Esq., F.R.S., Lowndes-square, London
William Wilshere, Esq., The Frythe, Welwyn, Herts

Bankers.

Messrs. Currie & Co., 29, Cornhill, London.

Solicitors.

Messrs. Bircham, Dairymple, and Drake, Parliament-street.
Messrs. Hoddings, Townsend, and Lee, Salisbury.

Central Engineers and Surveyors.

Messrs. J. Bailey Denton and Henry Drake.
(Assisted by eminent Local Surveyors).

Secretary.

WILLIAM CLIFFORD, Esq.

Temporary Offices—No. 46, Parliament-street, Westminster.

The Powers of the Company enable the owner of a Limited Interest in Land, by a cheap and simple process, to carry out every kind of permanent Improvement thereon, either by the application of his own or the Company's funds, secured by a terminable yearly charge on the Inheritance; but the absolute owner of the freehold may enter into any agreement with the Company for the exercise of any of its powers, machinery, or resources.

The powers of the Company may be thus enumerated:—

1. To execute all works of Drainage (including Outfalls through adjoining Estates), Irrigation, Reclaiming, Enclosing, and otherwise improving Land.

2. To erect Farm Homesteads, and other Buildings necessary for the cultivation of land.

3. To execute Improvements, under contract, with Commissioners of Sewers, Local Boards of Health, Corporations, Trustees, and other public bodies.

4. To purchase Lands capable of Improvement, and fettered by restrictions of Entail, and having executed the necessary works, to resell them with a title communicated by the Company's Act.

The terms on which the remaining Shares will be allotted are a deposit of 1*l.* per Share, with a liability to be called on for the remaining amount by Instalments not exceeding 2*l.* 10*s.* per Share, at no closer intervals than 3 months. Not more than 10*l.* per Share is likely to be called for during the next two years. The liability of every Shareholder is clearly limited to the amount of his Subscription.

Application for further information, or for allotment of Shares, may be made to the Directors, Solicitors, or Secretary.

WILLIAM CLIFFORD, Secretary.

SECOND EDITION, REVISED AND ENLARGED,
Price 5s. 6d., cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.

The Birds treated of are

Domestic Fowl in general	The Musk Duck	The Golden and Silver Hamburgh
The Guinea Fowl	The Grey China Goose	Fowls
The Spanish Fowl	The White Fronted or Laughing Goose	The Cuckoo Fowl
The Speckled Dorkings	The Wigeon	The Blue Dun Fowl
The Cochin-China Fowl	The Teal and its congeners	The Lark-crested Fowl
The Malay Fowl	The White China Goose	The Poland Fowl
The Pheasant Malay Fowl	The Tame Duck	Bantam Fowls
The Game Fowl	The Domestic Goose	The Rumpless Fowl
The Mute Swan	The Bernicle Goose	The Silky and Negro Fowls
The Canada Goose	The Brent Goose	The Frizzled or Friesland Fowls
The Egyptian, or Cape Goose	The Turkey	
	The Pea Fowl

London: J. MATTHEWS, 5, Upper Wellington-street, Strand; and may be ordered of all booksellers.

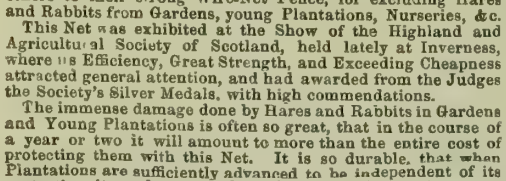
GRAY AND ORMSON,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]



Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

AGRICULTURAL EDUCATION.

MR. HUGH RAYNBIRD has a Vacancy for a Pupil, who would have the opportunity of acquiring a knowledge of Farming, the Management of Woods, Planting, Building, and the general business, as carried on upon a large Estate in the South of England.—For particulars, direct to Mr. HUGH RAYNBIRD, Laverstoke, Andover-road, Hampshire.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

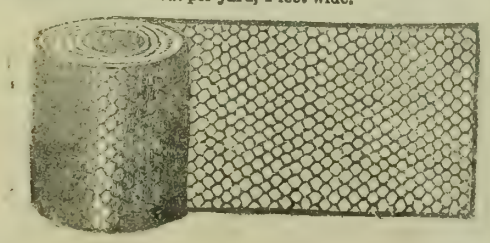
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	.. ..	5 0 0
Do. of 100 yards, 30 ins. wide	.. ..	6 5 0
Do. of 100 yards, 36 ins. wide	.. ..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

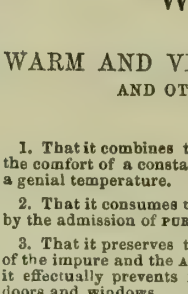
C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
¾-inch " light " ...	8 "	6 "
1¾-inch " strong " ...	10 "	8 "
1¾-inch " extra strong " ...	14 "	11 "



All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

J. E. DOWSON, 123, OXFORD-STREET

(FIVE DOORS WEST OF REGENT-CIRCUS),

Is the Sole Manufacturer of the

PRIZE STOVE OF 1850,

Now Exhibiting in the Model Room of

THE SOCIETY OF ARTS,

John-street, Adelphi, London;

AND IS UNQUESTIONABLY THE

CHEAPEST STOVE IN THE MARKET.

IT HAS ALREADY BEEN EXTENSIVELY ADOPTED, AND IS KNOWN AS

CUNDY'S PATENT IMPROVED OPEN FIRE-PLACE, WARM AIR, VENTILATING STOVE.

IT IS ADMIRABLY ADAPTED TO

WARM AND VENTILATE CHURCHES, CHAPELS, VESTRIES, SCHOOL-ROOMS,

AND OTHER PUBLIC PLACES, HALLS, DINING-ROOMS, LIBRARIES, CLUB-ROOMS, &c.

THE ADVANTAGES OF THIS STOVE ARE—

1. That it combines the CHEERFULNESS of an open fire with the comfort of a constant supply of Fresh Atmospheric Air of a genial temperature.

2. That it consumes the IMPURE air of a room and replaces it by the admission of PURE air from without.

3. That it preserves the BALANCE between the CONSUMPTION of the impure and the ADMISSION of pure air so accurately that it effectually prevents BLASTS of cold air through crevices in doors and windows.

4. That it never raises the temperature of the air, which is warmed by passing through the stove, so high as to burn it, or impart to it any UNPLEASANT SMELL or INJURIOUS PROPERTIES.

5. That it imparts so large a proportion of its heat to the air in its passage into the room through it, that the SMOKE FLUE can never get so heated as to endanger the building, or to add to the risk in insuring.

6. That as nearly all the heat produced by the fire passes with the air into the room, and very little up the flue, it obviously economises the fuel.

The ADVANTAGES of CUNDY'S PATENT STOVES, therefore, are CHEERFULNESS and COMFORT, PURITY and WARMTH of the Air, the Absence of any Noxious Properties, FREEDOM from DANGER, and ECONOMY of FUEL.

Letter from the Rev. MATTHEW O'BRIEN (Professor of Natural Philosophy and Astronomy), M.A., F.R.S., &c., King's College.

I beg to certify that one of Mr. Cundy's Patent Stoves was put up in my Lecture Room, at King's College, last year, in place of a Common Stove (of Arnott's construction I believe). I have no hesitation in saying, from actual experience, that Mr. Cundy's Stove is far superior both in producing warmth over the whole room, and in promoting ventilation, without disagreeable currents of air, or close smell.

MATTHEW O'BRIEN.

From GEORGE HITCHCOCK and ROGERS, St. Paul's Churchyard.

St. Paul's Churchyard, March 7, 1850.

Dear Sir,—We have never had occasion to regret the substitution of your excellent Stoves for the hot-water apparatus with which our establishment was previously heated; all our customers seem delighted with the change.

The improved ventilation produced by them—the entire freedom from that smell of iron so common to most other stoves, and the agreeable sight of the fire—render them most desirable for such establishments as ours.

We are, dear Sir, yours truly,

GEORGE HITCHCOCK AND Co.

The STOVES may be obtained of the Sole Manufacturer, J. E. DOWSON, 123, Oxford-street (five doors west of Regent-circus), where a Stove is in constant operation. They may also be seen at Messrs. HITCHCOCK and ROGERS, St. Paul's Churchyard; and in the Model Room of the Society of Arts, Adelphi; from which Society Mr. CUNDY, on the 22d July, 1850, received their large SILVER MEDAL for the invention.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S-ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot.

HEATING BY HOT WATER.

GARDENERS' CHRONICLE.—To be SOLD, a Set from the commencement, in 1841, to the end of 1849. All well bound, half-calf, and in perfect condition. Lowest price, 9*l.*—Address, J. M., Office of this Paper.

On the 1st of January, 1851, will be published, Part I., price 7*d.*, and No. I., price 1½*d.*, of a

COLLECTED EDITION OF THE

WRITINGS OF DOUGLAS JERROLD.

The Series will commence with the History of

ST. GILES AND ST. JAMES,

And hereafter a Number will be published every Wednesday and a Part on the first of every month, until complete.

London: Published at the Punch Office, 85, Fleet Street; and sold by all Booksellers in Town and Country.

This day is published, price 3*s.* 6*d.* in cloth,

THE LIFE AND DEATH OF LITTLE RED RIDING-HOOD. A Tragedy, adapted from the German of Ludwig Tieck. By JANE BROWNING SMITH, with Seven Illustrations by JOHN MULREADY.

GROOMBRIDGE and SONS, Paternoster-row.

THE MIDLAND FLORIST AND SUBURBAN HORTICULTURIST. Edited by J. F. WOOD, F.H.S., the Coppice and St. Ann's Well Nurseries, near Nottingham. The First Number of the Fifth Volume will appear, on the 1st of January, 1851, price 3*d*, and may be procured of all Booksellers, or it may be had free by post, on pre-payment of 4*s.*, to Mr. RICHARD SUTTON, *Review* Office, Nottingham.

Vols. I., II., III. and IV., cloth-lettered, 4*s.* 6*d* each, and cloth covers for binding the MIDLAND FLORIST, 1*s.* each, may be obtained to order of any Bookseller in the United Kingdom.

The MIDLAND FLORIST is extensively circulated amongst purchasers of Flowers, Trees, Seeds, Garden Implements, and books on Horticultural subjects. To Advertisers it is therefore a most desirable medium at a very moderate price.

All communications, letters, parcels, books for reviews, &c., &c., may be forwarded, post paid, direct to the Editor, at the Coppice, near Nottingham.—Advertisements, with the payment thereof, should be sent to the printer, Mr. SUTTON, *Review* Office, Nottingham.

London: SIMPKIN, MARSHALL, and Co.; Nottingham: R. SUTTON; and all Booksellers.

Just published, Third Edition, price 1*s.* 6*d.*,

A TREATISE ON THE CULTIVATED GRASSES and OTHER HERBAGE and FORAGE PLANTS; with the Kinds and Quantities of Seeds recommended for Sowing down Land to Alternate Husbandry, Permanent Pasture, Lawns, &c. By PETER LAWSON and SON, Edinburgh, Seedsmen to the Highland and Agricultural Society of Scotland.

WILLIAM BLACKWOOD and SONS, Edinburgh and London.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, DECEMBER 28.
